# INTRODUCTION

---

**F**IVE generations have come and gone since the publication of the First Edition of the *Encyclopaedia Britannica*. Other editions followed until today we have the latest or 14th. The interval in time between these editions was naturally considerable, and no device was employed to fill the gap. Such a procedure was satisfactory in an age that was more or less static, in which knowledge increased slowly and progress was made at what today would seem a snail's pace. But such a procedure is not suited to the present dynamic era when knowledge increases at an ever faster pace, when technical and scientific progress and economic change in a single year are often as great as in an entire decade of an earlier century.

The *Britannica Book of the Year* bridges the gap between editions. It answers demands on the part of the public for an authoritative handbook recording what has happened in a single year. It consolidates and summarizes the significant facts, whether statistical or historical, of the year. And, most important, it keeps up to date the sets of the *Britannica* in the hands of the public.

Following the great tradition of the *Encyclopaedia Britannica*, this *Book of the Year* has been written by scholars, scientists, experts, and men of affairs. A glance at the pages immediately following, bearing the names of the principal writers for this volume, will show at once that the *Britannica Book of the Year* is, in scholarship and authority, of the same high standing as the *Encyclopaedia Britannica*. In fact, it would seem that no other single volume has ever enjoyed the co-operation of so many men and women of distinguished reputation. Practically every article is signed.

Believing in the importance of pictures, the editors have insisted on lavish illustration at all points where illustration is useful. The whole field of contemporary photography has been searched in order to obtain the photographs which best illustrate the events and personages of the year 1937.

The *Britannica Book of the Year* is not intended solely for those who own the *Encyclopaedia Britannica*. It is intended for all those—expert and layman alike—who seek accurate present day facts and statistics, and an authoritative and reliable account of what happened in the year preceding its publication.

FRANKLIN H. HOOPER, *Editor*  
WALTER YUST, *Associate Editor*

# EDITORS AND CONTRIBUTORS

FRANKLIN H. HOOPER, EDITOR OF ENCYCLOPAEDIA BRITANNICA  
WALTER YUST, ASSOCIATE EDITOR OF ENCYCLOPAEDIA BRITANNICA

## LIBRARIAN CONSULTANTS

ANNE FRASER LEIDENDEKER, *Department Librarian, Science and Industry Department, Public Library, Los Angeles, Calif.*  
CHARLES F. MCCOMBS, *Superintendent, Main Reading Room, New York Public Library.*  
WINIFRED VER NOOY, *Reference Librarian, University of Chicago.*

(Initials and names of contributors to the Britannica Book of the Year with the principal articles written by them. The arrangement is alphabetical by initials.)

<b>A.A.C.</b>	<b>ALBERT A. COCK.</b> Vice-Principal and Professor of Philosophy and Education, University College of Southampton.	<b>Elementary Education</b> ( <i>in part</i> )

# 1938-CALENDAR-1938

THE year 1938 of the Christian Era corresponds to the year of Creation 5698-99, of the Jewish Calendar; to the year 1356-57 of the Mohammedan Hegira; to the year 2598 of the Japanese Empire; to the 162nd of the United States; and to the 170th year of the *Encyclopædia Britannica*.

A world-wide movement in favour of a scientific and uniform measurement of time is resulting in the increased use of the Gregorian Calendar in Asia and the adoption of the New or Gregorian Style in countries previously continuing to use the Julian or Old Style. There

is a proposal to adopt a calendrical year of 364 days, adding a Year Day after Dec. 30 and, in Leap Year, a Leap Day after June 30. Such a 364-day year is divisible into four equal and uniform quarters of 91 days each or 13 weeks, the months in each quarter running to 31, 30 and 30 days. Alternatively, the 364-day calendrical year can be divided into 13 equal and uniform months of 28 days or 4 weeks. There is also a proposal for a fixed Easter. This would end the inconvenience due to movable feasts in the ecclesiastical, legal and educational calendars, particularly in Great Britain.

Jan. 1 New Year's Day.  
Jan. 1 Jewish Feast of Tebet.  
Jan. 6 Epiphany, or Twelfth Night.  
Jan. 11 English Law Sittings: Hilary Term begins.  
Jan. 17 Birth of Benjamin Franklin, 1706.  
Jan. 18 Birth of Daniel Webster, 1782.  
Jan. 19 Birth of Robert E. Lee, 1807.  
Jan. 21 Birth of "Stonewall" Jackson, 1824.  
Jan. 22 U.S.S.R. Anniversary of Lenin's Death (Jan. 21, 1924). Birth of Francis Bacon, 1560-1.  
Jan. 24 Birth of Frederick the Great, 1712.  
Jan. 27 Birth of Mozart, 1756.

Dec. 27 Birth of Pasteur, 1822.  
Dec. 28 Birth of Woodrow Wilson, 1856.  
Dec. 29 Birth of Gladstone, 1809.

# CALENDAR OF EVENTS, 1937

- Jan. 1, 1937: **New Year's Day.** The ancient Egyptians began their New Year at the autumnal equinox (September 21); the early Greeks and the Romans at the winter solstice (December 21), until Julius Caesar by the adoption of the Julian calendar postponed it to January 1st. Throughout the middle ages the 25th of March was the usual date among most Christian people. The Julian calendar was not altogether accurate with the result that by 1583, it was too long by 11 days, which were dropped by the Gregorian calendar in that year. This change was accepted at once by all Roman Catholic countries, but it was not until 1752 that England and her American colonies followed suit and until 1917 that Russia did so.
- Jan. 2, 1937: **Anglo-Italian accord was signed;** recognized freedom of communication in Mediterranean as a "vital interest" of both countries and pledged maintenance of Mediterranean status quo.
- Jan. 2, 1937: **Former U. S. Sec'y. of the Treasury Andrew W. Mellon** offered his \$19,000,000 art collection to the U. S. as a nucleus for a National Gallery of Art in Washington, to be constructed and endowed by him.
- Jan. 3, 1937: **German Gov't. promised to cease retaliatory acts** against Spanish Gov't.'s shipping as soon as demand for release of "Palos" cargo and passengers was met.
- Jan. 3, 1937: **Representatives of United Automobile Workers of America** empowered board of strategy to call strike in 69 General Motors plants in 14 States if company refused to negotiate with union; "sit-down" strikers continued to hold two Flint, Mich., Fisher Body plants in defiance of injunction.
- Jan. 4, 1937: **Nanking Gov't. unconditionally pardoned Gen. Chang Hsueh-liang,** previously sentenced to 10 years' imprisonment for kidnapping Gen. Chiang Kai-shek in Dec.
- Jan. 4, 1937: **U. S. Supreme Court unanimously overruled conviction** of Dirk de Jonge, a Communist, under the Oregon Criminal Syndicalism Law, on ground that his sentence abridged constitutional rights of freedom of speech and of assembly.
- Jan. 4, 1937: **Alfred P. Sloan, president of General Motors Corporation,** declared that the company would refuse to recognize any union as the only bargaining representative of labour.
- Jan. 5, 1937: **The 75th U. S. Congress convened;** Rep. William B. Bankhead Speaker of the House.
- Jan. 5, 1937: **A per capita debt of \$266.96 on Dec. 31, 1936,** was announced by the U. S. Treasury, in comparison with \$238.77 on Dec. 31, 1935, and \$12.36 on Mar. 17, 1917.
- Jan. 6, 1937: **Pres. Roosevelt, in message to Congress** on the "state of the Union," declared the Constitution adequate to meet modern needs without amendment but called upon courts for a more "enlightened" attitude in interpreting it. U. S. House and Senate passed Pittman-McReynolds resolution banning export of arms to Spanish Loyalists or Rebels. Embargo effective Jan. 8.
- Jan. 7, 1937: **Dr. Glenn Frank displaced as President** of the University of Wisconsin by an 8-7 vote of the Board of Regents.
- Jan. 7, 1937: **The Flint Alliance formed** by workers unsympathetic to the United Automobile Workers Union.
- Jan. 7, 1937: **Germany and Italy rejected Franco-British proposal** for immediate ban on foreign "volunteers" in Spanish armies; expressed willingness to support measure if all powers represented upon London Non-Intervention Committee agreed to it.
- Jan. 8, 1937: **Pres. Roosevelt, in his annual budget message to Congress,** forecast a conditionally balanced budget in the fiscal year 1938 and a completely balanced budget and a halting of the rise of the national debt at \$35,000,000,000 the following fiscal year.
- Jan. 8, 1937: **French Gov't. warned Spanish Rebels** that landing of German troops in Morocco violated Franco-Spanish pact of 1912; Germany denied Moroccan activity.
- Jan. 8, 1937: **Pres. Roosevelt authorized construction** of two 35,000-ton battleships following Japan's refusal to renew naval limitation treaties, which expired Dec. 31, 1936.
- Jan. 9, 1937: **Reich Gov't. announced conclusion** of German-Portuguese treaty, effective Dec. 18, 1936, under which Portugal agreed to restore German properties seized during World War.
- Jan. 10, 1937: **British Gov't. forbade enlistment** of its citizens in either Loyalist or Rebel Spanish armies and called upon other powers to take similar action.
- Jan. 11, 1937: **Chancellor Hitler and French Ambassador** to the Reich exchanged formal assurances that neither Germany nor France would disturb the status quo in Spain and Spanish Morocco.
- Jan. 11, 1937: **Battle between police and "sit-down" strikers** at Fisher Body plant in Flint, Mich., resulted in injuries to 28 persons.
- Jan. 11, 1937: **James M. Landis was appointed dean** of the Harvard Law school and resigned as chairman of the Securities and Exchange Commission, effective in summer of 1937.
- Jan. 12, 1937: **Pres. Roosevelt presented to Congress** his program for administrative reorganization; it called for two additional cabinet departments and for six executive assistants to the President, with all non-policy-determining offices placed under civil service.
- Jan. 12, 1937: **Foreign Sec'y. Anthony Eden in London address** declared Britain would, if driven, push rearmament program as hard as any nation, but that British preferred butter to guns and would strive unceasingly for world peace.
- Jan. 12, 1937: **The late Charles Hayden's will** provided \$50,000,000 for the establishment of a foundation to educate and assist boys and young men.
- Jan. 13, 1937: **U. S. State Dep't. warned Americans** serving as volunteers with either Spanish army that they faced fines and imprisonment and possible loss of citizenship.
- Jan. 14, 1937: **Col. Gen. Hermann Göring and Premier Mussolini** in Rome conference agreed that, pending effective non-intervention by all powers in Spanish war, Germany and Italy would rush support to Rebel forces.
- Jan. 14, 1937: **Canadian Parliament opened** with speech from the throne announcing conclusion of new five-year trade agreement between Britain and Canada.
- Jan. 15, 1937: **Gov. Frank Murphy of Mich.** arranged truce between General Motors Corp. and United Automobile Workers Union; "sit-down" strikers agreed to evacuate the plants during subsequent negotiations.
- Jan. 15, 1937: **French Chamber of Deputies unanimously** empowered Premier Blum's gov't. to bar French volunteers from Spanish armies when other powers agreed to similar measures.
- Jan. 16, 1937: **Non-striking automobile workers in Flint, Mich.,** requested conference with representatives of General Motors to discuss collective bargaining issue, as "sit-down" strikers began evacuation of occupied plants.
- Jan. 16, 1937: **Dr. Arthur E. Morgan,** chairman of the Tennessee Valley Authority, urged gov't. "co-operation" with utilities rather than a "finish fight." Senator Norris asked for legislation limiting the injunction power of courts because of their numerous anti-TVA writs.
- Jan. 17, 1937: **General Motors called off strike conference** to be held Jan. 18 when "sit-down" strikers refused to evacuate plants on ground that employers had violated terms of truce by agreeing to bargain with Flint Alliance; Gov. Murphy appealed to Sec'y. of Labor Perkins for mediation aid.
- Jan. 18, 1937: **Pres. Roosevelt appointed a committee** headed by Sec'y. of Interior Ickes to prepare legislation establishing a national policy on electric power.
- Jan. 19, 1937: **Howard Hughes established a world distance speed record** for land planes by averaging 332 miles an hour in 2,490-mile flight from Los Angeles to Newark, chiefly at an altitude of 14,000 feet, in 7 hours, 28 minutes and 25 seconds.
- Jan. 19, 1937: **Foreign Sec'y. Anthony Eden solemnly warned Germany** in Commons speech that she could decide Europe's future; promised British aid to Reich if Germany abandoned idea of national exclusiveness and co-operated fully with other powers in efforts to secure peace.

Jan. 20, 1937: **Franklin D. Roosevelt took the oath as President** of the U. S. for the second time in the first American inaugural to occur on any date save March 4. Reiterating his faith in adequacy of the Constitution without amendment to accomplish his program, he dedicated his second administration to securing a sufficiency for "those who have too little."

Jan. 20, 1937: **Conference between Sec'y. of Labor Perkins**, Gov. Murphy, and General Motor officials failed to break deadlock in automobile strike.

Jan. 21, 1937: **Foreign Minister Hachiro Arita**, speaking before Japanese Diet, urged colony-owning nations to adopt free trade policy toward nations lacking raw materials as an aid to world peace.

Jan. 21, 1937: **Automobile strike negotiations in Washington** temporarily ended when Alfred P. Sloan, president of General Motors, refused to continue discussion unless strikers evacuated plants.

Jan. 22, 1937: **Pres. Roosevelt, in reply to John L. Lewis's demand** that he support the automobile strikers "in every legal way," replied that "there come moments when statements, conversation and headlines are not in order."

Jan. 22, 1937: **Roswell Magill, Professor of Law at Columbia University**, was nominated by Pres. Roosevelt as Under-Secretary of the Treasury.

Jan. 23, 1937: **17 leading Russian Communists**, including Karl Radek, prominent journalist, and Gregory Piatakoff, former Assistant Commissar for Heavy Industry, were placed on trial in Moscow for participating in plot allegedly instigated by Lev Trotsky; they confessed plan to overthrow Soviet régime and assassinate its leaders.

Jan. 23, 1937: **Hirota Cabinet resigned in Japan** under pressure of Army leaders bent on establishing Fascist régime; on Feb. 2 Gen. Senjuro Hayashi, Army moderate, formed new ministry.

Jan. 24, 1937: **Premier Léon Blum, in speech at Lyons**, expressed France's willingness to help Germany solve her economic problems if assured that Reich would co-operate in securing world peace.

Jan. 24, 1937: **Bulgaria and Yugoslavia** signed treaty of friendship, ending long rivalry.

Jan. 25, 1937: **Atlantic and Gulf Coast maritime strike** ended after 11 weeks' unsuccessful effort to secure union recognition.

Jan. 26, 1937: **President Roosevelt termed Alfred P. Sloan's refusal** to take part in Washington strike negotiations until strikers evacuated plants as a "very unfortunate decision;" the following day Sec'y. of Labor Perkins requested Congress for a grant of power to subpoena records and witnesses in settling industrial disputes.

Jan. 27, 1937: **Seed Loan Bill, providing for loans** by Farm Credit Administration not to exceed \$400, passed by U. S. Senate without dissenting vote after debate on constitutionality.

Jan. 27, 1937: **League of Nations Council**

settled dispute between France, Syria, and Turkey over Alexandretta.

Jan. 28, 1937: **U. S. House of Representatives** passed Ramspeck Bill placing all postmasters under civil service rules.

Jan. 28, 1937: **Canada's "New Deal" legislation** on wages and hours, unemployment insurance, and marketing regulation, passed in 1934 and 1935 by the Bennett Gov't., was declared unconstitutional by the Privy Council's Judicial Committee in London, empire court of last resort.

Jan. 29, 1937: **Pres. Roosevelt indicated that he favoured** granting to Labor Dep't.'s conciliation service subpoena power in preliminary stages of labour disputes. A. F. of L. Pres. William Green opposed the granting of such power.

Jan. 29, 1937: **12 U. S. Navy planes completed hop** from San Diego to Honolulu in 21 hours and 43 minutes, the greatest non-stop ocean mass flight ever undertaken.

Jan. 30, 1937: **Chancellor Hitler, in Reichstag speech** commemorating National Socialism's fourth anniversary, repudiated "war guilt" clause of Versailles Treaty, demanded return of former German colonies, and declared that Reich was replacing "era of surprises" by one of international co-operation.

Jan. 30, 1937: **13 alleged Trotskyists on trial for treason** against the Soviet Gov't. were sentenced to death and executed on Feb. 1; 4 others, including Karl Radek and Gregory Sokolnikoff, former Ambassador to Great Britain, were given prison terms ranging up to 10 years.

Jan. 31, 1937: **Record floods in the Ohio Valley** began to recede after causing more than 400 deaths and property damage placed at \$550,000,000; approximately 671,000 persons were rendered homeless.

Feb. 1, 1937: **A National Guard regiment patrolled the area** surrounding Fisher Body and Chevrolet plants in Flint, Mich., after rioting resulted in minor injuries to some 20 persons; Gov. Murphy refused to invoke martial law.

Feb. 1, 1937: **Poland completed plans for fortification** of her German frontier with French aid.

Feb. 2, 1937: **French Chamber of Deputies, 405 to 186**, approved the Blum Gov't.'s defence program, doubling the 19,000,000,000 franc appropriation already voted for the current year, to match reported German 1936-37 defence expenditure of 12,600,000,000 marks.

Feb. 2, 1937: **Judge Paul V. Gadola of the Federal Circuit Court**, in sweeping injunction, ordered evacuation by "sit-down" strikers of two Fisher Body plants in Flint, Mich.; the order was defied by the men and never executed. John L. Lewis moved his headquarters from Washington to Detroit to assume active leadership of strike.

Feb. 3, 1937: **The 33rd International Eucharistic Congress** of the Roman Catholic Church opened in Manila.

Feb. 3, 1937: **Pres. Roosevelt submitted to Congress a report** of the National

Resources Committee, accompanied by recommendation for the adoption of a 6-year \$5,000,000,000 public works program, including flood-control projects.

Feb. 4, 1937: **40,000 seamen returned to work** at conclusion of the 98-day \$686,000,000 Pacific Coast strike, the most costly in U. S. maritime history; the men tentatively gained higher wages, union control of hiring agencies, better working conditions, and an 8-hour day.

Feb. 4, 1937: **Pres. Roosevelt informed disputants** in automobile strike, through Gov. Murphy, that he insisted upon a settlement. His intervention resulted in resumption of negotiations the following day.

Feb. 5, 1937: **Pres. Roosevelt startled the U. S.** by sending to Congress an unheralded message and bill seeking comprehensive reforms designed to "vitalize the courts." He asked for power to appoint a maximum of 6 additional Supreme Court Justices—one for each incumbent over 70 years of age who fails to retire—and up to 50 lower court justices.

Feb. 5, 1937: **Soviet Gov't. approved proposed international ban** on arms and volunteers for Spain, provided it participated in naval patrol to enforce measure.

Feb. 7, 1937: **William Green, president of the American Federation of Labor**, declared that 8,917,000 persons were unemployed in December, 1936, despite an increase in the number of employed persons in that month.

Feb. 7, 1937: **The Social Security Board** announced that over 22,000,000 applications for benefits were on file and that some 18,000,000 workers were covered by unemployment insurance laws of 35 States and the District of Columbia.

Feb. 8, 1937: **Malaga, Spain**, fell to Gen. Francisco Franco's Rebel forces.

Feb. 8, 1937: **Mayor Harold Bradshaw of Flint, Mich.**, was given dictatorial powers, following the City Commission's declaration that a state of emergency existed.

Feb. 8, 1937: **Sec'y. of Agriculture Wallace**, with Pres. Roosevelt's approval, advocated restoration in different form of the administration's original farm program, despite Supreme Court's adverse ruling.

Feb. 8, 1937: **Nanking Gov't. troops seized Sian**, capital of Shensi Province, without resistance, practically terminating the December rebellion.

Feb. 9, 1937: **Lev Trotsky offered to submit to arrest** by Soviet Gov't. if found guilty by impartial tribunal of alleged crimes.

Feb. 10, 1937: **Pres. Roosevelt, submitting to Congress** the report of his Great Plains Committee, advocated long-range program to fight drought in 10 States.

Feb. 11, 1937: **The 44-day automobile strike ended**, with General Motors Corporation announcing a \$25,000,000 wage increase. Terms of the agreement included: recognition of the United Automobile Workers as bargaining agent for its membership, no discrimination against

union members by company, union agreement to call off strike and evacuate plants and start of bargaining concerning working conditions.

Feb. 11, 1937: *Chancellor of Exchequer Neville Chamberlain* announced in British House of Commons gov't.'s decision to spend £400,000,000 for rearmament during next 5 years.

Feb. 12, 1937: *The German Reichsbank* was placed under Chancellor Hitler's direct control and the railways under that of the Transportation Minister, allegedly to end "foreign influences."

Feb. 13, 1937: *Charles Seymour, provost and professor of history*, was elected president of Yale, succeeding Dr. James Rowland Angell.

Feb. 13, 1937: *Martial law was declared in Anderson, Ind.*, by Gov. Townsend, after strike clash in which 10 persons were injured. John L. Lewis announced that unionization of the steel industry would be the next objective of the Committee for Industrial Organization.

Feb. 14, 1937: *135,000 members of the Amalgamated Clothing Workers* of America received a 12% rise in wages, amounting to \$30,000,000 annually, in a 3-year contract with clothing manufacturers.

Feb. 15, 1937: *Premier Senjuro Hayashi*, addressing first session of Diet since fall of Hirota Cabinet, announced a policy of non-aggression and invited China and the Soviet Union to establish more cordial relations with Japan.

Feb. 15, 1937: *Chancellor Hitler authorized a free election* of new General Synod of the German Evangelical Church, recognizing failure of efforts to co-ordinate German Protestantism with the Nazi régime.

Feb. 16, 1937: *London Non-Intervention Committee* agreed to prohibition against additional foreign volunteers in Spanish war, effective February 20 at midnight; naval patrols and frontier supervision were to enforce ban on entry into Spain of arms and volunteers, effective midnight on March 6.

Feb. 16, 1937: *Pres. Roosevelt submitted to Congress* the report of his Special Committee on Farm Tenancy, advocating a long-range Federal-State program to assist tenants toward ultimate ownership.

Feb. 16, 1937: *British Gov't. announced that in April* it would commence the most extensive and costly naval construction program ever launched in peace time.

Feb. 17, 1937: *Paul V. McNutt, former Gov. of Ind.*, named by Pres. Roosevelt as High Commissioner to the Philippines, succeeding Frank Murphy, present Gov. of Mich.

Feb. 18, 1937: *Pres. Roosevelt recommended to Congress* legislation to insure the 1938 wheat crop as the first step toward general crop insurance and storage of reserves.

Feb. 18, 1937: *Prime Minister Stanley Baldwin*, in House of Commons, stated Britain's intention to work for new regional

security pact in Western Europe to replace Locarno Treaty.

Feb. 19, 1937: *Kuomintang party convention* decided to terminate 10-year war on Chinese Communists in return for latter's agreement to submit to Nanking Gov't.'s supervision.

Feb. 19, 1937: *Marshal Rodolfo Graziani, Viceroy of Ethiopia*, and 2 other officials wounded by hand grenades thrown by Ethiopians in Addis Ababa. An army of 3,000 Ethiopians planning to attack the capital at the same time was reported virtually destroyed.

Feb. 21, 1937: *Col. Adam Koc announced formation* of a new Polish party with semi-Fascist program.

Feb. 22, 1937: *Arrival of German Foreign Minister in Vienna* marked by riots in which 28 Nazis were injured and 200 jailed.

Feb. 23, 1937: *Italian official sources estimated* that over 100 armed Ethiopian suspects in Addis Ababa bombing outrage had been executed.

Feb. 24, 1937: *Dr. Francis E. Townsend*, founder and leader of the Townsend Recovery Plan movement, convicted by a District of Columbia jury of contempt of U. S. House of Representatives for refusal in 1936 to testify before Congressional investigating committee.

Feb. 25, 1937: *Ras Desta Deltu, son-in-law of Emperor Haile Selassie of Ethiopia*, was captured and put to death by native troops under Italian command.

Feb. 25, 1937: *U. S. Senate, by 58-24 vote*, passed joint resolution, already approved by House, extending to June 12, 1940, President's power to negotiate trade pacts with foreign gov'ts.

Feb. 26, 1937: *Russia retired from international naval patrol* of Spanish coast after participating powers conceded her right to take part.

Feb. 26, 1937: *Premier Léon Blum won a 362-211 vote* of confidence in French Chamber of Deputies after an attack on his financial policy.

Feb. 27, 1937: *Pres. Roosevelt submitted to 48 State Governors* model law under which farmers' obedience to soil erosion control by local agencies would be made compulsory.

Mar. 1, 1937: *U. S. Supreme Court, in 5-4 decision*, upheld 1933 Congressional abrogation of gold payments as applied to rental contracts calling for payment in gold bullion.

Mar. 1, 1937: *The Carnegie-Illinois Steel Corp.*, world's largest producer of steel, began conference with Committee for Industrial Organization's Steel Workers Organizing Committee; independent steel companies simultaneously announced wage increases and hours reductions affecting some 150,000 workers.

Mar. 2, 1937: *General steel strike was averted* by agreement between the Carnegie-Illinois Steel Corp., and C. I. O. union, providing for union recognition, wage increase, and 40-hour week.

Mar. 3, 1937: *U. S. Senate, by a 63-6 vote*, adopted the Pittman resolution providing for strict neutrality and a minimum of discretion for the President in the event of foreign war.

Mar. 4, 1937: *Pres. Roosevelt, speaking at Washington* Democratic "victory dinner," tacitly demanded party's support for his Court plan; declared its continuation as majority party depended upon courage immediately to "lead the American people where they want to go."

Mar. 4, 1937: *British Labourites, under leadership of Herbert Morrison*, increased majority in London County Council elections for the ensuing 3 years from 14 to 26 seats.

Mar. 5, 1937: *Sec'y. of State Hull expressed U. S. regret* in reply to Reich Gov't.'s official protest at New York Mayor La Guardia's reference to Hitler as "brown-shirted fanatic." On Mar. 12 U. S. Gov't. officially protested subsequent German press attacks upon Mayor La Guardia, the U. S. Gov't. and American women.

Mar. 5, 1937: *"Big navy" advocates in U. S. House of Representatives* won signal victory when \$526,555,000 Naval Supply Bill was passed after defeat of efforts to cut appropriation.

Mar. 5, 1937: *French Gov't. terminated ban on gold* and promised balanced budget in effort to secure return to France of gold that had been sent abroad.

Mar. 5, 1937: *Russian Communist Party*, in accordance with new Constitution, decreed democratic secret ballot for lower party officials.

Mar. 6, 1937: *Firestone Tire and Rubber Co.* closed Akron (Ohio) plants after receiving demand for recognition of United Rubber Workers of America as sole collective bargaining agent for its 10,000 workers.

Mar. 6, 1937: *Australian referendum rejected* two constitutional amendments extending Federal powers over marketing and aviation.

Mar. 7, 1937: *Francisco Largo Caballero, Loyalist Premier of Spain*, emerged from cabinet crisis with united support of all Leftist political factions.

Mar. 8, 1937: *New wave of sit-down strikes* closed all major Detroit plants of Chrysler and Hudson automobile companies, affecting 60,000 workers. A. F. of L. announced drive to organize steel industry in opposition to C. I. O.

Mar. 8, 1937: *Naotake Sato, new Japanese Foreign Minister*, forecast moderation of Japan's policy in China in his first speech to House of Peers.

Mar. 8, 1937: *The "Mar Cantabrico" laden with aeroplanes and munitions* for Spanish Loyalists, was captured by Rebel cruiser in Bay of Biscay.

Mar. 9, 1937: *Pres. Roosevelt, in nationwide radio address*, declared his judiciary reform plan was designed to protect nation against usurpation of legislative functions by Supreme Court.

Mar. 9, 1937: *New York State Assembly rejected Child Labour Amendment*, 102 to

42, following attack on measure by Cardinal Hayes and Roman Catholic bishops of State.

Mar. 11, 1937: *Pres. Roosevelt left Washington* for 10-day vacation at Warm Springs, Ga.

Mar. 11, 1937: *Sir Samuel Hoare, British Admiralty chief*, told House of Commons Britain would defend all her possessions and trade routes but that naval rivalry with the U. S. was a thing of the past.

Mar. 12, 1937: *General Motors and United Automobile Workers of America* concluded final agreement for improved working conditions, and for settlement of future grievances without recourse to the sit-down strike.

Mar. 12, 1937: *U. S. Gov't. bonds declined sharply* in heaviest trading on N. Y. Stock Exchange in 16 years.

Mar. 12, 1937: *Mussolini, in inspection tour of Libya*, opened 1,250-mile highway to Egyptian border.

Mar. 13, 1937: *Offensive against Madrid by Italian troops* in Spanish Rebel service met crushing defeat at Brihuega, near Guadalajara.

Mar. 13, 1937: *French Gov't. expropriated Creusot works* of the Schneider armaments firm, the largest in France.

Mar. 15, 1937: *Circuit Court Judge Allan Campbell* of Detroit issued mandatory injunction for evacuation of Chrysler plants by sit-down strikers by Mar. 17.

Mar. 15, 1937: *Higher income and profits taxes* to balance budget and reduce public debt were urged by Marriner S. Eccles, chairman of Federal Reserve Board, to prevent monetary inflation.

Mar. 17, 1937: *6,000 sit-down strikers defied court injunction* ordering evacuation of eight Chrysler plants in Detroit; Gov. Murphy warned that State might have to use force to restore respect for courts and public authorities. Taxi strike in Chicago culminated in violent rioting in the Loop district. Five units of U. S. Steel Corp. contracted with C. I. O. unions for year of industrial peace.

Mar. 17, 1937: *Sec'y. of State Hull urged cessation* of "bitter and vituperative utterances in this country and Germany," following another Nazi protest against verbal attacks on Hitler by Mayor La Guardia of New York.

Mar. 18, 1937: *Gas explosion shattered the New London, Texas, high school building*, killing most of the 40 teachers and 700 children inside.

Mar. 18, 1937: *U. S. House adopted the McReynolds resolution*, giving the President discretionary powers to preserve American neutrality as opposed to mandatory provisions of Senate neutrality bill.

Mar. 18, 1937: *Pope Pius issued anti-Communist encyclical*, urging states "to prevent within their territories the ravages of the anti-God campaign."

Mar. 18, 1937: *Clarence A. Dykstra, City Manager of Cincinnati*, was elected Pres. of Univ. of Wisconsin, succeeding Dr. Glenn Frank.

Mar. 18, 1937: *Pres. Quezon of Philippine Commonwealth* in conference with Washington officials asked complete independence for Philippines in 1938 or 1939 instead of on scheduled date in 1946.

Mar. 19, 1937: *Court order for arrest of 6,000 sit-down strikers* occupying Chrysler plants in Detroit in defiance of injunction was disregarded by sheriff, who said his force of deputies was insufficient. Sit-down strikers were assailed and defended in Congress.

Mar. 20, 1937: *Pres. Homer Martin of United Automobile Workers of America* defied Gov. Murphy to use National Guard to oust sit-down strikers in Chrysler plants; general strike in Detroit was threatened. Wave of sit-down strikes was sweeping Michigan, Indiana and Illinois.

Mar. 20, 1937: *Italian troops with Spanish Rebels* were reported as flying in panic before Loyalist drive in Guadalajara sector, leaving behind many prisoners and huge stores of munitions.

Mar. 20, 1937: *Amelia Earhart's round-the-world flight* was prematurely ended when plane was damaged during attempted take-off from Honolulu airport.

Mar. 21, 1937: *Pope Pius in encyclical read from Berlin pulpits* declared church would defeat all efforts to substitute modern ideologies for Christian faith; he attacked Nazis for alleged violations of concordat.

Mar. 21, 1937: *Clash between Nationalist demonstrators and police* in Ponce, Porto Rico, cost seven or more lives; over 50 were injured.

Mar. 22, 1937: *Chief Justice Hughes*, with assent of Justices Brandeis and Van Devanter, opposed Pres. Roosevelt's proposal to increase size of Supreme Court in letter read before Senate Judiciary Committee. Former Supreme Court Justice John Hessin Clarke, in nation-wide radio address, said the President's court reform plan was "clearly constitutional."

Mar. 22, 1937: *French liner "Normandie" set new eastward trans-Atlantic crossing* record of 4 days, 6 minutes, 23 seconds for 2,967 miles from Ambrose Light to Bishop's Rock, an average of 30.99 knots per hour.

Mar. 23, 1937: *Gov. Murphy of Mich.* called Walter P. Chrysler and John L. Lewis into joint conference on tie-up of Chrysler plants, as 50,000 Detroit workers held mass demonstration against police evictions of sit-down strikers in other factories.

Mar. 23, 1937: *Reich Gov't. appointed Dr. Hans Heinrich Dieckhoff*, Under-Sec'y. of German Foreign Office, as ambassador to U. S., succeeding Dr. Hans Luther.

Mar. 23, 1937: *With March income-tax payments* about \$150,000,000 below estimates, U. S. Treasury indicated that deficit in 1936-37 and 1937-38 budgets would be greater than anticipated.

Mar. 24, 1937: *French Foreign Minister warned Britain and Germany* that France would not stand for further direct Italian aid to Spanish rebels in violation of non-intervention agreement of Feb. 20.

## CALENDAR OF EVENTS

Mar. 24, 1937: *Sen. Borah introduced new Child Labour Amendment* to Constitution, applying only to children of 14 years or less.

Mar. 25, 1937: *Detroit sit-down strikers* evacuated Chrysler plants on order from John L. Lewis, C. I. O. chairman, after Walter P. Chrysler on Mar. 24 agreed not to resume production or move machinery during collective bargaining negotiations.

Mar. 25, 1937: *Seven labour leaders and lawyers* were found guilty in restaurant racket trial by New York city jury.

Mar. 25, 1937: *Italy and Yugoslavia ended their long hostility* with five-year pact guaranteeing their mutual frontiers and status quo in Adriatic.

Mar. 26, 1937: *Attacks upon Italy in British House of Commons* produced new wave of intense anti-British feeling among Italians, spurred on by gov't. press.

Mar. 26, 1937: *Crushing Rebel drive on Pozoblanco*, key to important mercury mines at Almaden, Loyalists launched offensive toward Cordoba and gained much ground in subsequent fighting.

Mar. 27, 1937: *Governors of Ala., Ga., La., and S. C.* broadcast joint endorsement of President's court reform plan.

Mar. 27, 1937: *WPA report declared national production* 20 per cent higher than in 1929 would be required to reduce U. S. unemployment to 1929 level.

Mar. 28, 1937: *William Green, pres. of A. F. of L.*, declared sit-down strike was illegal and its use "detrimental to labour's interests." On Mar. 29 John L. Lewis termed Green's statement "characteristically cowardly and contemptible."

Mar. 28, 1937: *Pope Pius, making first public appearance* since he became ill in Dec., was cheered by 250,000 people in St. Peter's cathedral and square.

Mar. 29, 1937: *U. S. Supreme Court, by 5 to 4 decision*, upheld Washington State minimum wage law, reversing its decision of previous June on similar New York State law. Court also upheld unanimously Frazier-Lemke Farm Mortgage Moratorium Law and sections of Railway Labor Act requiring railroads to bargain collectively with their employees.

Mar. 30, 1937: *Pan American Clipper*, surveying 7,000-mile commercial air route between U. S. and Australasia, arrived at Auckland, New Zealand; stops were made en route at Hawaii, Kingman Reef, and American Samoa.

Mar. 30, 1937: *Lord Tweedsmuir, Gov.-Gen. of Canada*, arrived in Washington with Lady Tweedsmuir for two-day visit at White House. On Apr. 1 he addressed U. S. Senate and House.

Mar. 30, 1937: *Soviet Gov't., alarmed by industrial production slump*, ordered 20 per cent increase in output over preceding year.

Mar. 31, 1937: *Japanese Diet was dissolved* and new elections ordered.

Mar. 31, 1937: *Rejecting Pres. Roosevelt's personal appeal*, House Agriculture Com-

mittee emasculated bill to finance purchase of land by farm tenants.

Apr. 1, 1937: *New Constitution for India* went into effect with inauguration of provincial autonomy, despite non-cooperation of Indian Nationalists.

Apr. 1, 1937: *General Motors Chevrolet plant* in Flint was closed by walkout, raising total of idle automobile workers in Mich. to 120,000. Move in U. S. Senate to condemn sit-down strikes provoked sharp debate.

Apr. 2, 1937: *Two-year agreement* between United Mine Workers and operators for wage increase of \$85,000,000 a year to 300,000 miners ended one-day stoppage of coal mining in Appalachian area.

Apr. 2, 1937: *Basque Nationalists were driven back* by Rebel drive on Bilbao; Loyalists gained on Madrid and Cordoba fronts; Cordoba was bombed with fleet of new Russian planes.

Apr. 2, 1937: *Pres. Roosevelt announced gov't.* would curtail purchases of durable goods to curb high price trend in steel, copper and other basic products.

Apr. 3, 1937: *Major Gen. Edward M. Markham*, Chief of Army Engineers, formally recommended completion of \$197,921,000 Florida ship canal.

Apr. 3, 1937: *Henry G. Yagoda*, former acting chief of Ogpu, dismissed as Soviet Commissar of Communications for "criminal activities."

Apr. 4, 1937: *U. S. Federal Reserve Board announced it would buy Federal securities* on open market for account of Reserve Banks to protect gov't. bond market and extend easy-money policy.

Apr. 5, 1937: *U. S. Senate passed Guffey-Vinson Coal Bill*, after rejecting, 48 to 36, an amendment declaring sit-down strikes "illegal and contrary to public policy."

Apr. 5, 1937: *Sec'y. of State Hull in New York speech* said world armament race could lead only to military explosion or economic collapse; urged concerted effort for Wilsonian type of economic peace.

Apr. 6, 1937: *Chrysler automobile strike settled* by Walter P. Chrysler and John L. Lewis after 30-day tie-up, estimated to have cost \$87,000,000. New sit-downs closed three General Motors plants. Vermont legislature outlawed sit-down strikes.

Apr. 7, 1937: *Mob of Central Pennsylvania farmers* ejected several hundred sit-down strikers from Hershey chocolate plant at Hershey, Pa. U. S. Senate passed, 75 to 3, resolution condemning sit-down strikes as illegal and declaring industrial spy system, denial of collective bargaining and other unfair labour practices "contrary to sound public policy."

Apr. 8, 1937: *U. S. House, 236 to 149*, defeated proposed inquiry into sit-down strikes. Premier Hepburn of Ontario declared war on Committee for Industrial Organization, after strike of affiliated automobile workers tied up General Motors plant at Oshawa, Canada.

Apr. 10, 1937: *Premier Hepburn of Ontario* refused to deal with Hugh Thompson

of Detroit, United Automobile Workers' representative, "or any other paid, foreign C. I. O. agitator" and negotiations for settlement of strike in General Motors Oshawa plant collapsed.

Apr. 10, 1937: *Italian Gov't. extended partial self-rule* to Muslims of Libya; appropriated 85,000,000 lire for naval base at Assab, dominating southern entrance to Red sea.

Apr. 10, 1937: *Prime Minister Stanley Baldwin*, announcing his impending retirement, warned Britain against fascism and communism.

Apr. 11, 1937: *Premier Van Zeeland of Belgium* won striking victory over Rexists (Fascists) in Brussels election, following denunciation of Rexist movement by Cardinal Van Roey, Roman Catholic Primate.

Apr. 11, 1937: *London Cabinet, modifying Britain's traditional maritime policy*, ordered British merchant vessels bound for Bilbao, Spain, with food not to run Spanish Rebels' blockade.

Apr. 11, 1937: *Clash of rival miners' unions* led to shooting of 11 persons in Galena, Kan.

Apr. 12, 1937: *U. S. Supreme Court*, in four momentous 5 to 4 decisions upholding National Labor Relations (Wagner) Act, ruled that Congress had power to regulate industries organized on national scale even if their products were locally manufactured; labour's right to organize in unions and bargain collectively with large industries was affirmed.

Apr. 12, 1937: *Foreign Sec'y. Anthony Eden* defended Britain's policy of non-intervention and non-involvement in Spanish civil war; predicted conflict would end in stalemate and "peace without victory."

Apr. 13, 1937: *Pres. Roosevelt ordered re-survey* of Federal expenditure requirements in view of adverse budget trend.

Apr. 14, 1937: *Premier Hepburn of Ontario* forced resignation of two members of his Cabinet for opposing his fight against C. I. O. in General Motors Oshawa plant strike. On Apr. 15 United Automobile Workers of America agreed to settlement of Oshawa strike on "Canadian" basis.

Apr. 14, 1937: *British House of Commons rejected Labour motion* censuring gov't.'s Spanish policy.

Apr. 14, 1937: *Chrysler Corp. and United Automobile Workers of America* signed supplementary pact on handling collective bargaining, grievances, and seniority issues.

Apr. 15, 1937: *U. S. House passed Gavagan Anti-Lynching Bill*, 277 to 118, over protests of Southern members.

Apr. 15, 1937: *Reversing previous position*, Italy expressed willingness to discuss withdrawal of all foreigners fighting on both sides in Spain's civil war.

Apr. 16, 1937: *Premier Paul Van Zeeland of Belgium* announced that he would visit Pres. Roosevelt at Washington in

June in furtherance of move to reduce world trade barriers.

Apr. 16, 1937: *U. S. Circuit Court of Appeals at Boston* declared unconstitutional the unemployment insurance and old-age assistance provisions of Social Security Act.

Apr. 18, 1937: *French Socialist party convention* at Puteaux upheld Premier Blum; voted dissolution of radical faction demanding intervention on side of Spanish Loyalists.

Apr. 18, 1937: *Furthering Chinese unity against Japan*, the formerly dissident Kwangsi war lords joined with Nanking leaders in forming new national defence council.

Apr. 19, 1937: *German Gov't. expressed willingness* to attend international conference on economic co-operation and armament limitation.

Apr. 19, 1937: *International patrol of Spanish coasts* to bar foreign war supplies and "volunteers" went into effect at midnight.

Apr. 20, 1937: *Pres. Roosevelt in message to Congress* estimated deficit for fiscal year 1937 at \$2,557,000,000; asked \$1,500,000,000 appropriation for relief and work-relief in 1938 fiscal year.

Apr. 20, 1937: *British Chancellor of the Exchequer* announced rise in basic income tax rate to 25 per cent and growth-of-profits tax of 33½ per cent to help finance Britain's rearmament.

Apr. 21, 1937: *Maine National Guard was called out* to curb violence in 28-day C. I. O. shoe strike in Lewiston-Auburn area.

Apr. 21, 1937: *Ten-day Rebel bombardment of Madrid* had killed 200 civilians.

Apr. 22, 1937: *Agreement ending strike in General Motors plant* at Oshawa, Ontario, was signed in Premier Hepburn's office.

Apr. 22, 1937: *Premier Mussolini refused Italian support* for restoration of Habsburgs in Austria in conference with Chancellor Schuschnigg at Venice.

Apr. 23, 1937: *Riot of cannery strikers in Stockton, Calif.*, caused injuries to 50 persons. Sit-down strike of 1,200 workers closed Ford Motor Co. plant at Richmond, Calif.

Apr. 23, 1937: *Three British food ships ran Rebel blockade* of Bilbao, Spain; they were protected when outside territorial waters by battle cruiser "Hood."

Apr. 23, 1937: *U. S. Gov't. filed suit in New York* for dissolution as a trust of \$174,000,000 Aluminum Co. of America, controlled by former Sec'y. of Treasury Andrew W. Mellon and associates.

Apr. 24, 1937: *Independent Automobile Employees Ass'n.* was formed at Flint, Mich., to combat C. I. O. activities and establish separate collective bargaining agency.

Apr. 24, 1937: *Assembly of 33 civilians* took over the civil gov't. of Madrid on orders from Premier Largo Caballero.

- Apr. 24, 1937: *Joint Anglo-French note to Belgian Foreign Minister* freed Belgium of its obligations under Locarno Treaty, while continuing the Anglo-French guarantee of Belgian neutrality.
- Apr. 25, 1937: *Strongly fortified peaks guarding road* to Bilbao were captured by Spanish Rebels. On following day Durango, key to Basque capital, and Eibar were occupied and Guernica, ancient Basque capital, was destroyed by terrific 3½-hour aerial bombardment.
- Apr. 26, 1937: *Tie-up of railway operations* in New York city and vicinity averted through intervention of Pres. Roosevelt under Labor Railway Act; board to investigate dispute appointed.
- Apr. 26, 1937: *Premier T. D. Patullo of British Columbia* announced agreement with Dominion Gov't. for incorporation of Yukon Territory in Province.
- Apr. 26, 1937: *U. S. Supreme Court by 5 to 4 decision* nullified 17- to 20-year prison sentence passed by Georgia court on Angelo Herndon, Negro Communist, as violating guarantees of liberty in Fourteenth Amendment.
- Apr. 26, 1937: *Prime Minister Baldwin* announced that Britain would nationalize coal royalties, paying owners £66,450,000, as first step toward rehabilitation of coal-mining industry.
- Apr. 28, 1937: *French Gov't. proposed nationalization* of private railways and unification of all lines to end chronic operating deficits.
- Apr. 29, 1937: *Compromise neutrality bill* was rushed through both houses of Congress to replace temporary legislation due to expire at midnight of May 1; gave President discretionary powers.
- Apr. 29, 1937: *Basques retreated to last line* of Bilbao's defenses; 32 Loyalist planes arrived from Valencia to aid them.
- Apr. 29, 1937: *Nazi Gov't. launched new attack on Catholic Church*, announcing mass trials of more than 1,000 priests, monks and lay brothers on immorality charges.
- Apr. 30, 1937: *Rebel battleship "España" was sunk* by mine or Loyalist aerial bombs off Santander, Spain, while pursuing British merchant ship running Rebel blockade.
- Apr. 30, 1937: *Elections to Japanese Diet* showed heavy gains for labour and other anti-militarist parties.
- Apr. 30, 1937: *Pres. Eamon de Valera's draft* of new Constitution was published and plebiscite on it was called for in June.
- Apr. 30, 1937: *Agreement for termination of capitulations* in Egypt in 1939 reached at international conference at Montreux, Switzerland.
- May 1, 1937: *Chancellor Hitler defied anti-Nazi religious groups* and Pope in May Day speech to German labour; demanded exclusive Nazi control over youth.
- May 1, 1937: *Soviet military preparedness* demonstrated in Red Army's May Day parade in Moscow.
- May 2, 1937: *U. S. Labor Dept.* estimated 8,241,000 increase in employment since Mar., 1933, low point of depression.
- May 2, 1937: *Works Progress Administrator Hopkins* announced that State and local relief and work-relief expenditures were \$1,244,953,000 in 1936 against \$338,793,000 in 1933.
- May 3, 1937: *Pulitzer Prizes for 1937* were awarded to Margaret Mitchell for *Gone With the Wind* (novel); George S. Kaufman and Moss Hart for *You Can't Take It With You* (play); Van Wyck Brooks for *Flowering of New England* (history); Allan Nevins for *Hamilton Fish, the Inner History of the Grant Administration* (biography); Robert Frost for *A Further Range* (poetry).
- May 3, 1937: *A final divorce decree* was awarded Mrs. Wallis Warfield Simpson in London; the Duke of Windsor immediately left Austria and joined her May 4 at Château de Candé near Tours, France.
- May 4, 1937: *Anarchist revolt against Catalan Gov't.* broke out in Barcelona; it was crushed after considerable fighting.
- May 4, 1937: *Premier Mussolini and Foreign Minister von Neurath* of Germany, meeting in Rome, planned closer Italo-German collaboration and development of mid-European bloc of Fascist states.
- May 5, 1937: *Mexican Supreme Court* declared unconstitutional Chihuahua law permitting only one priest in entire State.
- May 5, 1937: *Prime Minister Baldwin* appealed for industrial peace in his last speech in House of Commons.
- May 6, 1937: *\$10,000,000 Mellon Institute of Industrial Research* dedicated by Andrew W. Mellon at Pittsburgh.
- May 6, 1937: *The Zeppelin "Hindenburg" crashed in flames* at Lakehurst, N. J., at completion of trans-Atlantic voyage, killing 36 and injuring 30 of the 97 passengers and crew members.
- May 8, 1937: *Mussolini recalled all Italian journalists in London* and barred all except three British newspapers from Italy.
- May 8, 1937: *Basque Gov't. mobilized* three additional army and navy classes as Rebel pressure against Bilbao increased.
- May 9, 1937: *Italy celebrated first anniversary* of proclamation of Italian Empire with great military review in Rome.
- May 10, 1937: *On eve of coronation*, George VI of Britain issued long honours list and dined 400 royal visitors, ambassadors and nobles at state banquet.
- May 11, 1937: *Prime Ministers of five Dominions* presented "loyal addresses" to George VI at Buckingham Palace ceremonies; the King pledged himself to carry on his father's work for the British empire; in Dublin Republican demonstrators clashed with the police.
- May 12, 1937: *George VI was crowned King and Emperor* in Westminster Abbey; rode in state through cheering throngs, and made a radio address to the people of the empire, promising to serve them faithfully.
- May 12, 1937: *Two plants of Jones & Laughlin Steel Corp.* were closed by C. I. O. strike in Pittsburgh.
- May 12, 1937: *Spanish Loyalists were reported repulsed* in heavy attack on Toledo.
- May 13, 1937: *Floating mine disabled British destroyer "Hunter"* off southern coast of Spain; three sailors were killed, four missing, and a score injured by explosion.
- May 14, 1937: *Pres. Roosevelt returned to Washington* from fishing trip in Gulf of Mexico; renewed drive for his court reorganization bill and for broad Federal action to raise social standards.
- May 14, 1937: *Federal Circuit Court of Appeals at Covington, Ky.,* dissolved temporary injunction against TVA power program granted to 19 private utilities on Dec. 14.
- May 14, 1937: *Imperial Conference* opened in London.
- May 14, 1937: *Henry T. Merrill and John S. Lambie, Jr.,* completed first commercial round-trip plane flight over North Atlantic, landing at New York city from Liverpool, England, with coronation pictures five days after take-off from New York.
- May 15, 1937: *Loyalist Cabinet at Valencia, Spain,* resigned; more moderate ministry formed May 17 by Dr. Juan Negrin, Socialist and former Finance Minister.
- May 15, 1937: *Silver Jubilee of Christian X of Denmark* celebrated at Copenhagen, with kings of Norway and Sweden in attendance.
- May 16, 1937: *Four high officials of Soviet Central Trade Union Council* arrested for malfeasance and "Trotskyism"; all except one member of Council's secretariat dismissed. On May 17 Kremlin decree established supreme military councils to control army commanders.
- May 17, 1937: *U. S. Supreme Court, 4 to 3,* upheld Louisiana tax on chain stores based on total number of stores in each chain system.
- May 17, 1937: *U. S. Commerce Dep't.* banned as unsafe New York-Paris air race organized by French Gov't. to commemorate tenth anniversary of Col. Chas. A. Lindbergh's flight.

Dec. 19, 1937: *Soviet Gov't. announced execution* for high treason of Leo. M. Karakhan, former Vice-Commissar of Foreign Affairs, and seven other important Soviet officials.

Dec. 19, 1937: *Completion of 1,800-mile* Soviet military railway paralleling Trans-Siberian Ry. from Lake Baikal to Khabarovsk near Pacific reported.

Dec. 20, 1937: *Sec'y. of State Hull announced* U. S. would keep its existing military and naval forces in China.

Dec. 20, 1937: *U. S. Supreme Court ruled*, 7 to 2, that information obtained by tapping telephone wires could not be used as evidence in criminal trials.

Dec. 21, 1937: *Unqualified support of Pres. Roosevelt* in diplomatic crisis with Japan over "Panay" bombing announced by Alfred M. Landon, Republican presidential candidate in 1936; Pres. Roosevelt

declared his opposition to policy of "peace at any price."

Dec. 21, 1937: *U. S. Senate passed Housing Bill*, 60 to 4. Special session of Congress adjourned without final action on any one of four major measures requested by Pres. Roosevelt.

Dec. 21, 1937: *A. F. of L.-C. I. O. peace negotiations* ended in failure.

Dec. 22, 1937: *Pres. Roosevelt warned Congress* that he would hold it responsible for appropriations in excess of budget estimates.

Dec. 23, 1937: *National Labor Relations Board* declared Ford Motor Co. guilty of violating National Labor Relations Act.

Dec. 24, 1937: *Japanese laid siege to Tsinan*, capital of Shantung Province; it capitulated Dec. 27, leaving Japan in control of seven provincial capitals in addition to Nanking. Chinese razed Japanese cotton mills and other valuable properties in Tsingtao in advance of Japanese occupation.

Dec. 24, 1937: *Pope Pius told Sacred College of Cardinals* Catholic Church in Germany was victim of "terrible persecution."

Dec. 24, 1937: *Japan in formal reply to U. S.* protest on "Panay" bombing declared the attack unintentional, but apologized and promised compensation and guarantees against repetition. On Dec. 25 Sec'y. of State Hull accepted Japanese note as satisfactory, conditional upon future observance of U. S. treaty rights.

Dec. 26, 1937: *Ass't. Attorney-General Robert H. Jackson* fired opening gun of Administration campaign against business monopolies in Washington radio address;

attributed business recession to high monopoly prices.

Dec. 26, 1937: *British completed plans* for broadcasts in Arabic, Spanish and Portuguese to counteract anti-British radio propaganda from Italian stations.

Dec. 28, 1937: *Expressing "growing concern"* at world events, Pres. Roosevelt indicated prospect of enlarged naval building program in letter to House Appropriations Committee chairman.

Dec. 28, 1937: *William S. Knudsen*, pres. of General Motors, announced lay-off of 30,000 workers and placing of 205,000 remaining workers on three-day 24-hour week due to business slump.

Dec. 28, 1937: *Octavian Goga, anti-Semitic*, pro-German Fascist leader, named Premier of Rumania by King Carol after defeat of Tatarescu Gov't. in elections of Dec. 20.

Dec. 30, 1937: *One-day strike of Paris utility workers* ended with compromise agreement for wage increases designed to offset rising living costs.

Dec. 30, 1937: *Pres. Roosevelt reported* directing Administration drive against monopolies in effort to reduce building costs and promote gov't.-assisted private housing boom; Sec'y. of Interior Ickes in radio speech declared anti-trust campaign was death-struggle with plutocracy.

Dec. 30, 1937: *Spanish Insurgents reported gains* in strong counter-offensive against Loyalists at Teruel.

Dec. 31, 1937: *200,000 retreating Chinese troops* in Shantung Province were in danger of being trapped by Japanese.

**Abdulhalik Hamid** (1852-1937), Turkish poet, died at Istanbul on April 13, 1937. He was one of the pioneers in the movement for purging Turkish literature of all foreign influences. Among his best known works are *Tarik Ibn Zeyad* and *Makber*. Hamid was also a distinguished member of the Turkish consular and diplomatic services.

**Aberhart, William** (1878- ), Premier of the Province of Alberta, was born near Seaforth, Ontario, Dec. 30, 1878, the son of William Aberhart, German, and Louisa Pepper, English. He was educated at Seaforth, the Hamilton Normal college, and Queen's university, taught school and was principal of Crescent Heights high school, Calgary, 1915-1935. After the Alberta general election of Aug. 22, 1935, Mr. Aberhart found himself head of the largest group returned, the Social Credit Party and on September 3 was sworn in as Premier.

Up to the present time Mr. Aberhart has not succeeded in putting his social credit plan into operation. The main idea of this plan is to set up a new monetary system and to give a dividend of \$25 a year to each citizen in the Province. Towards this end, on Aug. 4, 1937, a bill was introduced in the Alberta Legislature to licence and regulate chartered banks. This bill was passed by the Provincial house on August 6, but was disallowed by the Dominion Government on August 17. A new and similar bill was then introduced together with a bill "to ensure publication of accurate news and information." Both of these bills were reserved for assent by J. C. Bowen, lieutenant-governor of the Province. Arising out of this and at Mr. Aberhart's request the Federal Government announced on October 28 that the whole question of the right of Federal disallowance of provincial legislation would be placed before the Canadian supreme court. No decision was handed down by the supreme court in the year 1937.

**Abyssinia:** see ETHIOPIA.

**Academic Freedom** is the right of a person connected with an educational institution freely to express the conclusions resulting from his study, either orally or through publications, without interference or restraint from administrative, political, or religious authority. It is subject to limitations imposed by scholarly bodies who may insist that academic freedom shall neither cloak techniques found clearly imperfect nor violate canons of professional ethics.

The demand for academic freedom arises from the belief that the advancement of knowledge is best fostered by allowing the scholar a wide latitude in the expression of his opinions. New truths frequently conflict with accepted beliefs or social institutions.

The struggle for academic freedom which at an earlier date centred in the field of ecclesiastical doctrines and the relationship of the church to the newly emerging physical sciences, is now focused in the social sciences although conflicts in other areas are by no means uncommon.

The major scholarly associations in the United States of a general character have established committees to uphold academic freedom and tenure. This list, in 1937, included the American Association of University Professors, the National Education Association, the Progressive Education Association, and the American Federation of Teachers. Cases reported to these associations suggest that the limitations on academic freedom are most often of an indirect character. They are apt to assume such forms as holding a scholar under a year-to-year tenure, making known to him the fact that unconventional ideas will not lead to advancement, and urging withdrawal from expression or participation in controverted issues. The pressure toward conformity has been assisted by Government action. Such action has resulted in compulsory teachers' oaths of loyalty to constitutional authority and to prohibitions of radical utterances. Seventy-five such laws

limiting freedom of expression were on the books of forty-four States in 1935. In two States the mere expression of radical opinion was made a criminal offence. Legal limitations of this character have met with stout resistance in academic circles, though they have undoubtedly hampered free expression by timid or economically insecure teachers.

In 1937, fifty-eight cases of alleged violations of academic freedom were handled by the American Association of University Professors, a slight decrease from the average of the preceding four years. In the most important case, that of Jerome Davis, associate professor of practical philanthropy at the Yale divinity school, the association found Yale university guilty of "a violation of the principles of academic tenure which must be maintained if freedom of teaching or research, and of expression of opinion off the campus is to be a reality for members of the faculties of our institutions of higher learning." The other three associations were even more emphatic in their censure. They declared that in terminating Professor Davis' contract in June 1937, after thirteen years of service, the governing authorities of Yale had been swayed by opposition to Davis' writings, public utterances, and invitations to liberals to speak from a Yale platform.

**Aden.** On April 1, 1937, the administrative control of the Aden Settlement was transferred, in virtue of the Government of India Act, 1935, from the Government of India to that of the Colonial Office. From that date Aden assumed the status of a Crown colony, and the Government of India ceased to pay the fixed contribution on account of the military and political charges which it had done in the past. The transfer of control does not mean any breach in continuity in machinery and methods of government. The spirit, and in many cases the letter, of existing laws and regulations will be retained. The right of appeal in judicial cases to the High Court of Bombay, the use of Indian currency, and the maintenance of the port as a free port will continue.

The population of Aden was: Aden proper, 34,471, and Little Aden, 12,167, or a total of 46,638. The population of the Protectorate, about 42,000 sq.mi. of territories of Arab chiefs in treaty relations with Great Britain, lying E., N., and W. of the settlement is estimated at about 600,000. The number of vessels, exclusive of country crafts, which entered the port of Aden during 1936-37 was 2,088, and the number of sailing vessels and dhows, 1,145. The total value of imports was Rs. 7,08,86,985, of which Rs. 21,69,085 was land-borne.

Total exports were Rs. 4,30,70,424, of which Rs. 16,13,066 were land-borne.

Perim continues to be administered by the commissioner of police at Aden. The harbour and post office have been closed since Nov. 1936. Socotra, also under the Government of Aden, has continued the even tenor of its life.

**Adjusted Compensation.** On May 19, 1924, the World War Adjusted Compensation Act was passed by the Congress of the United States providing for the adjustment of the pay of veterans of the World War. In substance it bestowed basic service credit of \$1.00 for each day's

service in the United States and \$1.25 for each day's service overseas, with deduction on account of the \$60 bonus previously authorized and limited to a maximum of \$500 for home service and \$625 for overseas service. If service credits amounted to no more than \$50, veterans were paid in cash, payments numbering 175,186 and aggregating \$5,501,880.35 having been paid under this provision of the statute.

In the case of deceased veterans, service credits were payable to their dependents and such payments amounting to \$46,309,-681.17 have been made on 144,871 veterans' cases. To living veterans whose service credits exceeded \$50 there have been issued 3,786,556 adjusted service certificates, the face values of which total \$3,706,752,878.00.

These certificates having loan privileges are, in essence, paid-up 20-year endowment insurance policies, the maturity values thereof approximating two and one-half times the service credit. A sum of \$235,646,752.00 has been paid on 238,407 certificates because of maturity having been occasioned by the deaths of veterans.

Legislation enacted January 27, 1936 made the face values of adjusted service certificates, less any outstanding loans and interest accrued prior to October 1, 1931, payable as of June 15, 1936, upon application.

The face values of the 3,468,967 adjusted service certificates upon which certifications have been made totalled \$3,403,408,-881.00, and the amount certified as payable after deducting outstanding liens was \$1,895,902,731.46.

Payment was prescribed by the law to be made by the issuance of bonds of the United States in denominations of \$50, odd amounts in excess of any multiples of \$50 to be paid by checks. These bonds are dated June 15, 1936 and mature on June 15, 1945, but are redeemable at the option of the veteran at any time, interest accruing at the rate of 3 per centum per annum except no interest accrues on bonds redeemed prior to June 15, 1937. In settlement the Treasury Department has issued to veterans bonds totalling \$1,813,452,600.00 and has redeemed \$1,450,228,650.00 of these bonds. All data herein cited are as of September 30, 1937.

(F. T. HL.)

**Adjusted Service Bonds:** see ADJUSTED COMPENSATION; POST OFFICE.

**Adler, Alfred** (1870-1937), Austrian psychologist, who studied psychoanalysis with Sigmund Freud and then broke away in 1911 to found his own school of Individual Psychology. He considered that Freud overemphasized the influence of sex and underestimated the inferiority complex and drive for power in the individual. His theories led to new methods of psychotherapy and education. Born in Vienna in 1870, he studied medicine—first practising as an eye specialist and later as a psychiatrist. His theories gained international attention and he taught at the Long Island University College of Medicine, the Vanderbilt Clinic, the Columbia-Presbyterian Medical Center, and the New School for Social Research in New York city as well as in the schools of Vienna. It was while on a lecture tour of British medical centres that he died in Aberdeen on May 28, 1937. Among his published works were *The Practice of Individual Psychology*, *The Science of Living*, and *Pattern of Life*.

**Adult Education.** The most striking fact in the field of adult education, in the year 1937, was the steady growth of the idea that governments have a responsibility for the intellectual growth of their mature citizens.

In the totalitarian nations of Europe, this responsibility had already been accepted. If carefully controlled indoctrination is not "adult education" as it is understood in democratic countries,

it is at least the present substitute for what was adult education in those countries before their revolutionary reorganization.

The trend toward the assumption of greater governmental responsibility was indicated in most of the important meetings of the year. The Congrès International de l'Enseignement primaire et de l'Éducation populaire, convened in Paris in a favourable political atmosphere, heard reports on national programs. The annual conference of the British Institute of Adult Education, at Cambridge in September, was concerned largely with questions of citizenship. In Australia and New Zealand, a series of meetings were held at which British, European and American scholars spoke of adult education possibilities. The meeting of the World Federation of Education Associations, in Tokyo, considered similar problems.

The American Association for Adult Education gave over its annual meeting in May to discussion of the "social significance" of the movement and has begun publication of a series of books which will attempt to estimate the "social" significance of various current activities.

Important national programs developed toward stability. In the United States, the Works Progress Administration emergency classes were largely attended. To some extent their work, under public school management, has replaced much of what was formerly carried on by private and semi-public agencies. The number of teachers paid from Federal relief funds has been reduced to about 25,000, but they have consolidated their position in many local school systems. The Adult Department of the National Education Association, a professional body, passed a resolution at its June meeting advocating the use of public funds "proportionate to the demonstrated needs." Civilian Conservation Corps camps were reduced in number but enlarged in their educational programs. Federal grants as set up in agricultural and vocational extension are now being studied for reform by a presidential committee.

Tutorial classes in Great Britain, the solid core of British adult education, seem to have reached a limit of numbers. But newer and more general kinds of work are claiming a larger place in the national program. The Woman's Institutes, for example, in their twenty-first year, had a membership of 350,000. Rural music schools, a newer enterprise, showed a healthy growth. The British Institute undertook programs for the patients in several London hospitals. At Newbattle Abbey, the first Scottish residential Adult Education college, was opened in January.

Political events disrupted the illiteracy program in China. In India, however, where the educational problem is similar, a successful congress on illiteracy problems was held in Nagpur under the auspices of the National Christian Council. Swedish educational and reform societies held a first annual national conference for collaboration.

Despite setbacks in some countries, those in which democracy is still at work made evident progress in adult education during 1937 and strengthened themselves for the future by arousing greater public and governmental interest. (L. BN.)

**Advertising.** The principal developments during 1937 were increased advertising volume, changing trends in copy and layout, rapid gains in the circulation of new magazines, closer control of advertising practices through legislation and voluntary regulation, and keener appreciation of the consumer point of view.

During the year, advertising volume in the United States increased 5.7% over 1936. Radio gained 18%, outdoor advertising 15%, magazine advertising 12%, farm paper advertising 5.6%, and advertising in newspapers 2.8%. In the United Kingdom, advertising volume in national daily newspapers increased about 1%, and in provincial daily newspapers decreased less than 1%, com-

HUMOUR gives instant reader interest to this advertisement of the Philco Radio & Television Corporation, prepared by the Hutchins Advertising Company, Inc.

pared with an increase of about 10% for magazines.

**Copy and Layout.**—Advertising writing, in 1937, became more frank, terse and dramatic. Directness of expression, introduced for radio broadcasting, was transferred to the printed page. Humour became more prevalent, and advertisements resembling newspaper comic strips were used more extensively. About 300 newspapers in the United States arranged to publish such advertisements on their comic pages. Although generally humorous, this type of advertising may be serious in tone.

Institutional advertising, designed to develop goodwill toward the advertiser's business, increased during 1937. In the United States, large manufacturers, banks, insurance companies, and public utilities emphasized this type of appeal. It is estimated that 35 States appropriated a total of \$5,500,000 to advertise facilities for tourists and industries during 1937, twelve for the first time. In the United Kingdom, the Post Office and other Government agencies used institutional advertising.

Advertising headlines became shorter and more rhythmic. There was a tendency to eliminate borders and decorative designs. Bleed-type illustrations, extending to the edge of the page, became more prevalent. Rotogravure and other varieties of colour advertising were used more extensively and more photographs were reproduced in advertisements during 1937. The arrangement of some advertisements resembles somewhat the layout of a typical newspaper page, with a cluster of photographs accompanied by brief descriptions or captions.

**Advertising Mediums.**—In the United States, two new periodicals featuring photographic illustrations of current events acquired a combined circulation of more than 3,000,000 readers. This type of publication also became more popular in the United Kingdom. A few new magazines in the United States declined to accept ad-

Or seventy-five on the Watford By-Pass. You want a car that can compass either . . . without a murmur or a gasp at lowest speed, without "breathing" too hard at the highest. A car that can leap ahead at need but prefers to glide past less mobile traffic. A polite car that never appears to be making haste yet equally never needs any apologies by its owner. Proud of its behaviour as well as its thoroughbred looks, quietly sure that nothing else on wheels can make you envious, you take the wheel of such a car no longer guessing . . . no longer hoping. Now you *know*!

AMONG THE MAJOR OBJECTIVES of modern advertising copy, rhythm and compactness and especially an insistent regard for the consumer point of view stand out in this single-page British advertisement

vertising until circulation was established, others followed a consistent policy of excluding all advertising.

In the United Kingdom, the circulation of national morning newspapers, published in London but widely distributed outside the metropolitan area, continued to increase during 1937, while provincial newspapers generally retained their readers. There was a trend toward the development of two distinct types of newspapers; one publishing popular information about current happenings, the other featuring articles of the magazine type.

The production of moving picture films for advertising purposes increased during 1937. The two-reel talking film, frequently in colour, and a shorter film requiring about one minute for a showing, were used extensively in the United States. About 8,000 theatres contracted with film distributors to exhibit this latter type of film. In the United Kingdom, also, a growing interest in advertising films was apparent and they became available for use in private homes as well as theatres. Improvements in the technical processes involved in preparing advertisements were reflected in the superior quality of the finished product. Although radio stations in the United Kingdom do not broadcast advertising programs, three important stations on the Continent transmit programs in English for the benefit of British advertisers. A new radio station, which is available for this type of broadcast, was established at Toulouse, France, during 1937.

**Outdoor Advertising.**—Hoardings or poster boards in the United Kingdom became more attractive in appearance during the past year. National organizations were formed to control advertising space on networks of hoardings situated in various locali-

ties. In the United States, new methods were developed to determine the number of persons who observe window displays and outdoor advertising.

**Legislation.**—The Miller-Tydings Act, which was passed in the United States during 1937, provided that the Federal Anti-Trust Laws shall not invalidate contracts between manufacturers and distributors fixing retail prices in States where such contracts are permitted by State Fair-Trade Laws. Forty-two of the 48 States have passed Fair-Trade Acts, permitting but not requiring manufacturers to fix minimum retail prices. By encouraging competition between national and private brands of merchandise, this legislation has undoubtedly increased advertising for both types of products.

In the United Kingdom, the Select Committee on Medicine Stamp Duties, during 1937, proposed a stamp tax on medicines, drugs, and, possibly, cosmetics, amounting to about one-sixth of the retail price. If enacted, it is feared that this tax may reduce advertising appropriations.

**Ethics.**—The International Chamber of Commerce, in 1937, approved a code providing that advertising shall conform to laws and to religious, patriotic, moral, and aesthetic sentiments of the country where it is published; that advertisements shall contain no misleading statements about materials, ingredients, origin, price, value, suitability, or terms of purchase. Although this code has no force in law, it is generally recognized by large advertisers. In the United Kingdom, the code of advertising ethics recently adopted by the Institute of Incorporated Practitioners in Advertising is observed by many advertisers and advertising agencies.

In the United States, the Federal Trade Commission con-

## "G-MEN"

MORE lives have been saved by the "G-Men" of medical science than were destroyed by Alexander, Caesar, Napoleon, and all the other would-be world conquerors put together. Perhaps you, yourself, are alive and well because Pasteur discovered the nature of germs; Jenner, the vaccine for small-pox; Wright, the preventive for typhoid; von Behring, the means for ending diphtheria.

The determination of these heroes is proverbial. For example, Ehrlich made 606 unsuccessful experiments before he discovered "606"—now used in the treatment of early syphilis.

Many outstanding "G-Men" of medicine have received recognition for their great victories. Many more, unknown and unsung, are giving their lives to exploring, probing, unearthing the secret causes of disease. You hope, with everybody else, that these scientists will discover how to prevent or cure cancer; how to stop the destructive waves of influenza; how to check the early onset of heart disease.

Scientists are already producing effective serums to combat several common types of pneumonia. For the remaining types, they may soon have either effective serums for treatment or a vaccine for prevention. They have made great strides in the fight against tuberculosis. They now treat successfully certain types of blood infection formerly regarded as deadly.

The "G-Men" have shown us how to control diabetes with insulin, and pernicious anemia with liver extract. Today they are perfecting methods to ward off or lessen the severity of whooping cough, scarlet fever, anthrax, hay fever, and other diseases which have baffled doctors throughout the centuries.

Largely because of their work, the average length of life of children born in the United States this year is expected to be at least 61 years, although the children born in 1900 could hope for about 49 years and those born a century ago, considerably less. Thanks to the "G-Men" of medical science, you live in an age when more has been done to protect human life from disease than ever before, and you dwell in a community which may profit from their tireless research. You can prove your gratitude by warmly cooperating with health officials, physicians, civic organizations and hospitals that bring these great discoveries to you and your neighbors.

## OFTEN A BRIDESMAID BUT NEVER A BRIDE!

Edna's case was really a pathetic one. Like every woman, her primary ambition was to marry. Most of the girls of her set were married—or about to be. Yet not one possessed more grace or charm or loveliness than she.

And as her birthdays crept gradually toward that tragic thirty-mark, marriage seemed farther from her life than ever.

She was often a bridesmaid but never a bride.

That's the insidious thing about halitosis (unpleasant breath). You, yourself, rarely know when you have it. And even your closest friends won't tell you.

Sometimes, of course, halitosis comes from some deep-seated organic disorder that requires professional advice. But usually—and fortunately—halitosis is only a local condition that yields to the regular use of Listerine Antiseptic as a mouth wash and gargle. It is an interesting thing that this well-known antiseptic that has been in use for years for surgical dressings, possesses these unusual properties as a breath deodorant.

Listerine Antiseptic halts food fermentation in the mouth—a major cause of breath odors—then overcomes the odors themselves. The breath, indeed the entire mouth, becomes sweeter, fresher and purer. Use Listerine night and morning and between times before social and business engagements.

LAMBERT PHARMACAL CO., St. Louis, Mo.

**LISTERINE**  
CHECKS HALITOSIS (BAD BREATH)

THE IDEA IN THIS ADVERTISEMENT was first used thirteen years ago. A modern touch by the Lambert and Feasley Agency made it conspicuously effective in 1937

continued to examine newspaper and magazine advertisements. One of the commission's duties is to see that dishonest advertising is either corrected or discontinued. The American Association of Advertising Agencies, in 1937, proposed a code governing the advertising of proprietary medicines. This code provides that relief of symptoms shall be emphasized rather than complete cures; that diseases too serious for self-medication shall not be mentioned in advertising; and that advertisers shall assume full responsibility for proving their claims.

**Consumers.**—In the United States, the National Retail Dry Goods Association sponsored, during 1937, the Consumer-Retailer Relations Council. The objective of this group, which is composed of representatives of national women's organizations, large retailers, manufacturers, and Federal Government bureaus, is to encourage accurate, informative labels, uniform terminology meaning the same to dealer and consumer, truthful local and national advertising. One of the leading magazine publishers organized a consumers' division for the purpose of providing consumers with

accurate information about advertising and advertised products. The National Association of Manufacturers, during 1937, prepared a series of advertisements designed to interpret business to consumers. In the United Kingdom, as well as in the United States, there was a growing interest in scientific tests to determine the relative merits of competing products. To make advertising more useful to consumers and more effective for advertisers, the Institute of Incorporated Practitioners in Advertising in the United Kingdom, and various organizations in the United States, eliminated much of the guesswork from advertising by means of scientific research. Reliable methods have been developed to estimate the size of radio audiences.

Consumer preferences for both advertising and merchandise have been extensively analyzed during 1937 by such means as coupons, questionnaires, and personal interviews.

**BIBLIOGRAPHY.**—Among the year's outstanding books on advertising and related subjects were *Principles of Advertising*, H. K. Nixon; *Problems in Advertising*, Neil H. Borden; *Market Research and Analysis*, Lyndon O. Brown; *Radio Advertising in Australia*, W. A. McNair; *How To Write Advertising*, Kenneth M. Goode; *Modern Publicity*, 1937-38, The Studio Publications, Inc. (D. St.)

**Aeronautics.** Several countries were preoccupied during 1937 with military aviation. In Great Britain, new factories began to deliver craft under the rearmament scheme, and leading features are now available of several well-known warplanes, e.g. the *Battle*, *Blenheim*, *Harrow*, *Wellesley* ("geodetically" constructed), and *Whitley*.

In civil aeronautics, the year established the Short Empire flying-boat as an exceptionally good commercial aircraft whose originality of design should stimulate development. Five double journeys across the Atlantic were made by two of these 18-ton 200m.p.h. craft, fitted with special fuel tanks, between July and September. A fleet of 28 was put into construction.

Interest in trans-oceanic and other long-range flying is reflected in several other aircraft constructed during the year, e.g. the Boeing 72-passenger flying-boat, the 2,100h.p. De Havilland Albatross aeroplane (to be flown experimentally across the Atlantic and otherwise used as a 22-passenger air-liner), and the 5,000h.p. 27-ton Douglas. Of outstanding novelty is the Mayo composite aircraft. In the Short-Mayo prototype, the long-range craft is a 9-ton seaplane with small wings. Its low power (1,300h.p.) and heavy wing-loading (33lb. per sq.ft.) promise a cruising speed of 160-170m.p.h., but render independent take-off impossible. It is carried into the air, with all engines working, on the back of a lower component closely resembling an Empire flying-boat. But the shapes and incidences of the wings are so chosen that, on attaining a suitable flying speed, the seaplane supports its own weight and part of that of the flying-boat as well. Thus a mutually repulsive force is automatically generated to ensure rapid separation of the two components when an anchor mechanism between them is released at a suitable altitude.

Despite consequent high landing speeds, wings are still being diminished in area for given load in order to reduce skin friction and economize in structural weight, the latter being especially important, according to a recent American analysis, in connection with long range. "Split" flaps, whose value in decreasing high landing speeds was first demonstrated in the London-Melbourne race of 1934 (though they were invented 12 years previously), have been improved upon in many ways since. During 1937, preliminary experiments under the Government of India suggested that slots cut through the wings should delay the sharp stall of split flaps, and permit their safe extension along the span, sliding shutters replacing ailerons for purposes of lateral control. An addition to the series of Fairey flaps—one of retractable,

NEWSPAPER ADVERTISING (total linage in 52 cities of the United States): average per month. Compiled by Media Records, Inc.

View showing a NEW TYPE OF DE-ICING EQUIPMENT. All leading edges of the ship, including the wings, are fitted with rubber coverings which are so arranged that periodic pulsations of air through rubber tubing under the coverings break off the ice as soon as it forms. A slinger ring on the back of the propeller feeds an anti-freeze solution to the bare blades, thereby ending loss of efficiency due to the forming of ice on propeller blades

trailing-edge aerofoil type—has promised particularly high lift, with economy in operational effort. Tricycle under-carriages, familiar in pre-war days, have been re-introduced in modernized form for greater safety in high-speed landings, especially on runways slightly inclined to the wind.

New British and American engines have met a need for more powerful units, *e.g.* the ethylene glycol-cooled Rolls-Royce Merlin (990h.p.), the Bristol air-cooled sleeve-valve radial Hercules (1,150h.p.) and a double-row Wright Cyclone (1,500h.p.). At the Royal Aircraft Establishment, 2-speed superchargers have been tested to permit high altitude flying without excessive boosting at ground level. Projected fuels of even higher octane value than is now standard, together with corresponding engine modifications, promise reduction in the weight of large air-cooled petrol engines below the 1lb. per h.p. already nearly realized. This further postpones a wide adoption, for greater safety against fire, of the heavy-oil Diesel-type engines in which Germany leads. Ducted cooling has been developed sufficiently to recover, in favourable cases, more than one-half of the radiator losses, but the advantage is less with radial engines.

Three systems for de-icing—*viz.* (a) breaking away ice deposit, (b) squeezing a film of glycol from a reservoir over the exposed surface, and (c) painting with anti-freezing paste—have been under test by the Royal Aircraft Establishment on aeroplanes detailed to seek out deliberately bad weather conditions. While (c) should suffice for casual protection, both (a) and (b) may find use under severe conditions, remembering that the danger affects not only wings, for which (a) is specially suitable, but also many other parts, *e.g.* the wind-screen.

Modern aeroplanes are about twice as efficient as those of seven years ago, and substantial improvement is yet in store. Realization of this will demand an extension of aerodynamical knowledge, to which some interesting experiments have been directed. Measurements made in the compressed air tunnel should indicate more reliably the resistance of large wings under flying conditions, and eventually lead to a more accurate knowledge of skin friction with turbulent flow. Experiments on isotropic turbulence behind grids promise a better understanding of this difficult and important subject. Another investigation relates to the shock waves formed by high-speed aircraft, reminiscent of the "bore" which precedes a bullet. American photographs demonstrated such waves cast from an aerofoil at three-quarters of the speed of sound, while propeller-root interference may induce them to occur on aircraft at much lower speeds, say, 400 miles per hour. The

phenomenon is associated with sharp changes in pressure; it increases drag and tends to stall wings. The investigation aims at shaping aircraft parts to delay these effects, as has already proved possible under the extreme conditions existing near the tips of high-speed propellers.

At the turn of the year, Queen Mary college devised a new family of mathematical wing shapes which closely resemble the best forms indicated by experiment. These may prove useful whenever calculations of flow are required, *e.g.* in connection with the foregoing.

The tragic loss of the "Hindenburg" airship, after 37 Atlantic crossings, when landing at Lakehurst in May, is being made good in Germany, helium replacing hydrogen.

On June 30 Flight-Lieut. M. J. Adam flew a Bristol monoplane with a special "Pegasus" engine to an altitude of 16,440 metres (nearly 10½mi.), securing a world record for Great Britain. Regular flying at substratospheric altitudes has been organized in America, sealed cabins tapping oxygen stored in the wings. The international record for the longest flight in a straight line (10,148km., or more than 6,305mi.) was gained for Russia by Colonel M. Gromov, Comdt. A. Youmachev, and Engineer S. Danilin, flying an A.N.T. 25 monoplane from Moscow to San Jacinto, U.S., July 13–15. In November, Flying-Officer A. E. Clouston, with Mrs. Kirby Green, flew to the Cape in the D. H. Comet of London-Melbourne trophy fame in the record time of 45hrs. 6mins., returning in 57 hrs. 23mins. Miss Jean Batten won the International Aeronautical Federation's gold medal for the greatest flying achievement of 1937. (*See also AVIATION, CIVIL; AIRPORTS; AIR RACES, ETC.*) (N. A. V. P.)

**Afghanistan.** A Muslim kingdom lying between India and Persia, with an area of about 245,000 sq. mi. and a population of about 11,000,000. The ruler is H. M. Muhammad Zahir Khan since 1933. The country has been admitted a member of the League of Nations, and has now a constitution, with a Council of Ministers, a Senate (40 nominated members) and an Assembly (120 elected members). After the latest Afghan-British War of 1919, a treaty was signed by which Great Britain recognizes the complete independence of Afghanistan and exchanges Legations.

The capital is Kabul (pop. 80,000); Kandahar (60,000) and Herat (30,000) being the only other towns of importance. The official language is Persian, which is generally understood by the educated classes, although Pushtu is spoken in the south and east. No reliable statistics of the ordinary type are available, in respect of education, finance, agriculture, commerce or the like. There are no railroads in the country, but motor traffic is extending and various factory industries are being opened up. The trade with India through the frontier passes is considerable: exports being fruit, carpets, wool and skins: imports cotton and piece-goods, metals, sugar and tea. There is no record of the similar trade with Russia and Persia. The year 1937 was one of unusual quiet in this turbulent land. (ME.)

**Agriculture.** Among the most striking factors affecting agriculture in recent years are: the world-wide efforts to restore prices by increasing tariffs, establishing quotas for imports, giving bounties for exports, government restrictions on production and marketing, price fixing, and monetary changes. Governments are also giving increased attention to planning the uses of land for agriculture, forests, recreation, and other purposes. Better transportation is resulting in an increase in rural living, and part-time farming by persons who work at other occupations.

In the technical operation of farms, one of the striking changes is the improvement of the tractor and particularly the mounting of tractors and other farm machinery on pneumatic tires. Changes in cropping systems usually take place slowly, but the expansion of cotton production in countries other than the United States has been striking. The acreages of some crops such as fresh vegetables and soy beans in the United States and cocoa in Africa have increased rapidly.

Steady technical progress is being made on methods of production, particularly in disease control, and in the use of hybrid seed corn in the United States.

**Falling Prices.**—Wholesale prices of food products in seven countries, expressed in pre-war gold currencies, rose from an index of 100 before the World War to 226 for the year 1919. From this high level, two striking declines occurred, one in 1920, which carried prices to about one-third above pre-war, and a second in 1929, which carried prices to about one-third below the pre-war level. In 1934, prices in gold were less than one-third of what they were in 1919. The decline was world-wide for prices expressed in gold as shown in Table I. The decline was greater in regions far from market because costs of handling remained high. Prices of textiles rose even higher and fell lower. The index of wholesale prices of cotton, silk, wool, and other farm textiles rose to 301 in 1918 and fell to 55 in 1932, or more than four-fifths.

Whenever prices fall, prices of farm products and other raw materials decline more than debts, taxes, wages, transportation charges, prices of manufactured goods, and administratively set

prices. These relatively inflexible prices become of increasing importance with passing time. It is, therefore, more difficult than formerly to meet severe price declines.

With a high standard of living, there is always a high degree of division of labour. This means that farmers in such a society become less and less self-sufficient. They produce large quantities of products to which the area is well adapted and buy from others most of their business and living requirements. This increasing specialization makes the effects of falling prices more serious than formerly.

The effects of rising and falling prices on price disparity are illustrated by prices in the United States. With rapidly rising prices, prices paid for food products in the United States reached an index of 181, in 1917, when pre-war is 100. The index of the cost of distributing these same foods had risen to only 129, so

STACKING GRAIN before threshing on a farm near Perth in Scotland

Fig. 1.—PHYSICAL VOLUME OF PRODUCTION OF ALL CROPS FOR THE UNITED STATES, 1870-1937. The long-time gradual increase was seriously interrupted by the depression as well as by the droughts of 1934 and 1936. Instead of high production during the depression, production was low

that retail prices of the same foods were only 156.

Costs of distribution are largely labour. The average weekly earnings of New York factory workers give a fairly good index of city wage rates. These had risen only 32% by 1917, which accounts for the small increase in costs of distribution. By 1920, farm prices had doubled, but costs of distribution had also doubled so that retail prices had about doubled.

With rapidly falling prices, there were relatively small declines in wages so that the costs of distribution remained high, and prices of farm products were low relative to retail prices for the same products. For example, in 1925, retail prices of food in cities were higher than in 1917, but the farm prices of the same foods were considerably lower than in 1917. This situation was further accentuated by the later collapse in prices.

In February 1933, food at retail was practically at the pre-war level, but farmers received only about one-half of pre-war prices, because wages and other costs of distribution had declined only a limited amount.

The price disparity, both with rising and falling prices, is greatest in regions far from market. Index numbers for prices in Australia, South America, Western United States, and Western Canada were higher during the periods of rising prices than for Eastern United States and Western Europe. When prices fell, they fell most severely in the outlying regions, because costs of distribution remained high.

Innumerable explanations have been advanced to explain the collapse in prices, such as overproduction, under-consumption, imports, monetary causes. Corresponding remedies have been attempted. One of the most popular explanations was overproduction. Those who held this point-of-view had observed that a large supply reduces prices.

They reasoned that, since prices were drastically reduced, there must be a drastic over-supply. Statistics of production of farm crops do not indicate any violent general overproduction either in the United States (fig. 1) or in the world. Here and there, there was an unusually large supply of something, due to favourable weather; but this is a frequent occurrence. After the depression had continued for a time, consumption of certain products such as cotton was reduced so that supplies accumulated; but this was a result of the depression and not its initial cause. The physical

WHEAT PRODUCTION in nine important countries of the world—a graphic representation

volume of production of crops in the United States and prices of these products are shown in fig. 2. There was no increase in the output of farm products that could have caused the depressions of 1920 and 1929.

The rise and collapse in prices occurred in all gold-standard countries. A similar simultaneous rise and collapse did not occur in silver countries. The rise and collapse also varied in different countries depending on the monetary procedures followed. The depression of 1920 did not occur in countries that were inflating their currencies at that time.

Nearly all countries attempted to cure declining prices by reducing or prohibiting imports. This strong wave of nationalism not only checked the normal flow of international trade, but also stimulated attempts to produce farm products not well adapted to the region in order that each country might be self-sufficient. This movement had serious consequences which will continue for many years. It was not the initial cause of the depression but came as a result of it, and increased its severity.

Most countries tried some scheme for limiting production. Denmark and Holland limited the number of pigs that could be raised for sale. Holland destroyed tulips; Brazil destroyed coffee. The United States plowed under cotton and slaughtered pigs. Innumerable schemes for quotas for production and marketing were tried. Sometimes the limitation of production in one country caused an increase in another country. The United States plowed under one-fourth of its cotton crop in 1933; held a portion of the crop off the market; and limited the acreage planted in 1934. For many years, other countries had been producing a little less than half the world supply. A rapid expansion took place and production in other parts of the world in 1937 was nearly 50% higher than the production in 1933. (See Table III.) A part of the expansion in other countries undoubtedly was due to the restriction of production in the United States.

**Gold Standard.**—Those who believed that the depression was due to under-consumption advocated the redistribution of purchasing power by giving money to certain groups in the population, by

Fig. 2.—PHYSICAL VOLUME OF PRODUCTION OF CROPS IN THE UNITED STATES AND PRICES OF CROPS, 1910-1937. Production was generally low during the period of low prices

make-work programs, or by compulsory wage increases. Those who believed that the depression was due to the rising value of gold advocated a reduction in the gold content of the monetary unit. Every gold-standard country reduced the gold content of its currency by devaluation or by leaving the gold standard. In general, those countries that were primarily agricultural and were far from market made the greatest reduction in the metallic content of their currencies. Before 1938, Australia and New Zealand had reduced the gold content of their currencies by about one-half. The Argentine reduced the gold content of the peso by about 55%. The United States and England made reductions of about 40%. In January 1938, very few countries were on the gold standard, so that the reductions were not specific.

Appraisal of the innumerable relief efforts will gradually be made after the controversies have passed. In general, those countries that left the gold standard at a time when prices in gold were declining stopped the price decline. Those countries that left the gold standard at a time when prices were not changing violently had a rise in prices. The latter type of adjustment is shown by the experience of the United States (fig. 3). The United States left the gold standard and began to raise the price of gold at a time when commodity prices were declining gradually. Prices in currency rose rapidly. (See also GOLD RESERVES AND GOLD STANDARD.) Even after the price decline in the latter part of 1937, United States prices of 40 basic commodities were 77% higher than for February 1933. The type of adjustment that took place in the price structure is shown by a comparison of the prices paid to farmers for food and the cost of living. The cost of living index is very resistant to price declines because it includes so many wages and other slow-moving charges. Although prices paid to farmers for food products in December 1932 declined to 57, when pre-war is 100, the cost of living index stood at 132. With rising prices, prices paid to farmers in June 1937 had more than doubled, but the cost of living index had risen only 11% (fig. 4). Not hav-

Fig. 3.—INDEX OF 40 BASIC COMMODITIES IN THE WORLD AND THE UNITED STATES IN GOLD, AND IN THE UNITED STATES IN CURRENCY, 1928-1937. Commodity prices in the United States followed the world level until 1933 when the United States raised the price of gold. Since 1934, commodity prices in the United States have been about 69 per cent above the world level

1936-37	12,387	17,813	30,200	59
1937-38†	17,350	20,100	37,450	54

\*In 1933, the United States is reported to have plowed under 4,400,000 bales. If this had not been done, the proportion of the total crop grown in other countries would have been 44 per cent.

†Figures for 1937-38 are preliminary.

ing fallen much, the cost of living index had little occasion to rise much. The cost of living in 1937 was high compared with prices paid to farmers.

A further rise in prices would bring the two into balance. A still further rise from that point would leave farm prices high when compared with the cost of living.

The tariff and quota regulations to prevent imports in various countries are so numerous as to make any brief discussion impossible. With rising prices, there is a tendency to make slight reductions in the severity of some of these provisions.

**Drought and the Dust Bowl.**—Most of the rainfall of the central plains of the United States and Canada is carried north from the Gulf of Mexico. The farther from the Gulf, the less the rain. There is a large area east of the Rocky mountains but west of the Gulf of Mexico which is not in a direct line of winds coming from

THREE POWER-FARMING OPERATIONS in one, discing, harrowing and rolling, on a New Zealand farm

the Gulf. This area, particularly the part west of the 100° meridian, is generally short of rain and is subject to extreme variation in the amount of rain. For ages, this area has been subject to wind erosion.

In fact, much of the best soil in the area and considerable land east of the dry belt is loess, or wind-blown soil. Severe droughts in recent years have called attention to the dust storms, particularly when clouds of dust floated at high elevations over New York city. Such storms are new to the present generation but occurred in the early pioneer days when droughts were severe. The amount of blowing has been accentuated by the droughts of 1934 and 1936 and by the plowing of large areas. It is now generally conceded that it was a mistake for the Government to encourage the breaking up of these lands for tillage purposes. Unfortunately, the re-establishment of the native grasses is a very slow process, and the farms would need to be much larger if they were to depend on grazing.

Two of the severest droughts since the settlement of the West occurred in 1934 and 1936. The corn crop of 1934 was the lowest yield per acre harvested ever reported, and the second lowest yield occurred in 1936. Large areas were a complete failure, so that the yields per acre planted were even worse than the statistics indicate. (See also DUST STORMS.)

Since most of the agricultural production of the United States is in the area with continental climate and much of it is in the high plains area east of the Rocky mountains, crop yields are decidedly variable. For example, less than 41,000,000 ac. planted to winter wheat for the 1925 crop produced 401,000,000 bushels. The next year, a slightly smaller planting produced 632,000,000 bushels. A larger planting in 1933 produced only 351,000,000 bushels.

The cotton crop of 1937 was nearly 19,000,000 bales, the largest on record. If the yield per acre planted had been no better than the yield in 1923, the crop would have been less than 10,000,000 bales. Variations in production are due more to variations in yields than to acreage planted.

**Land Planning.**—The agricultural depression had turned the attention of many Governments to various phases of land planning, particularly to reforestation and rural homes for urban workers. Forests have many uses aside from the production of lumber. They hold back rain and snow and thereby regulate stream flow, reduce erosion, provide hunting and recreational facilities, and are of value in many other ways that do not accrue to the individual owner but are of benefit to the country as a whole. The necessities of the individual owner sometimes require that he cut the lumber before it should be cut and in a manner that does not adequately provide for the future. For these reasons, most countries are moving towards public ownership of considerable tracts of forest lands. Some countries do not allow the private owner to cut the trees without a permit. The State of New York had at one time practically disposed of all the land of the State. During the past fifty years, it has reacquired more than ten per cent of the area of the State for forest and recreational uses. The United States Government discontinued disposing of forest lands some years ago and has now turned to a policy of reacquiring lands for reforestation and recreational uses. (See also FORESTRY AND REFORESTATION.)

In most countries, the Governments have taken steps to encourage small land holdings. These are often called farms but are usually too small for efficient operation. They are efficient when used for homes for persons who work in industry. This movement has been greatly accentuated in the United States by the building of good roads and the general use of automobiles. The increase in efficiency tends to reduce the portion of the population living on farms. The movement for rural homes for urban workers tends

to check the decline in rural population. The automobile is also making rural recreation more available to urban workers. By these means, the balance between the rural-minded and urban-minded may be better maintained. The movement for rural living for the urban worker promises to go much farther. By rural living, the cost of living may be reduced and supplementary work provided for members of the family not working in industry and work may be provided for the industrial worker when not fully employed. Many persons prefer the greater freedom and "elbow room" which rural living makes possible.

**Technical Developments.**—Better control of plant disease is making rapid progress through use of seed that is free from disease, seed treatment, use of disease-resistant varieties, spraying, and the like. One of the striking cases is the rapid increase in the use of certified seed potatoes. Such potatoes are mostly grown in northern areas with a cool climate. The fields are inspected during the growing season by pathologists of the experiment stations. If plants pass the various inspections, the seed is certified. A high percentage of the potato area in the United States is now planted with such seed.

Potatoes show striking increases in yield per acre. The average yield in the United States for the 20 years, 1918 to 1937, was 108.8 bu.; and for the 20 preceding years, it was 95.3 bushels. In the 56 years; from 1866 to 1921, there were only 9 years when the average yield exceeded 100 bushels. Since 1921, there has been no year when the yield was less than 100 bushels. This increase is due to better seed, disease control, use of fertilizer, and the like. It is also due in part to the expansion of potatoes in areas better adapted to their production, and the contraction of production in the less favourable areas. (See also POTATOES.)

Another spectacular development, which is just coming in, is the use of hybrid maize or Indian corn seed. Corn is normally cross-fertilized by the abundance of pollen produced by the surrounding plants in the field. In producing hybrid seed corn, the plant is artificially self-fertilized for several generations until the strain is considerably purified. Another strain is similarly self-fertilized. These are then planted so that they will cross-fertilize to produce the hybrid seed. The self-fertilized plants are reduced in vigour, but seed produced from the first hybrid cross has remarkable vigour and usually greatly out-yields ordinary corn. Since the amount of corn required to plant an acre is small, it is possible to go to considerable expense for the continuous maintenance of in-bred strains and the production of hybrid seed. Corn often has a high moisture content and is frequently seriously injured for seed purposes by freezing when moist. Those who produce hybrid seed have facilities for drying and storing the hybrid

Fig. 4.—INDEX NUMBERS OF THE COST OF LIVING AND FARM PRICES OF FOOD IN THE UNITED STATES, 1928-37. From 1929 to 1932, the cost of living fell 23 per cent, whereas farm foods fell 61 per cent. From December 1932 to June 1937, the cost of living rose only 11 per cent, but farm foods 123 per cent

seed, so that results of better care of the seed further increase the yield.

The increased yield is generally approximately in proportion to the base yield. In areas where corn yields are fairly high, an increase of as much as 10 to 15 bushels per acre is not uncommon. Such seed is not much used in regions with low yields. (See also CORN.)

Changes in the average yield per acre of any crop in any nation take place slowly. It is therefore very easy to overemphasize such changes based on results from certain farms or laboratories. It does seem possible that hybrid seed corn, the use of which is rapidly spreading in the corn-belt, may increase the yield of the entire corn-belt by several bushels per acre. If so, it will be unusual and spectacular. However, no increase is yet evident for the country as a whole. But an increase of several bushels per acre in the better parts of the corn-belt is not improbable, and some farmers are already profiting greatly by the use of such seed, and others, by its production.

**Internal Combustion Engine.**—The increasing use of tractors, trucks, and automobiles is profoundly affecting agriculture. The automobile and truck have reached a stage of development where the changes from year to year are moderate. The tractor is still in the stage of rapid development. The most striking recent development is the use of pneumatic tires, not only on tractors, but on various farm machines. One of the effects of the uses of tractors, trucks, and automobiles is the permanent reduction in the number of horses in the United States. The developments that have thus far occurred have practically eliminated horses from cities and industrial plants and have reduced the

number of horses on farms by about one-half. The number of mules on farms has been reduced much less, because the tractor is too large a tool to be used in the South where the mule is primarily used. In 1900, there were nearly five horses on farms for each mule, but by 1937, there were less than three horses for each mule.

The reduction in the number of horses is resulting in some reduction in the number of acres of oats and hay. The excellent market for hay near large cities has disappeared. A reduction has occurred in the price of oats in terms of other farm products.

Timothy hay was preferred for horses but is less valuable than clover or other leguminous hay for cattle. A shift is therefore occurring in the type of hay produced. On the basis of tons produced, alfalfa is now the leading type of hay in the United States. In 1937, it represented 37% of all tame hay.

The tractors, trucks, and new machinery are increasing the disadvantage of farms that are too rough or too stony or for other reasons are not adapted to machine operation. They are making it possible to operate farms at a greater distance from the farmstead. The truck is greatly facilitating the marketing of farm products. About half the use of farm automobiles is for business use. This greatly facilitates the marketing of farm products and the purchase of supplies.

**Population Engaged in Agriculture.**—With passing time, the percentage of the population engaged in agriculture steadily declines. Farmers become more efficient, so that fewer of them are needed to feed a given population. This released population going into the production of other things is an important factor raising the standard of living.

Table V.—Percentage Distribution of Occupations of Gainfully Employed Persons

[illegible]

HERDING SHEEP in New South Wales, Australia

The countries with the greatest division of labour have the greatest efficiency per worker, and consequently the highest standard of living.

The percentage of the population engaged in agriculture in countries that produce most of their own food supply varies from 21 per cent in the United States to 68 per cent in India. In the United States, 83 per cent of the population was engaged in agriculture in 1820. (See also CROP CONTROL; FERTILIZERS.)

(G. F. W.; F. A. Pe.)

**Agriculture, Department of:** see GOVERNMENT DEPARTMENTS AND BUREAUS.

**Air Conditioning.** The year 1937 marked a substantial advance in the total installed horse-power of air-conditioning apparatus, as well as a rapid expansion in the general acceptance and understanding of the art. The following table outlines the growth of air conditioning during the last few years:

Year	Horse-Power Installed
Prior to 1933 .....	170,000
1933 .....	20,000
1934 .....	50,000
1935 .....	72,000
1936 .....	88,000
1937 .....	147,000
TOTAL .....	547,000

From the above it will be seen that the total installed horse-power is now well over the half million mark; that the additional horse-power added in 1937 is nearly as much as the total installed prior to 1933, and that 1937 represents about a 60% increase over 1936.

A number of definite trends are particularly important in the industry, as follows:

(1) **Unit Conditioners.**—It has been a generally accepted fact that the built-in central plant system provides the best performance at the lowest cost wherever a number of rooms, or where one large room is to be air conditioned. This is still true, but quite recently unit air conditioners of improved design and of

relatively low cost have been produced, which give excellent performance in single rooms. The smaller of these conditioners are air cooled and have capacities somewhat less than one ton. (A ton of capacity is equivalent in cooling effect to the melting of one ton of ice in 24 hours.) Such a conditioner embodies a refrigerating unit, blowers, control and filters, all mounted in a cabinet of pleasing appearance, and it is entirely portable, except for a duct connection to the window, in order to supply outside air for condenser cooling and ventilation. This conditioner cools, dehumidifies, circulates, and cleans the air in the room, as well as providing outside ventilation air for odor control. It is designed primarily for single rooms in homes and apartments, as well as for private offices.

Also, there are larger unit conditioners available up to several tons capacity, for use in small stores and shops, as well as large offices. These are quite similar to the ones just described, except that they are water cooled instead of air cooled. Also, they are designed to deliver the conditioned air in a horizontal plane, about eight feet above the floor, where—because it is heavier than the air in the room—it falls slowly to the floor, giving even distribution without objectionable draft.

(2) **Central Plant Conditioners.**—The built-in central plant system is still the standard and proved method of air conditioning for most applications, although they have until recently presented the problem that no two conditioners are exactly the same. Each must accurately fit the application in number of included functions, capacity of each function, air flow, pressure drop, and power supply. Therefore, the usual procedure was to purchase various parts from the most convenient suppliers and assemble them on the job. Hence, there was divided responsibility and lack of skilled factory design and testing of the unit as a whole.

Today the reliable manufacturer, by means of a relatively few ingeniously designed sub-assemblies, makes available many thousands of combinations. Thus, the purchaser receives a central plant air conditioner which is custom fitted to his exact requirements, and at the same time it is completely factory designed, factory built, and factory tested. The responsibility for its successful performance is undivided.

(3) **New Applications.**—There is now an established trend toward air conditioning in the home. A great majority of the new homes built above the \$7,500 class, and many below this class, install winter air conditioning, with all the advantages of heating, humidifying, circulating and filtering. Many of these homes either install summer air conditioning with cooling and dehumidifying, at the same time, or they make provision for adding it later, using the blower, filters, ducts, and grilles of the winter conditioning system.

Air conditioning for large stores and theatres has long been established, but now it is rapidly spreading to even the very small stores and theatres, as a sure way to attract more trade

INTERIOR VIEW OF LARGE AIR CONDITIONER for central installation, showing humidifying apparatus and motor for diffusing fresh, cool or warm air

and increase profits. Two relatively new classes of application are apartments and hotel guest rooms. Both of these are growing rapidly, using unit conditioners for one or two rooms, and central plant conditioners for a group of rooms.

(4) **Benefits of Air Conditioning to Health.**—The benefits of air conditioning to health are not yet fully identified, although knowledge on this subject is improving. The benefits to hay fever and pollen asthma sufferers are well known. The benefits to convalescents and post-operative patients are becoming more and more understood. It is indicated that air conditioning may go a long way toward eliminating the inconvenience, lost time, and suffering which come from the common cold. Air conditioning does not directly kill bacteria, nor does it produce sterile air. It does, however, substantially reduce the bacteria count in the air, to the point where the natural body immunity can usually fight off the ravages of the remaining bacteria. (EL. HA.)

**Aircraft Carriers:** see AIR FORCES; LONDON NAVAL CONFERENCES; NAVIES OF THE WORLD; REARMAMENT.

**Air Forces.** Air forces constitute a highly mobile and powerful combat element which, in co-operation with other arms, or independent thereof, conducts the air operations required for carrying out the missions of the army. The essential characteristics of air forces are mobility, and the power to observe and to attack objectives on land, at sea or in the air. Aside from hostile counter missions this power is limited only by the radius of action of the air forces.

Air forces are divided according to the purpose for which their constituent aircraft are designed, into the following classes: (a) *Bombardment aviation* is equipped, organized and trained to destroy material objectives. It is capable of applying its destructive power effectively to a wide variety of objectives, such as naval vessels, bridges, dams, railroads, buildings, and other substantial structures. (b) *Attack aviation* is equipped, organized and trained primarily to destroy personnel and light material objectives. It is suitable for employment against troops on the march, in camp, in bivouac, in light shelter, in boats or small ships. (c) *Pursuit aviation* is equipped, organized and trained primarily for air combat. It is employed to support bombardment, attack and observation aviation; for interdicting enemy bombardment and attack aviation; and to deny operations to hostile observation aviation. (d) *Observation aviation* is equipped, organized and trained to observe and report upon all activities which are visible from aircraft and of interest to a military commander. *Transport* and *training aviation*, the two additional types, are non-combat classes.

Air forces in the United States comprise: (a) those assigned to and constituting the GHQ air force, (b) those assigned to and constituting an integral part of corps and armies, (c) those assigned to each of the overseas departments; and (d) those assigned to the zone of the interior. The General Headquarters Air Force combines the air corps tactical units in the continental limits of the United States. The commanding general of that organization directs and supervises the training activities and tactical manoeuvres of that force. The thorough and efficient work performed by the GHQ air force has resulted in a present high state of tactical proficiency, stressing individual combat crew performance. Training concludes with tactical manoeuvres involving the transfer of groups and wings from coast to coast to perfect tactical mobility.

The chief of the air corps directs the aeroplane, engine and accessory procurement activities, builds and defends the budget, and supervises the technical training of air corps personnel. He is also charged with the procurement, classification, and evaluation of all personnel in the army air corps. He advises the war

AIRCRAFT CARRIER, U.S.S. "Lexington"

department on aviation matters.

A wide divergence of opinion has been expressed regarding the size and effectiveness of military aviation in the United States. One view holds this country to be decidedly inferior; the other contends that she possesses one of the most powerful air forces in the world. This variance probably arises from a confusion between quality and quantity. The U.S. army possesses more than 1,100 first class military aeroplanes. Obligations have been made or plans have been laid looking toward the provision by June 30, 1940, of a total of 2,320 modern aeroplanes for the army air corps. Several other air powers of the world now exceed the United States in numbers. In quality, on the other hand, its aeroplanes, engines and accessory equipment are superior. Type for type, no better flying equipment is available anywhere in the world.

The military policy of the United States is defensive and not aggressive. Its air force has been developed, organized and trained pursuant to that established and recognized directive. It must be measured with its probable missions continually in mind.

(O. WE.)

**Navy.**—The primary mission of naval aviation is to further the capabilities of the navy and thus permit it more efficiently to perform its required functions. Organized initially with this aim in mind, the development, carried on during subsequent years, has proved the wisdom of this course. Today American naval aviation has reached the position where it is one of the most highly developed and efficient possessed by any country. It is firmly believed that this position is due to the fact that the development has been carried out entirely by and within the navy. The fact that aviation is an integral part of the navy makes it strictly a naval air force. It is a project of the officers and men of the regular service who serve on naval vessels in the capacity of the regular naval officers. As a result, the development of tactics has made for harmonious and efficient co-operation between air, surface, and sub-surface units to a point where aircraft in fleet operations are as much an indispensable part of the whole as are cruisers, destroyers, or submarines. At the same time, naval aviation has contributed directly to the fleet, through the medium of the landplanes of the carriers and the long-range patrol planes, a mobility over the sea which otherwise would not have been achieved.

All combatant ships of the navy, with the exception of the destroyers and submarines, carry their own complement of aeroplanes, varying in number from three on the battleships to 76 on the aircraft carriers, the type of aeroplane used being determined

by the mission of the surface ship to which it is attached. These requirements have brought into being aeroplanes possessing mechanical features and capabilities that differ greatly from aeroplanes operated by land-based military forces and by commercial aviation establishments. Continuous efforts have been made to keep to a minimum the number of types, by designing each to perform the maximum number of functions, with a view to reducing manufacturing and maintenance costs.

Aircraft operating from aircraft carriers may be considered as (1) offensive; those operating from carriers and battleships as (2) service; and those operating from shore bases as (3) local defence. The offensive aircraft (1) includes fighters, torpedo and bombing, dive bombers, and carrier scouts. The service type (2) includes cruiser scouts and battleship observation planes. The local defence planes (3) include the patrol and patrol bomber flying boats. Miscellaneous craft which are not designed strictly for military functions includes the training, ambulance, utility and transport planes.

The following is a brief description of these basic types:

(a) The fighting plane, representing the maximum in performance, manoeuvrability, and gunnery, is small and high-powered, with the primary mission of attacking enemy aircraft with gunfire.

(b) The torpedo and bombing planes, the largest type employed in the carriers, are designed to attack enemy heavy vessels or shore bases. An important type under this classification is the dive bomber, which, as its name suggests, delivers its bomb attack in a vertical or near-vertical dive on enemy units, either ashore or afloat.

(c) The scouting and observation planes require speed, range, good gunnery defence, and excellent facilities for radio, in order to accomplish their missions of scouting for the cruisers and carriers and observing for the battleships.

(d) The patrol plane is the largest type in service in the navy, its size being necessitated by the fact that the craft must be capable of great range, be thoroughly seaworthy, and sufficiently habitable to permit operating for protracted periods independent of its base. In addition, the patrol plane must be self-protecting while carrying out long-range strategic scouting flights, and must be capable of joining the fleet at any time.

On January 1, 1938, the American navy had on hand approximately 1,000 first-line planes and approximately 800 additional on order. When the present program, planned to meet the requirements of the Vinson-Trammell Bill, is completed, the navy will have approximately 2,000 aeroplanes on hand. The completion of this program is scheduled for the year 1941.

Naval aviation today constitutes a striking force that has gone far toward increasing the value of the naval forces. The persistent increase in the capabilities of aircraft and aircraft equipment permits the logical assumption that naval aviation will undertake an additional percentage of the work and responsibility of the fleet, thus increasing the mobility and enlarging the sphere of power and efficiency of the United States' first line of defence. (See also *ARMIES OF THE WORLD: Aeroplanes and Tanks*; *WORLD ARMAMENTS*.) (A. B. Co.)

**The World.**—Air strength is normally reckoned in terms of first line aircraft—which represents the number of machines actually in service with formed units. Subject to certain qualifications, it gives a reasonable idea of the number of aircraft which could be engaged on the outbreak of war, and thereby enables some calculation of the scale of air attack that a country might launch. For each first-line machine, most countries aim to maintain three or four in reserve, to make up the wastage that is likely to occur during the first few months of a struggle, before the factories can attain their expanded war rate of production.

In these matters the difficulty of penetrating the veil of secrecy,

combined with the apprehension of being bombed, gives rise to a natural exaggeration. In the case of the German air force, for example, its creation and expansion have been carried out with such secrecy as to encourage extreme estimates. Thus in 1934 the public abroad was startled by the declaration of a great newspaper magnate that Germany had 25,000 military aircraft. In 1935 he gave fresh figures—to the effect that Germany possessed 10,000 bombers each capable of carrying about a ton of explosives. If the estimate had not mounted as one might have expected, considering that there had been a year's interval for expansion, the picture was certainly painted on a large canvas. The Russians have a reputation for generous-size estimates of German military preparations: at the same period the Assistant Commissar for war credited the Germans with a total of 3,700 military aircraft, including reserves. Even this figure was considerably in excess of what French experts calculated—and the French, since 1914, are not inclined to minimize any menace that Germany possesses.

Actually, there is reason to doubt whether, at the end of 1935, the first-line strength of the German air force much exceeded a total of 600 machines. Expansion, however, has been moving rapidly to overcome the disadvantages of a late start. It is probable that by the spring of 1937 the German air force attained what is believed to have been its original goal—a first-line strength of 1,500 machines. That it did not reach this earlier was due to the difficulty of training personnel and organizing units as fast as the manufacture of machines, which has been proceeding at a rate that was probably in excess of the capacity to absorb them. The accident rate in training is reported to have been extremely high, although the details have been hidden. Another significant feature of the German air force is the high proportion of bombers of various types. Fully half the force appears to be composed of bomber squadrons of various kinds, and more than half of these are equipped with large machines that can carry a bomb-load of upwards of a ton, with a radius (out and back distance) of about 400 miles—far enough to reach the capitals of any of Germany's neighbours. But while the aeronautical properties of the German machines are good, those which have been seen in the Spanish war have compared unfavourably in speed and armament with the bombers of Russian, Italian, and American manufacture. The German fighting machines have been more impressive, although even with these their effectiveness and value have fallen off badly at heights over 12,000ft. Newer types of heavy bombers are coming into service, with a speed of over 200m.p.h. At the same time it is believed that a further expansion of the first-line strength is in progress, and by the spring of 1938 a total of 2,200 machines may be reached. The ultimate goal may be a first-line strength of 3,000 machines, with reserves of at least equal size.

In the past Germany specialized in the construction of civil aircraft that were easily and quickly convertible into military machines, and probably a further 200 could have been reckoned on this account. This asset, however, is now losing much of its old significance with the achievement of the air force expansion. So long as Germany was trying to hide the fact that she was developing a military air force, it was convenient to have a reserve of pseudo-civil machines that could be converted into bombers in emergency. Now the need for this device has passed. Nevertheless the pilots and personnel carry out several months' regular training each year, and there is little doubt that in war they would be immediately formed into regular squadrons, equipped with military aircraft which are held ready for them in peace time. The civil aircraft themselves would more probably be used for training purposes.

There are auxiliary and sports associations, in which well over 5,000 pilots are said to be in training; from these might emerge enough squadrons to form an additional force of 300–400 ma-

chines, besides providing reserve pilots for the regular air force.

Italy is another country where the veil of secrecy has been tightly drawn. Since the expansion which followed the coming of the Abyssinian war, her actual first-line strength is probably about 1,500 machines, and may reach a total of 1,800 by next spring. About a third of them are said to be bombers, while a considerable proportion of the fighters are designed for attack on ground targets. Out of the present number, nearly 200 are said to be still in Eritrea and Somaliland, engaged in clearing up the Abyssinian situation, and about the same number is in Libya and the Dodecanese. Her intervention in Spain has also entailed a considerable diversion of strength. But Italy can probably exercise the strategic mobility of her air force better than any other country with overseas possessions. For she can concentrate at home in peace, for training, and yet reinforce Libya and the Dodecanese at short notice whenever required. This strategic mobility is growing with the extending range of aircraft—and Abyssinia as well will soon be reinforcing by air as easily as Libya is today. Italy has now a large output of new types of bombers of high performance, with a speed of about 220 m.p.h. and a radius of nearly 500 miles. These have been turned out by the factories as fast as possible. With such a radius it would be possible, from Libya, to reach, not only Alexandria but Port Said, and also the ports in southern Greece. Only the extreme ends of the Mediterranean would be beyond their reach. On the other hand, her strategic situation as a whole has weaknesses so marked that, on a sound calculation, they should be a check on rash impulses. Apart from the fact that so large a part of her land forces and resources are engulfed in East Africa, precariously dependent on a tenuous lifeline from the homeland, Italy's own situation has handicaps that are inherent in geography: her long coastline, the narrowness of the country, and the nearness of her main centres to the sea or to neighbouring frontiers, are factors that cannot be ignored. The factories which produce her new long-range instruments of warfare are themselves within uncomfortably short range of the less obvious points from which the forces of other countries might take off. Compared with France, for example, the strategic situation of Italy is on balance unfavourable for any contest in the air. Her vital centres are far more accessible than are those of France to the Italian air bases.

France, which for long had the largest air force in the world, has dropped behind. Her difficulty, indeed, has been to maintain the numbers she had while re-equipping them with new types and providing adequate war reserves. It is probable that her first-line strength early in 1937 was not much more than 1,400 machines, and of these barely 1,000 were available at home, half of them bombers, the rest being overseas, in North Africa, the Levant, Indo-China, etc. Moreover, most of the French machines are not of a very modern type, although new types of greatly improved performance began to come into service gradually from the early months of 1937. The number, too, is being increased 50 per cent. An existing factor which has to be taken into account is that France's proportion of bombers is much less than Germany's. But the new French machines will be of much larger bomb-capacity than at present.

The strength of the British air force, before an expansion program was somewhat hurriedly embarked on in face of the ominous European situation, amounted to only 880 first-line machines. The process of expansion, moreover, has been complicated by Italy's invasion of Abyssinia and the consequent tension in the Mediterranean: the diversion of instructors to emergency duty naturally interfered with the training of new personnel. At the end of 1936 the total regular strength was just over 1,100. But the needs of India and the other overseas territories, as well as of the navy, reduced the total regular strength at home to a little under 900

first-line machines. Under the present program of expansion, it was intended to reach a total of 1,500 by the spring of 1937, and 1,750 by the autumn, but the completion of the program has suffered from delays. The Fleet air arm has at present a first-line strength of some 220 machines, but five new aircraft-carriers of great size are now being built, and when these are added to the existing five, the total strength carried at sea will be little short of 700 machines. The new machines with which the British air force is being equipped include what are stated to be the fastest single-seat fighter and the fastest medium bomber in the world, the latter having a speed of 280 m.p.h. and the former considerably over 300 m.p.h. The latest heavy bombers have a maximum speed of 220 m.p.h., while their range is nearly 2,000 miles.

The Russian air force is now the greatest in Europe. Its first-line strength is reported to be over 3,500 machines, and may be as high as 4,000. While nearly three-quarters of the total are believed to consist of fighters and general purpose machines, it includes at least 400 large bombers of long radius—of which, because of her geographical distances, she has made a special point. The strength of the Russian air force, together with its striking range, forms the ground on which Hitler is claiming to go beyond the level of parity with the air forces of his Western neighbours. Another feature which Russia, like Italy, has developed, is the employment of swarms of machines designed for the attack upon ground targets, in conjunction with the army. As seen in the Spanish Civil War, the performance of the Russian machines, both bombers and fighters, has exceeded expectations as much as that of the German has fallen short. Further, she has made better progress than many people imagined possible in training the mechanics and creating the ground organization on which the effective operation of an air force depends.

In 1936 the first-line strength of the Japanese air forces was reputed to consist of about 860 machines, and of these more than half were allotted to the navy. They were not of very modern types, and a significant feature was the small proportion of bombing machines. Since then there has been considerable development, especially in providing more bombing machines, which are now believed to constitute more than a third of the total, while their range has been increased to over 1,000 miles. The first-line strength may be approaching 1,400 machines, of which the naval air arm probably accounts for nearly 800, while that of the army is likely to see a further expansion.

The air forces of the world show marked differences in organization, which affect their development and methods of employment. There are two main types—those which have a separate administration and an independent command, and those which form an integral part of the army and navy. The British has been the most long-standing example of the first type, the Italian following its example in 1923 after Mussolini had come into power. France has more recently, and by degrees, conformed to the British model in the organization of her air forces, which are administered by the Air Ministry, and in general are under the operational control of the General Staff of the Air Forces. But in France, as in Britain, aircraft, carried on board ship “form an integral part of the naval forces,” while “naval co-operation aircraft not carried on board ship are at the disposal of the Minister of Marine.” In Germany there is an Air Ministry which is a part of the Reichswehr Ministry; and the Military air force, in common with the remainder of the armed forces, is under the command of the Reich Minister of War as Commander-in-Chief. The U.S.S.R., on the other hand, has her air force as a part of her army; and Japan, like the U.S.A., has her Military Aviation under the War Office and her Naval air force as a part of her navy. The lesser Powers have, generally speaking, not created a separate Air Ministry or an independent Air Command. Thus it may be said that the Great Powers are

fairly equally divided in the type of control which they have adopted, while the smaller Powers, with an occasional exception, such as Sweden, have incorporated their air forces in the previously existing services. (See also *ARMIES OF THE WORLD: Aero-planes and Tanks*; *WARFARE*; *MUNITIONS OF WAR: Aircraft*.)

(B. H. L. H.)

**Air Mail:** see *POST OFFICE*.

**Airports.** While airport construction began during the World War, it was not given serious attention until a few years later, when civilian flying was found to be greatly hampered by inadequate landing facilities. Because of the great cost of landing fields, their creation soon became a Government function and airport construction was thus undertaken in various parts of the world. In present usage "airport" is applied only to a flying field which has been graded, drained and provided with the necessary buildings and facilities for housing and handling aircraft. "Flying field" is now applied to the portion of an airport which is used for taking off and landing and to unimproved areas which are used for flying operations. "Emergency field" is used to designate an area (generally small and having no buildings of consequence) which is maintained for emergencies. Where regular service is operated it has become common practice to provide emergency fields along the route—which thus becomes an "airway." This began soon after the first regular services and has reached its highest development in the United States, where the Department of Commerce has under its direction over 22,000 miles of airways equipped with lights or radio beacons or both. This great system links together 1,193 municipal and commercial airports and includes 289 Government-controlled emergency fields, of which total 643 are equipped for night flying. Airway marking began with light beacons but foggy weather caused visibility troubles and inspired the development of radio beacons, which now form the main reliance of most airways. The American Municipal Association reported, in 1937, that 738 cities in the U.S. had constructed airports at a total cost of more than \$300,000,000.

In this work the U.S. Works Progress Administration rendered valuable aid, and by November 1937 its expenditures for airports and airways had exceeded \$70,000,000.

Current practice aims to provide airports which can be used regardless of wind direction but accepts as tolerable those providing four landing and take-off directions if these are distributed well around the points of the compass. Anything less is considered insufficient and provision for at least eight-way take-off and landing is expected in a first class airport. Grass sod was originally used for the flying field areas but the growth of traffic is steadily forcing the substitution of hard surfacing for the portions most used. These areas are called "runways" and the paving of runways with macadam, asphalt, concrete, or similar materials, has produced the distinctive pattern of crossed strips which now marks an airport as seen from the air. Airports and their runways vary greatly in size, being governed by many conditions such as the surroundings and altitude as well as by the volume and kind of traffic. So far as one may generalize, a first class airport should have an area of 300 to 400 acres or more; it should have runways at least 3,500 feet long and one of them should be as close as possible to 5,000 feet in length. With the coming of larger and more heavily loaded aeroplanes the tendency is toward further increase in area and several airports already have runways well over 4,000 feet long.

**Plan.**—The arrangement most generally accepted for airports is that of grouping all buildings at one side of the plot in order that the other sides be free of obstructions. However, the plots

vary so much in shape that each airport takes on its own individual characteristics and it becomes impracticable to call any one "typical." It is equally difficult to point to specific airports as "best" or "biggest," because of the constant improvement and the divergent conditions. Taking area as one criterion, the Municipal Airport of Cleveland, Ohio, ranks as largest with its total of 1,040 acres. The most centrally located airport (with respect to a large city) is undoubtedly Tempelhof, Berlin's main airport, which is well within the city and on a subway line. The Municipal Airport of Newark, N. J., handles the greatest volume of traffic, averaging a total of 265 landings and take-offs daily, 130 of these being movements of big airliners. The Municipal Airport of Chicago, Ill., ranks second and follows closely upon Newark in traffic volume. Increasing volume of traffic forced the development of airport traffic control systems, of which the Newark installation is probably the outstanding example. Experiments in traffic control began almost twenty years ago (using signal lights), but only within the past few years has there been any need of a practical system. Even yet, this need exists only at the busiest airports. The radio telephone is now used, although signal lights are also provided for directing aeroplanes which have no radio equipment. A glass-enclosed tower is usually provided, on top of one of the buildings, to give the traffic controller a full view of the airport and its surroundings. Here are located landing light switches, signal lights, telephones and radio for communication with pilots of approaching aircraft or those on the surface and about to take off.

Using methods like those of a train dispatcher, the traffic controller directs the movements of all aircraft in the vicinity—whether in the air or on the ground.

**Safety.**—As airway traffic increased, it brought a pressing need for some method of control to avoid collisions, particularly during conditions of poor visibility. The method now in use depends upon radio communication with the pilots; airliners operating over important routes maintain regular communication with control stations along their routes. Through radio telephony the pilots are informed of weather changes, the proximity of other aircraft and similar information. Flying along an airway each aeroplane is expected to maintain a pre-arranged altitude and to fly somewhat to the right of the centre of the airway as indicated by the signals emanating from its radio beacons. These beacons emit two signals which merge into a steady hum when the aeroplane is on the course, because it thus receives both signals with equal intensity.

Divergence to either side causes that signal to come in stronger than the other, thus informing the pilot when he is off his course as well as indicating the side to which he has drifted. Radio transmission has also been used for effecting "blind" landings of aeroplanes in Europe and the United States. This method depends upon the reception of special local signals which are picked up when approaching the airport. These signals keep the pilot informed of his position and altitude with respect to the runway on which he is to land and make it possible to effect a landing with reasonable safety even in a fog.

Among some of the recent developments of importance there might be noted the construction just completed at Le Bourget, near Paris, and that which is going on at Tempelhof. Gatwick, a new airport constructed to serve London, is also of interest because it can be reached in less time than Croydon despite the fact of its being much farther out. Perhaps the most daring of recent airport developments is the chain of facilities dotting the Pacific ocean to provide bases for one of the routes of the Pan American Airways System. This company utilizes airport facilities at 167 "ports of call"; including other airports and special emergency facilities it has more than 300 bases in all. The Pacific chain in-

cludes many unusual airports, one being the Wake island base which had to be constructed on a tiny and formerly uninhabited island over 1,000 miles from the nearest other land in the Pacific. Despite the difficulties surrounding such construction, less than six months elapsed between inception and actual completion of the entire Pacific chain.

C.

(A. Bl.)

**Air Races.** Italian fliers won the Istres-Damascus-Paris air race, reaching Le Bourget airport in first, second and third places, thereby winning a total of \$110,000 in cash. The winning plane was flown by Lieut.-Com. Samuele Cupini and Captain Amedeo Paradisi. They covered the 3,800-mile route in 17 hours, 32 minutes, 45.2 seconds, an average of 219m.p.h. Frank W. Fuller of San Francisco, Calif., captured the Bendix transcontinental air race, most famous American air derby. Streaking through the air at 265 miles an hour, Fuller flew from Burbank, Calif., to Cleveland, O., in a twin wasp 1,200-horsepower-motored Seversky.

Rudy A. Kling of Lemont, Ill., won the Thompson Trophy, chief event of the National Air Races, held at Cleveland, Ohio. He averaged a speed of 256.9 miles an hour in his Folkert Speed King during the 20-mile grind. Kling was killed in an air crash at Miami, Fla., on Dec. 3.

The projected New York to Paris air race to commemorate the tenth anniversary of the transoceanic flight of Colonel Charles A. Lindbergh was banned by the United States Bureau of Air Commerce as unnecessarily hazardous.

RUDY KLING, garage mechanic, and wife, with famous Greve, Thompson and Henderson trophies Kling won in U.S. aviation's greatest annual speed contest September 2-6, 1937, at Cleveland, Ohio

**Alabama,** one of the "deep South" States of the United States, popularly known as the "Cotton State"; area, 52,250 sq.mi.; population (U.S. census, 1930) 2,646,248; estimated July 1, 1937, at 2,895,000. Capital, Montgomery, 66,079. Cities with larger population are Birmingham, 259,678, estimated Jan. 1, 1938, 300,000, and Mobile, 68,202. Of the State's population 744,278 were urban (1930), or 28.1%; 1,700,775 whites; 944,834 coloured; 2,630,370 native born; 15,878 foreign born.

BIBB GRAVES, governor of Alabama 1927-31, again elected for 1935-39 term

**History.**—The most striking fact in the State's economic history in recent years has been the rise of manufacturing and transportation development. In politics the

Democratic Party has dominated. The Republican Party has persisted, but has exerted little influence in State politics. Alabama has had five constitutions, those of 1819, 1865, 1868, 1875, and 1901. The constitution of 1901 contained notable innovations: the term of executive and legislative officials was extended from two to four years and executive officers cannot succeed themselves.

Many amendments have been adopted since, most important of which are those providing for a local school tax, a State budget, income tax, and the issuance of bonds for State highway construction. The most notable laws pertain to education, regulation of public utilities, taxation, conservation, labour, convicts, social welfare, elections, public health, and the liquor traffic. In 1937 the Prohibition system, in vogue since 1915, was abolished and the system of local option by counties was adopted. Twenty-four of the 67 counties now permit the sale of hard liquors. The traffic is under the control of the State board.

Chief officers of the State are: governor, Bibb Graves; lieutenant-governor, Thomas Knight (deceased); attorney-general, A. A. Carmichael; State auditor, C. E. McCall; secretary of State, Howell Turner; State treasurer, John Brandown; superintendent of education, A. H. Collins; and commissioner of agricultural industries, R. J. Goode.

**Education.**—A well defined system of elementary and high schools and colleges for both races is maintained. Elementary education is free between the ages of 6 and 21, and compulsory between the ages of 8 and 16. State appropriations in 1937 amounted to \$12,070,660. Total revenues from all sources were approximately \$18,762,920, which was \$4,495,000 less than in 1927-30. Illiteracy among whites above 10 years of age was 4.8% in 1930, coloured 14.9%. There are seven State-supported institutions of higher education for whites and three for negroes. Several colleges are maintained by the Methodists, Baptists, and Catholics.

**Charities and Correction.**—The State supports many philanthropic and penal institutions: institutions for the deaf and blind of both races; hospitals for the insane of both races; a school for feeble-minded children; training schools for wayward white boys and girls; and a reformatory school for negro boys; a child welfare department; juvenile courts; a model State prison and a penitentiary system in which the State provides employment for its convicts. Local Governments, churches, clubs, fraternal orders, and industries maintain charities and child welfare agencies.

**Banking and Finance.**—In 1936 there were 69 national banks with a capital of \$20,625,000, deposits of \$179,786,000 and total resources of \$294,577,000; 148 State banks with a capital of \$8,535,000, deposits of \$63,174,000, and total resources of \$82,221,000. Revenue sources include a property tax, income tax, sales tax, privilege taxes, and levies on gasoline, tobacco, beer, and liquor. Receipts and expenditures for the fiscal year ending Sept. 30, 1937, exceeded \$50,000,000, while the State debt stood at \$71,020,000.

ALABAMA: Composition of population

**Agriculture, Manufactures and Mineral Production.**—Alabama ranked second among the cotton-planting States in 1860. Today many crops are produced in large quantities, but cotton is still the most important one. The State ranked fourth among the cotton States in 1937 with an estimated output of 1,610,000 bales. In 1935 there were 273,455 farms covering 19,660,828 ac. with lands and buildings valued at \$368,219,654.

In 1929 there were 2,848 establishments hiring 119,559 workers and producing goods valued at \$560,378,132. In 1937 there were 1,781 establishments, but industrial payrolls and employment almost reached 1929 levels. Twenty-five industries were established with an invested capital of about \$50,000,000. The two great basic industries are cotton textiles and iron and steel. Other important industries are lumber, blast-furnace products, cast-iron pipes and fittings, cotton-seed oil and meal, coke-oven products, cement, and electric power. The manufacture of electricity is one of the State's most important industries. The capacity of the generating plants of the Alabama Power Company is about 900,000 h.p., and the T.V.A. plants in the State are capable of producing almost as much. The mineral output of the State was valued at \$31,772,042 in 1935. Coal and iron ore are the leading mineral products. (A. B. Mo.)

**Alaska.** The year 1937 marked definite progress in the development of Alaska. A resolution introduced by Delegate Anthony J. Dimond of Alaska and adopted by the first session of the Seventy-Fifth Congress provided for the study of Alaska's resources and recommendations for a long range program of development. This study was entrusted to the National Resources committee, assisted by experts in every field of Federal activity in Alaska. It was completed at the close of the year for presentation to Congress.

A new and important step in the development of Alaska for tourists and the capitalizing of its uniquely beautiful scenery was taken in the construction by the Government of a hotel in Mt. McKinley National Park, second largest and northernmost of American national parks. The erection of this hotel at a cost of \$350,000, to be completed in the summer of 1938, marks only the beginning of a park development program. Some 85 miles of road in the park have been completed and three more roads are under construction. Ten airports are under construction, bringing the total number of landing fields to 98. The number of tourists visiting Alaska rose from a total of 63,208 in the previous year to 72,734. The government-owned Alaska railroad, extending from Seward to Fairbanks and the avenue of transportation for passengers to the park, for the second time in its history showed an excess of revenues over operating expenses. It received an allotment of funds for the replacement of the wooden bridge over the Knik river with a steel bridge, the beginning of a program to replace wooden structures with steel and concrete structures.

Alaska's chief products are fish, metals and furs. The year 1936 had shown the largest production in fish, with a total of 524,042,666 pounds with a value of \$50,455,272. This value was exceeded slightly in the years 1928 and 1929, but otherwise was the highest on record. The number employed in this industry also reached the figure of 30,383 in 1936, the highest on record with the exception of the war year 1918 when it reached the all-time high of 31,213, and 1928 when it reached 31,086. The salmon pack was the largest in history, with a total of 8,437,603 cases (48 one-pound cans to the case).

Alaska mined \$23,694,000 worth of minerals in 1936 as compared with \$18,312,000 the previous year. Lode gold rose from \$6,237,000 in 1935 to \$7,105,000 in 1936 and placer gold from \$9,728,000 to \$11,328,000. Receipts from sealskins were \$251,112. Under a wise conservation policy, the sealskin herd has grown steadily from 132,279 in 1910 to 1,839,119 in 1937. The value of other furs shipped from the territory, consisting chiefly of mink, beaver, blue fox, white fox, silver fox, red fox, marten, ermine, etc., increased \$516,856 in 1936 to a total value of \$1,932,894.

Public works projects completed in 1937 included the dredging and deepening of Sitka harbour, to provide a channel 22ft. deep and 159ft. wide; the deepening of Petersburg harbour and the dredging of a fishing boat basin; five schools and three municipal buildings, five municipal improvement projects, including sewer and water systems.

The legislature in its extra session early in 1937 created a department of public welfare to take advantage of the provisions of the Federal Social Security Act. Under it, approximately 580 persons are receiving old-age assistance. (E. GRU.)

**Albania.** A kingdom on the west coast of the Balkan peninsula, lying between Greece and Yugoslavia. Capital, Tirana. Albania is governed by a king, Zog I, created 1928, with a cabinet and single house of parliament. Flag, black double-headed eagle on red ground.

**Area and Population.**—Area, approximately 11,000 square miles. Population (1930 census), 1,003,100; 71% Moslem, 19% Albanian Orthodox, 10% Roman Catholic. Language, Albanian of Indo-European origin; two principal dialects, Geg, northern, and Tosk, southern. Public education is administered by the State; elementary education compulsory from age of seven for five years where schools exist. Number of schools: elementary and kindergarten, 615; secondary, 18, including 5 for girls, 1 co-educational, and 5 professional.

**History.**—The cabinet of M. Kotta, formed Nov. 1936, continued in office; parliamentary elections were held in January. At the request of the Moslem community, the veil for women was made illegal, also the fez with European dress. On Nov. 28 was celebrated the 25th anniversary of independence. Count Ciano of Italy visited Tirana in April to give assurances that the Italo-Yugoslav accord of March was not directed against Albania's independence. An agreement was made with Greece for the exchange of outlaws. The independence of the Albanian Orthodox Church was finally recognized by the patriarchate of Istanbul.

**Trade and Finance.**—The main industries are agriculture and pastoral. In 1937 the State Agrarian Bank was opened, agricultural agents appointed for the instruction of farmers, and corps of forest guards and veterinary police formed. Total exports (1936) were £482,767 and imports £1,089,460, principal exports being cheese, hides, crude oil, wool, eggs, and livestock; and imports textiles, cereals, gasoline and kerosene, machinery, and sugar.

The currency is the gold franc; current rate 15.40=£1. Currency notes and coinage are issued by the National Bank of Albania. Budget figures, 1937-38, were: income £1,706,155, ex-

penditure £1,705,506. Principal direct taxes are on property, income, profits, cattle, and tithe on crops; indirect taxes are on imports, alcohol, and tobacco.

**Defence Forces.**—Compulsory military service of 18 months is in force, with pre-military training from age of 15. The strength of the army is approximately 13,000. There is no navy or air force. Internal order is secured by a gendarmerie of 3,600.

**BIBLIOGRAPHY.**—Ronald Matthews, *Sons of the Eagle* (1937); J. Swire, *King Zog's Albania* (1937). (D. R. O. H.)

**Alberta**, the most westerly of the three prairie provinces of Canada, was created a province by Act of the Dominion Parliament, Sept. 1, 1905. The province has a total area of 255,285 sq.mi. and a population of 772,000 (estimate, Dominion Bureau of Statistics, 1936). The seat of government is Edmonton. The present Social Credit Government has been in office since Sept. 3, 1935.

Preliminary estimate by the Dominion Department of Agriculture places the gross farm value of field crops for 1937 at \$129,632,000, as against \$104,523,000 in 1936. Other branches of production maintained a consistent level. The oil fields of the Turner valley produced 852,829bbl. of naphtha and 1,864,472bbl. of crude oil as compared with 1,048,671bbl. of naphtha and 238,567bbl. of crude oil in 1936. A reduction of the railway rate on crude oil in August 1926 from 75.6¢ to 52.2¢ per barrel between Calgary and Regina, Saskatchewan, aided the industry.

The budget, presented in March, showed a deficit of \$1,125,000 and a total debt of \$159,000,000. Alberta bonds in default amount to \$6,100,000. Political events during the year were significant. On Feb. 19 the Alberta Supreme Court ruled unconstitutional the Reduction and Settlement of Debts Act, a measure passed by the legislature in 1936 to reduce the principal and interest on private debts. Substitute legislation was then introduced which was also declared unconstitutional by the Alberta Court of Appeal on April 4.

On April 7 the Government officially announced the abandonment of the scrip money experiment begun the previous year.

At the first special session of the legislature in August a bill was passed to regulate and license banking. This was disallowed by the Dominion Government on the grounds that the Act infringed on Federal rights. A second special session was called on Sept. 24. Three acts passed dealing with banking, debts, and the press were reserved for assent and reference to the Federal Government by J. C. Bowen, lieutenant-governor; Mr. Aberhart, (*q.v.*) premier of the province, challenged the power of the Federal Government to disallow any provincial act. The question has been placed before the Supreme Court of Canada. (*See also* SOCIAL CREDIT.) (J. T. C.)

**Alcoholic Intoxication:** *see* INTOXICATION, ALCOHOLIC.

**Aldrich, Richard** (1863–1937), American music critic, who wrote for *The New York Times* for twenty-two years and prepared many scholarly volumes on musical subjects. He died in Rome, June 2, 1937. A short sketch of his life appears in the *Encyclopaedia Britannica*, Vol. 1, p. 552.

**Alexandretta, Sanjak of.** One of the first results of the Franco-Syrian treaty of 1936 was to revive Turkey's claims to the Sanjak of Alexandretta. This strange district contains a large Turkish minority, the population of 220,000, consisting of 85,000 (or 39%) Turks, 62,000 Alouites, 22,500 Sunnite Arabs, 49,000 Christians, including 25,000 Armenians, 5,000 Kurds, 1,000 Circassians, 500 Jews, and 900 mixed. The Ankara Government objected on principle

to men of Turkish race being placed in subjection to Arab authority, and insisted upon the independence of the Sanjak, reserving to themselves the right to annex the territory to the national state later on. France could not contemplate lending her assistance to Pan-Arab ambitions by forcibly opposing Ankara's claim, but aimed at conciliation and pacification, and through her the dispute was brought before the Council of the League of Nations. The Council first demanded an inquiry, and sent three neutral observers into the Sanjak. After an examination of their report and several exchanges of views, the Council achieved the conclusion of a Franco-Turkish agreement (May 29, 1937). It consists of: (1) A treaty guaranteeing the territorial integrity of the Sanjak. (2) Agreement guaranteeing the frontier between Turkey and Syria.

In June 1937, the Council of the League of Nations promulgated a statute which stipulates that the Sanjak should henceforth enjoy full independence in the conduct of its internal affairs. The Council of the League of Nations attributes to itself a power of control exercised through a permanent delegate of French nationality. (R. PIN.)

**Alfalfa.** Recent winter killing and cumulative effects of previous droughts contributed to a smaller acreage of alfalfa in the United States in 1937, but higher yields per acre produced a larger crop, 27,056,000 tons of hay, as compared to 24,881,000 tons in 1936 and a five-year (1928–32) average of 23,544,000 tons, the U.S. Department of Agriculture estimated. In Canada the 1937 crop was 1,966,000 tons, compared to 2,298,000 tons in 1936, the Ministry of Trade and Commerce estimated. Production was divided among the provinces as follows, figures in parentheses being for 1936: Ontario, 1,519,000 tons (1,824,000). Alberta, 166,000 tons (183,000). British Columbia, 163,000 tons (158,000). Manitoba, 56,000 tons (68,000). Quebec, 36,000 tons (36,700). Saskatchewan, 26,000 tons (29,000).

Production of alfalfa seed in the United States shifted to the Western States because of a sharp decline in the North Central States, which produced only 369,700bu. of seed in 1937, compared to 525,700bu. in 1936. Production for the entire country was 943,000bu., slightly higher than the 1936 crop and about 8% larger than the five-year average. Declines in alfalfa acreage in the United States have been followed by increased planting of lespedeza and cowpeas for hay. The lespedeza seed crop of 1937 was the largest ever harvested in the United States, 99,165,000lbs., which was 60,801,000lbs. larger than the small 1936 crop. Alsike and red clover made a crop of only 781,000bu. in the United States in 1937, compared to 1,172,000bu. in 1936. Timothy seed production in 1937 was 2,349,700bu. and only 926,800bu. in 1936; sweet clover, 954,100bu. in 1937 and 770,000bu. in 1936. (S. O. R.)

**Algae:** *see* BOTANY: *Algae*.

**Algeria**, a North African country forming an integral part of France, under a governor-general. It is divided into the departments of Algiers, Oran, and Constantine, and covers an area of about 222,120 sq.mi. between long. 4°36'W. and 6°16'E., and lat. 37°6'N. to about 30° N. Population (1936), 7,234,684 (987,252 Europeans).

**History.**—The Arab nationalist movement was active in 1937 throughout French North Africa, and its agents are working for an Islamic revival and receive particular attention among the *ulemas*, whose leader in Algiers is M. Ben-Badis.

The coming into power of the Front Populaire was the cause of widespread disturbances. This party included among its members the very men who had encouraged the most daring demands of the

natives. The unrest did not spread beyond the towns and was chiefly attributable to small groups of young men. How high feeling ran had been demonstrated on Aug. 2, 1936, with the assassination of the Mufti of Algiers, whom the *ulemas* reproached for his devotion to France. A delegation of *ulemas* visited Paris in October and brought back vague promises from M. Léon Blum. The *ulemas* and the reformers were soon surpassed by the extremists, whom the governor-general, Le Beau, had to suppress firmly.

The Viollette proposal to grant electoral rights to certain categories of natives was discussed passionately; but the native leaders wanted to acquire French electoral rights while retaining their personal status as Moslems, so the project came to nothing. By a decree of Feb. 26, 1937, the anti-French association *l'Étoile Nord-Africaine* was at last dissolved, but revolutionary propaganda showed no signs of abating. Riots occurred in many places (as at the factories at Kouif, on Mar. 9). The 1937 budget amounted to 1,590 million francs. Trade for 1936 was valued at 5,612 million francs, surpassing the figure for 1935 by 155 million francs. Imports, 3,078 million francs; exports, 2,534 millions.

**Allergy.** In studying the causes of allergy it has been found that allergic symptoms are not related to the calcium or potassium level of the blood (Hathaway, Rappaport, Reed, Struck); that sugar tolerance is normal in allergy (Wagner, Rackemann, Duffy); and that a guinea-pig may be sensitized to simple chemical substances (Landsteiner). Habitual hyperthermia or fever may be due to food allergy (Gay). Essential hypertension is aggravated in some cases by food allergy (Vaughan and Sullivan). Thrombocytopenia or lessened platelets in the blood may result from foods and amidopyrine (Squier). Sensitization to mosquito bites may appear with severe symptoms, and apparently successful immunization against the reaction is possible (Benson). The danger from swimming for persons sensitive to cold is a serious problem (Horton, Brown, Roth). Other conditions which may be allergic are oedema and haemorrhage of the retina (Bedell); detachment of the retina (Prewitt, Balyeat); blurring of vision and oedema of the macula (Plumer); and conjunctivitis and recurrent iritis (Woods).

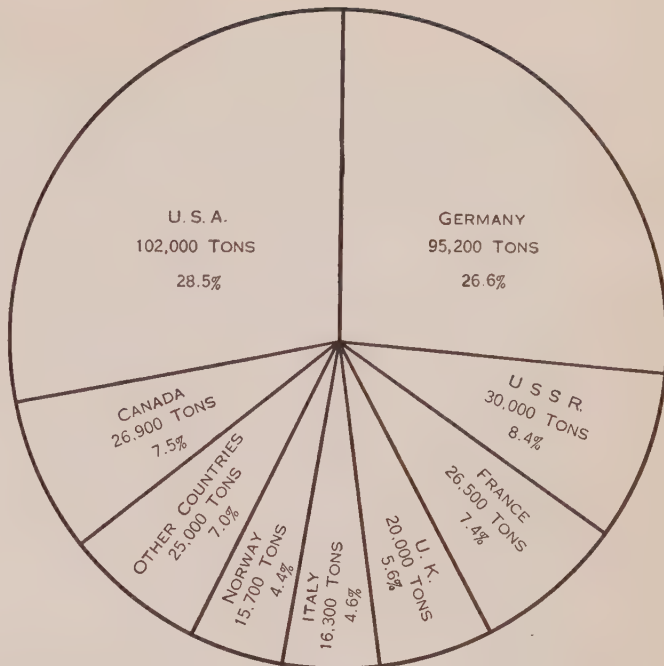

In the diagnosis of allergy, increase in blood eosinophilia and decrease in peripheral white blood-cells following ingestion of offending food is significant (Madison and Squier).

Studies of treatment have shown that treatment by oral pollen administration for hay fever is not successful (Bernstein and Kirsner). In asthma, severe cases may be relieved by ether anaesthesia (Kahn), and by tribromethanol anaesthesia (Fuchs). A few cases were helped by adrenal cortical hormone (Wilmer and Miller). In eczema, certain types were relieved by Vitamin C (White). (B. Z. R.)

**Alloys:** see ARCHITECTURE: *Materials*; CHROMITE; MAGNESIUM; MOLYBDENUM; NICKEL; TITANIUM; VANADIUM.

**Aluminium or Aluminum.** The most important developments of recent years in connection with aluminium all centre around the problem of meeting the larger demand as the metal has been adopted for a rapidly growing list of new uses, resulting in the opening up of new ore deposits (see BAUXITE), the expansion of output by old producers, and the establishment of considerable new production.

Marked changes are seen, not only in the magnitude of the output, but also in its distribution. The normal trend of expansion has been altered by the world war, industrial depressions, and the rearmament activities and nationalistic self-sufficiency pro-

WORLD PRODUCTION OF ALUMINIUM in 1936: total 357,600 metric tons

grams that have been inaugurated in several countries, with a corresponding shift in sources of output and trade flow across international boundaries. There have been marked increases in the outputs of Germany and Italy, and six new countries have been added to the producer's list—Spain in 1929, the Soviet Union in 1932, Japan and Sweden in 1934, Hungary in 1935, and Yugoslavia in 1937; besides this, plans are under way for the construction of plants in Australia and Czechoslovakia, and for increases in plant capacity in Italy, Japan and the United Kingdom.

The lightness of aluminium has always been a determining factor in its adoption for new uses, and much of the recent expansion in demand has been due to extensive application for the specific purpose of lightening the weight of all types of transportation equipment; to reduce the dead load and increase the pay load; examples of this are found in the new stream-lined passenger trains, freight cars, aircraft, truck bodies, mine cages, steam shovel dippers, bridge floors, and even the lowly wheelbarrow, to mention only a few. Technologically, one of the most striking of the recent developments is the commercial application of a new process for the coating of steel with aluminium, giving a product with the strength of steel and the high corrosion resistance characteristic of aluminium. (G. A. Ro.)

**Ambassadors and Envoys.** The following is a list of Ambassadors to and from the United States and to and from Great Britain:

### To and From the United States

(\* = ambassadors; unstarred, envoys.)

To the United States	Country	From the United States

## American Academy of Arts

and Letters was organized in 1904 by the National Institute of Arts and Letters, a body which was organized in 1898 by the American Social Science Association. The method of organizing the academy was as follows: Seven men were chosen by secret balloting of Institute members: William Dean Howells, Augustus Saint-Gaudens, Edmund Clarence Stedman, John LaFarge, Samuel Langhorne Clemens, John Hay and Edward MacDowell. These seven chose eight other members and this group of fifteen then elected fifteen more to complete the organization. In 1908 its membership was extended to fifty. In 1915 the academy received from a then anonymous donor the lots upon which its buildings now stand and a substantial sum of money. In 1921 it received from the same donor and his mother the funds with which it erected its Administration building, and in 1928 from the same donor the funds with which it erected the building containing its auditorium and art gallery.

The academy has steadily increased its influence by adhering to high standards in its various educational efforts: in the publication of its Proceedings and volumes of Commemorative Tributes to deceased members, and in the giving of four medals for Good Diction on the Stage, Good Diction over the Radio, Excellence in the Writing of American Fiction and for Distinguished Creative Work in Literature, Art or Music.

Since its organization the academy has had but three presidents and two secretaries. The presidents were William Dean Howells, 1908–1920, William Milligan Sloane, 1920–1928, and Nicholas Murray Butler, elected in 1929; the secretaries, Robert Underwood Johnson whose death occurred Oct. 14, 1937, and the present secretary, William Lyon Phelps. Wilbur L. Cross is (1937) the chancellor and treasurer. The following men were elected to membership at the Nov. 1937, meeting: Charles McLean Andrews, Bernard Berenson, Van Wyck Brooks, Frederick Converse, William A. Delano, Jonas Lie, Herbert Putnam, Albert Spalding, Chauncey B. Tinker, and Charles Warren. (G. D. V.)

## American Academy of Political and

Social Science. During the year 1937, the American Academy of Political and Social Science, which is now nearly fifty years old, continued its regular activities. The academy provides an open forum for the discussion of questions of national and world importance. It carries on its work through its publications and through meetings. On April 16 and 17, 1937, the Forty-First Annual Meeting was held, with the general subject "The United States and World War." Another meeting was held on October 21 on the subject of "American Neutrality in the Far East."

The bi-monthly journal of the academy, known as *The Annals*, devotes each issue to a special topic. The ones appearing in 1937 were entitled "Improved Personnel in Government Service"; "Current Developments in Housing"; "Consumers' Co-operation"; "The United States and World War"; "The Revival of Depressed Industries"; and "The Prospect for Youth." There are also published a monograph series and a series of pamphlets. The most recent of the pamphlets have been "Modernizing Our State Legislatures," by A. E. Buck, and "The Economics of Isolation" by H. R. Burrows and J. K. Horsefield. (E. M. P.)

## American Association for the Advancement of Science.

During the calendar year 1937 the American Association for the Advancement of Science held two meetings, a summer meeting in Denver, Colo., from June 21 to 26, and its annual meeting in Indianapolis, Ind., from Dec. 27, 1937, to Jan. 1, 1938. At the Denver meeting 575 scientific papers were presented, including a general address by Professor Nevil V. Sidgwick, F.R.S., of Oxford, England. At the Indianapolis meeting nearly 1,300 scientific papers were presented before 225 different sessions of the sections of the association and its affiliated societies. Both meetings of the association in 1937 were distinguished by symposia on subjects of broad scientific and national interest. Among these symposia were those on "The Scientific Aspects of the Control of Drifting Soils," "Tuberculosis and Leprosy—Diseases Caused by Acid-Fast Bacilli," "Science and Society—Fundamental Resources as Affected by Science," "The Applications of Surface Chemistry in Biology," and "The Endocrines as Related to Behavior." Symposia are more and more important features of the meetings of the association. At the close of the fiscal year of the association (Sept. 30) its active members numbered 18,303, and the combined membership of its 162 affiliated and associated societies (including duplications) approached a million. (G. D. Br.)

**American Association of University Professors:** see ACADEMIC FREEDOM.

## American Bankers Association.

Dr. Harold Stonier, internationally known for his work in adult education, was elected executive manager of the American Bankers Association. He succeeds Fred N. Shepherd, resigned, who held that office 16 years. Dr. Stonier retains his positions as national educational director for the association and the American Institute of Banking and director of the Graduate School of Banking. Other officers of the association are: president, Orval W. Adams, Salt Lake City, Utah; first vice-president, Philip A. Benson, Brooklyn, N.Y.; second vice-president, Robert M. Hanes, Winston-Salem, N.C.; treasurer, M. H. Malott, Abilene, Kan.; senior deputy manager, Frank W. Simmonds, New York, N.Y.; general counsel, D. J. Needham, Washington, D.C.; secretary, Richard W. Hill, New York, N.Y.; president, national bank division, Russell G. Smith, San Francisco, Calif.; vice-president, H. E. Cook, Bucyrus, Ohio; trust division, president, Robertson Griswold, Baltimore, Md.; vice-president, Samuel C. Waugh, Lincoln, Neb.; State bank division, president, Harry A. Brinkman, Chicago, Ill.; vice-president, H. W. Koeneke, Ponca City, Okla.; savings division, president, Henry S. Sherman, Cleveland, Ohio; vice-president, P. R. Williams, Los Angeles, Calif.; American Institute of Banking section, Frank R. Curda, Chicago, Ill.; vice-president, Milton F. Barlow, Mankato, Minn.; State secretaries section, president, W. Gordon Brown, New York State Bankers Association; first vice-president, C. W. Beer-bower, Virginia Bankers Association; second vice-president, C. C.

Wattam, North Dakota Bankers Association.

## American Bar Association.

The American Bar Association in 1937 began to function under the new Constitution and By-laws adopted at its annual meeting in Boston in Aug. 1936. Its House of Delegates, representative of the American profession, first met at Columbus, Ohio, in Jan. 1937, and again in Kansas City in September, at the time of the annual meeting. Under the new régime, the control in administration in the Association is vested in the House of Delegates, subject only to the rights of the members to hold a referendum on any particular subject.

The outstanding action of the year was taken under the referendum provisions of the Constitution. Following President Roosevelt's announcement on Feb. 5 of his proposal to enlarge the Supreme Court, the board of governors of the Association ordered a referendum to ascertain the views of its members. Subsequently, a second referendum of all of the lawyers in the United States who were not members of the Association was ordered. The vote on the first referendum was six to one against the President's proposal and on the second referendum it was four to one. The Association, through its Special Committee to Oppose the Supreme Court Proposals, laboured to carry out the mandates of the Bar, chiefly by research on behalf of members of the Congress and by conducting meetings at which both sides of the question were debated. (See also SUPREME COURT OF THE UNITED STATES.)

As a result of action taken at the annual meeting at Kansas City, a referendum was taken in November to ascertain the views of its members on the Child Labour problem, with reference to which the position of the Association has frequently been misrepresented in recent years. By a vote of four to one, ratification of the 1924 amendment was opposed, and by a vote of six to one, the Vandenberg amendment, unanimously reported by the Senate Judiciary Committee, was approved, thus definitely answering the unfounded charges against the Association. (See also CHILD LABOUR.)

In addition to the normal work being carried on by 13 sections and 33 committees, special emphasis has been placed, since the Kansas City meeting, on two phases of the activity of the Association: (1) American citizenship, under the leadership of a committee from the Junior Bar Conference, and (2) improvement in the administration of justice through seven Committees of the Section of Judicial Administration: improving pre-trial procedure; methods of selection of juries; improving trial practice; improving the law of evidence; simplification of appellate procedure; control of state administrative agencies; and improving judicial organization and administration. The aim of these committees is to set up definite standards to be reported at the next annual meeting in July 1938. These standards should be as persuasive with the bench and bar of the several States as have been the Standards of Legal Education and the Canons of Professional Ethics of the American Bar Association. (A. T. V.)

## American Bible Society.

The 121st annual meeting of the American Bible Society in 1937 elected John T. Manson of New Haven, Connecticut, president. Gilbert Darlington is treasurer. General secretaries are the Rev. Dr. Eric M. North, in charge of foreign activities, and the Rev. Dr. George W. Brown, in charge of activities in the United States. The Rev. Dr. Francis D. Stifler is editorial and recording secretary. The society now distributes more than 3,500,000 Bibles annually in the United States. In co-operation with the British and Foreign Bible Society and the Scottish Bible Society the Bible has been translated into more than 1,000 languages, and about 30,000,000 Bibles are distributed annually throughout the world. The society's principal office is at Park

avenue and 57th street, New York city, with branch offices in nine cities in the U.S. and representatives in many foreign countries, in co-operation with the British and the Scotch Bible societies. The American Bible Society elects a vice-president from each of the 48 States and among those so chosen are Chief Justice Hughes, John R. Mott, Mrs. Finley J. Shepard, William Lyon Phelps, and General Evangeline Booth.

**American Dental Association:** see DENTISTRY.

**American Economic Association.** Officers of the American Economic Association for 1938, elected at the 50th annual meeting Dec. 1937, in Atlantic City, N.J., are: president, Alvin H. Hansen, Harvard university; vice-presidents, Frederic B. Garver, University of Minnesota; Frederick C. Mills, Columbia university; secretary-treasurer, James W. Bell, Northwestern university; elected members of the executive committee, Robert M. Haig, Columbia university; Harry G. Brown, University of Missouri; Carter Goodrich, Columbia university; Frank D. Graham, Princeton university; Mabel Newcomer, Vassar college; Benjamin M. Anderson, Jr., Chase National Bank, New York city. Davis R. Dewey, Massachusetts Institute of Technology, Cambridge, Mass., is managing editor of the association's quarterly, the *American Economic Review*, considered by economists as one of the most valuable publications of current economic problems and thought. The purpose of the association is to stimulate thought and discussion of current problems from an economic point of view and membership is open to anyone interested, upon endorsement of a member and payment of small, nominal dues.

**American Federation of Labor** was formed at a convention in Columbus, Ohio, in 1881 by a small group of craft union leaders headed by Samuel Gompers, English-born cigarmaker. Gompers was elected president and was re-elected each year except 1893 until he died in 1924.

Samuel Gompers laid down two cardinal principles that the Federation still cherishes: (1) keep the labor movement non-partisan in politics and (2) maintain the Federation as a "ring of sand" around autonomous craft unions. He evolved these principles from the failure of the Knights of Labor, the labor organization that the American Federation of Labor succeeded as keystone of the American labor movement.

The Knights of Labor collapsed after it tried to band all the laboring classes into one large union and attempted independent political action.

The American Federation of Labor in 1920 reported a dues-paying membership of 4,078,740. In 1933 its membership dropped to 2,126,796. On Aug. 31, 1937, the Federation consisted of 100 national and international unions; 1,406 local labor unions in the U.S. and Canada; 49 State federations; and 738 city central bodies,

WILLIAM GREEN, 64, president, American Federation of Labor, elected December 19, 1924

with a membership of 3,271,726. It lost a membership of approximately 1,000,000 in 1936 when it suspended the Committee for Industrial Organization unions, but during the following year the Federation redoubled its organization efforts and regained in new members most of the C.I.O. loss. The president of the American Federation of Labor is William Green, a former coal miner and former official of the United Mine Workers of America.

The Federation has a threefold purpose: (1) to organize unorganized workers; (2) to promote the interests of its members through legislative activity and publicity; and (3) to settle disputes among its members. The Federation's annual autumn convention is its final seat of authority. Between conventions the Federation is governed by an executive council made up of the president, secretary-treasurer, and fifteen vice-presidents. It is financed by a per capita tax on member unions, two cents each month for each member of national and international unions and 35 cents a month for each member of directly affiliated local unions. The financial report of the Federation, beginning Sept. 1, 1936, and ending Aug. 31, 1937, showed that the balance on hand, Aug. 31, 1936, was \$569,405.99; the total receipts for the 12 months ending Aug. 31, 1937, were \$1,184,478.99, and the total expenses for the same period were \$1,167,317.57, leaving a balance on hand, Aug. 31, 1937, of \$586,567.41. (See also LABOUR; LABOUR UNIONS; UNITED STATES: Labour.) (E. F. MCG.)

**American Geographical Society.** In 1937, the American Geographical Society, the oldest geographical institution in the United States, completed its eighty-fifth year. Its library and map collections, the largest of the kind in the Western Hemisphere, contained at the end of the year more than 100,000 volumes of book and periodical publications, about an equal number of maps, and some 1,600 atlases. Three new volumes were added to the Society's notable series: *Polish Countrysides* by Louise A. Boyd, *The Frame of the Ancient Greek Maps* by William A. Heidel, and *The Colorado Delta* by Godfrey Sykes. Work was completed on the 102-sheet map of Hispanic America on the scale of 1:1,000,000 on which the Society has had a large staff of compilers and draughtsmen engaged for the past 16 years. A topographical map of some 5,000 sq.mi. in Northern Labrador was constructed, by a special method developed at the Society, from oblique aerial photographs taken under the Society's direction on the Grenfell-Forbes Labrador Expedition of 1931 and supplementary expeditions carried out by Dr. Alexander Forbes in 1932 and 1935. This method was also employed in constructing a series of maps from photographs taken on the Ellsworth Trans-Antarctic Expedition of 1935, published in the July issue of the *Geographical Review*, the Society's quarterly journal. A member of the Society's Department of Technical Training had charge of the climbing of Shiva's Temple and Wotan's Throne and the provisioning of the scientific parties on the Grand Canyon Expedition of the American Museum of Natural History. (R. R. P.)

**American Historical Association** was incorporated by act of Congress in 1889 "for the promotion of historical studies . . . and for kindred purposes in the interests of American history and of history in America." It has (1938) a membership of about 3,300, chiefly recruited from the teachers and writers of history in American and Canadian schools and colleges. Its national headquarters are located at 740 15th street, N.W., Washington, D.C., but its chief administrative officer, the executive secretary, has offices at 226 South 16th street, Philadelphia, Pa. It is governed by a Council elected at the annual meeting and supported by annual dues (\$5) and by the income of an endowment fund of about \$250,000.

TWO OF THE LEGIONNAIRES from Uniontown, Pa., as they solemnly paraded along 8th Avenue, New York

Its activities are many and their scope is wide. It publishes an important series of American legal records, another important series of material relating to the history of America, and a third series of historical monographs covering the whole field of history. It publishes *The American Historical Review*, the most important historical journal in America. It co-operates with the National Council for the Social Studies in the publication of *Social Education*, which deals with the problem of teaching history in the schools. From time to time it has through special committees made contributions of great importance to the sound study of history in the secondary schools. It has done much to assist in governmental surveys of historical source materials in America, and much to protect historical records and historical monuments from destruction. (C. Rd.)

**American Indians:** see INDIANS, AMERICAN.

**American Institute of Architects.** Efforts to revive building and to further Government housing activities in an effective way have claimed much of the attention of the American Institute of Architects and its 70 local chapters. Officers elected for 1937-38 at the Institute's 69th convention June 1937, in Boston are president, Charles D. Maginnis of Boston; vice-president, Frederick H. Meyer of San Francisco; secretary, Charles T. Ingham of Pittsburgh; treasurer, Edwin Bergstrom. Elections to fellowships in the Institute, announced in 1937, were: California, Harris C. Allen, John Blakewell, Jr., Roland E. Coate, John Reid, Jr.; New York, Edward Shepard Hewitt, Eric Keblon; Baltimore, G. Corner Fenhagen, Laurence Hall Fowler, James R. Edmunds; Philadelphia, Ralph B. Bencker, George Simpson Koyl; Chicago, John W. Root, Hugh M. G. Garden; Pittsburgh, Frederick Bigger; Rhode Island, John Hutchins Cady; Texas, Ralph H. Cameron; Boston, H. Daland Chandler; Wisconsin, Henry A. Foeller; Georgia, Hal Fitzgerald Hentz; Minnesota, Roy Childs Jones; South Carolina, Samuel Lapham, Jr.; Washington, D.C., Louis A. Simon; New Jersey, Seymour Williams.

For the first time in its history the International Congress of Architects will hold a meeting outside Europe and will meet in the city of New York in the autumn of 1939, the journal of the American Institute announces. The Institute's 70th convention will be in New Orleans April 19, 1938. The offices of the Insti-

tute are at 1741 New York avenue, N.W., Washington, D.C.

**American Iron and Steel Institute.** The publication and distribution of books and pamphlets continued to be prominent among the activities undertaken in 1937 by the American Iron and Steel Institute in promoting the interests of members of the iron and steel industry in the United States. Certain publications, such as the statistics of iron and steel production, the account of the general meeting of the Institute and the periodical, *Steel Facts*, represented continuations of series. New publications included the first two sections of a manual covering definitions and descriptions of iron and steel products and a booklet describing the manufacture of steel by means of pictures and brief text. The Institute likewise continued during the year its work of compiling and publishing a series of freight tariffs showing freight rates on iron and steel products from important origin points to principal destinations. Five tariffs have been published, available to all members of the industry, at relatively low cost, a service which only a few of the largest could afford for themselves. Another important activity was the providing of accurate information relative to the industry. Thousands of inquiries from editors, writers, students and the public generally were answered by members of the Institute staff during the course of the year. (W. S. To.)

**American Legion.** The outstanding feature of 1937 for the American Legion, organization of the World War veterans of the United States, was the 19th annual convention held in New York city in mid-September. It was the biggest convention gathering in Legion history and drew 110,000 Legionnaires, wives and children.

The climax of their visit was a parade up Fifth avenue on Sept. 21, which lasted 18 hours and in which over 80,000 marchers and 500 bands participated.

The keynote of the convention was world peace. With advance payment of adjusted service certificates still under way, Legion officers discouraged further demands for aid and denied that the

WITH 110,000 AMERICAN LEGIONNAIRES attending their 19th yearly meeting, it was almost dawn of the second day of marching before the annual parade was finished

group was a pension-seeking organization. Instead they stressed neutrality legislation and requested a large army and navy for defence.

The group's policy of avoiding political issues was evident in the avoidance of a declaration on President Roosevelt's court plan and in a statement of neutrality in labour disputes. As customary also, a strong stand was taken against all principles and bodies considered as subversive of American institutions.

As to decisions regarding matters more closely connected with internal policy, Daniel J. Doherty of Woburn, Mass., was selected to succeed Harry W. Colmery as national commander and Los Angeles was chosen as the 1938 convention city. The 1,342 delegates representing a membership of nearly 1,000,000 staged their most serious revolt when they opposed a uniform contract concluded by their national officials. Otherwise business proceeded smoothly and the convention adjourned with 1,800 members leaving for a pilgrimage to Europe while the rest returned to their homes having spent an estimated \$5,500,000 during their five-day visit. (See also BRITISH LEGION.)

**American Library Association,** the official organization of librarians in the United States and Canada, consists of librarians, library trustees, and others interested in libraries. Founded in 1876, it functions through a headquarters staff of over 65 persons and through 75 voluntary boards and committees. International in character from its beginning, the Association had representatives from every major country in its 1937 membership which numbered over 14,000.

The oldest and largest association of its kind, it is affiliated, formally or informally, with more than fifty other library associations in America and abroad.

One of the chief objectives of the Association is complete and adequate library coverage for the United States and Canada. In 1937 approximately 50 million people in the two countries—most of them in rural areas—were without access to a public library. Other objectives are: "to assist libraries to operate with the utmost economy and efficiency; to improve the status of librarianship; to build for the future of library service by drawing into the profession some of the best qualified young men and women; and to promote studies which will tend to establish on a solid foundation the library's place in the governmental and social structure."

Standards of training for librarians are set by the Association and a free employment service is offered to libraries and individual librarians. The total income for the last fiscal year was more than \$312,000, but less than \$100,000 of it was unrestricted. The Association's endowment is now approximately \$2,194,000.

The Association issues three periodicals: *Bulletin of the American Library Association*, a monthly which includes the annual reports, the conference proceedings, and the yearly handbook; the *Booklist*, published semi-monthly as a guide to the selection and purchase of current books; and the *Subscription Books Bulletin*, a quarterly which presents critical estimates of subscription books and sets sold currently by canvassing agents. In addition, the Association published over 40 other professional books and pamphlets during the year.

At the Midwinter Conference, held in Chicago, Dec. 28–30, 1936, the Council, the policy-forming body of the Association, endorsed the general programs of Government work relief, especially those sponsored and supervised by competent library agencies; advocated the continuance and publication of the Federal Index of American Design, a Federal art project designed to provide pictorial records of thousands of objects that reveal American traditions in the useful and decorative arts; endorsed the Histori-

cal Records Survey, conducted by the Works Progress Administration to make such materials in local town and county records and in State archives and church records accessible to students, scholars, and professional workers; and authorized a series of ten Latin-American library fellowships covering a five-year period— if and when funds are available.

The 59th Annual Conference of the A.L.A., held in New York city, June 21–26, 1937, was attended by over 5,500 persons, the largest attendance in its history. On this occasion the John Newbery medal, awarded annually by the Section for Library Work with Children for the most distinguished children's book written by an American during the year, was presented to Ruth Sawyer for her book, *Roller Skates*. Announcement was also made that a new medal to be called "Randolph Caldecott Medal" will be presented annually to the artist of the most distinguished picture book for children published in the United States during the year. Officers elected for 1937–38 were: Harrison Warwick Craver, New York city, president; Milton James Ferguson, Brooklyn, N.Y., first vice-president and president-elect; Herbert S. Hirschberg, Cleveland, Ohio, second vice-president; and Matthew S. Dudgeon, Milwaukee, Wis., treasurer. Carl H. Milam is executive secretary of the Association, with headquarters at 520 North Michigan avenue, Chicago, Illinois.

The 1937 Midwinter Conference was held in Chicago, Dec. 27–30, and the 60th annual conference will be held in Kansas City, Missouri, June 13–18, 1938. (See also LIBRARIES; for British Association see LIBRARY ASSOCIATION.) (M. O. P.)

**American Literature.** Nineteen thirty-seven was not, so far as can be discerned at the present time, an heroic year in literature. No great new reputations rose flaming above the horizon; no old fames went tumbling into ruins; it seems not to have been a year of "great" books. Yet it was a year in which many good novels were published, an army of autobiographies which, perhaps even more than the novels, revealed the temper of the time, and several other books worthy of attention.

The best-seller lists, from Maine to California, for most of the year, continued to be dominated by two books published in 1936: Margaret Mitchell's romantic story of the South in the Civil War, *Gone With the Wind*, which shattered all sales records of the previous half century, and Dale Carnegie's *How to Win Friends and Influence People*. Neither attracted distinguished attention from the critics. Toward the close of the year Kenneth Roberts' high-spirited story *Northwest Passage* and Hendrik Van Loon's very personal history of *The Arts* took the lead; the critics were kinder to them.

In *The Arts* Mr. Van Loon, who had previously outlined history, and summarized the Bible and geography, undertook a rapid survey of the patterns of human expression—painting, sculpture, architecture, music—produced by "that divine discontent which is not only the beginning of all wisdom but also the beginning and end of all great art," and again gave evidence that he is even more artist than historian. (See PUBLISHING.)

Yet many of the novelists of 1937 evidenced a curious passion to be rather historians than artists. Kenneth Roberts, writing *Northwest Passage*, revealed a strange inferiority complex. He told the rip-roaring story of Major Robert Rogers, who in 1759 led his green-clad rangers from Lake Champlain to sack the Abenaki village of St. Francis in Quebec, and led them—most of them—back through hell and high water to the outermost settlements on the Connecticut river. No more stirring reconstruction of the harsh days of the French and Indian war has ever been made; and the first half of Mr. Roberts' book may well win a kind of permanent semi-adolescent audience such as feasts perennially on

MARGARET MITCHELL, author of *Gone with the Wind*

the works of Cooper and of Dumas. But Mr. Roberts was not content with this: he felt constrained to prove himself not only novelist but historian, and so weakened his book by continuing the anti-climactic story of the real Rogers, who, made governor of Michilimackinac, boozed and gambled his way to a debtor's prison and a liar's after-life.

A limited edition of this book was printed in two volumes, the second containing documents to prove the historic authenticity of the story. Neil Swanson's novel of Western Pennsylvania, *The First Rebel*, was similarly documented. Several other historical novels of the year included bibliographic footnotes to legitimize the tale. Does this indicate a weakening of the creative impulse—novelists were once proud to boast their powers of sheer invention—or a new respect for fact?

**Historical Romance.**—The vogue of the historical romance continued unabated. Those who saw in it a genuine reinvestigation of the backgrounds of American history were confirmed in their view by the success, not only of *Northwest Passage*, but of Esther Forbes's story of Englishmen and Indians when bayberries and sweet fern still grew beneath the pines on Boston's Beacon Hill, *Paradise*; of Phil Stong's lusty epic of old Iowa, *Buckskin Breeches*; of Archie Binns's idyl of the Puget Sound country, *The Laurels Are Cut Down*; of Conrad Richter's singing story of that war of the "nesters" against the cowmen which broke up the ranch empires of New Mexico, *Sea of Grass*; and of Slogum House, Mari Sandoz's lurid picture of cruelty as she knew it, less than half a century ago, on the raw North-west Nebraska frontier. And in J. P. Marquand's *The Late George Apley* the conflicts of generations, races and classes in old Boston were faced, without the literary texture of George Santayana's *Last Puritan*, but with a greater novelist's skill.

**Fiction.**—Perhaps the American novel of the year was John Steinbeck's cruel, compassionate little idyl of homeless men, *Of Mice and Men*. This is the story of "guys that work on ranches, the loneliest guys in the world. They don't belong no place. They make a little stake and then they go into town and blow it in, and the first thing you know, they're poundin' their tail on some other ranch." But Lennie, the strong, dumb boy, never quite believed it. "We gotta future," he used to say. "Some day we're gonna get the jack together and we're gonna have a little house and a couple of acres an' a cow an' some pigs, an' live off the fatta the lan'."

The stark violence of the conclusion of this story offended some readers; it is almost always present in Steinbeck's work, along with the gentle musing sense of pity which gives the violence meaning. *Of Mice and Men* gave evidence of a sense of composite

form not always present in this novelist's work; it brought him also a national fame not attained by *Tortilla Flat* and *Pastures of Heaven*, which still seemed to some critics his best work. It also demonstrated the man's amazing and fecund versatility.

Ernest Hemingway's 1937 novel, *To Have and Have Not*, was variously received. It had been many years in gestation; Hemingway, it was reported, had written and rewritten, cut and re-cut it. And it turned out a curiously uneven and patched piece of work. The story of a Key West rum-runner who lost out, it seemed to begin as a conventional Hemingway hymn in praise of blood; it ended with a hint of a social gospel, which had hardly been established earlier in the tale. After his great war story, *Farewell to Arms*, Hemingway had seemed fearful of real writing: he had escaped in one book to the bull-rings of Spain, in another to an African safari. Many critics felt that he had written himself out; *To Have and Have Not* made them revise their prognostications. Hemingway had at last come home to America; and he was refusing to be the rich playboy of his later stories. A new seriousness had come into his work; and he still commanded the most powerful emotional rhythm in current American prose.

Another middle-aged writer of the "hard-boiled" school, James M. Cain, who had proved an amazing command of the writer's technique in *The Postman Always Rings Twice*, proved again his ability to convey emotion in swift hard prose, in *Serenade*. But the subject matter of *Serenade* suggested that Mr. Cain was content to squander his amazing narrative talent on material of little meaning.

Two American writers who had already proved their mettle wrote remarkable novels on similar themes: Oliver LaFarge, whose *Laughing Boy* won the Pulitzer prize in 1929, in *The Enemy Gods*; and Edwin Corle, author of *Mojave*, in *People on the Earth*. Both novels dealt with the problem of the Navajo boy, trained in white schools, who wants to live with and serve his own desert people. Both catch the tragedy of past miseducation and the romantic hope that an ancient American civilization which has never died may find new vitality in the 20th century.

Louis Bromfield's novel of India, *The Rains Came*, which was perhaps intended as a parable of the crisis of all Western civilization, hardly enhanced his reputation. William Saroyan's fourth volume of short stories, *Little Children*, revealed no new facets of his unique and genuine talent. Frederic Prokosch, whose *The Asiatics* was one of the memorable books of 1935, repeated that curious exercise in passionate nihilism in another eerie novel, *The Seven Who Fled*, but awakened doubts of the range of his talent. One of the books which most strikingly confirmed the promise of an earlier first novel was the work of a Negro novelist, Zora Hurston, whose *Their Eyes Were Watching God* struck a rich, mellow note, telling a salty story of her own race.

**First Novels.**—It is dangerous business to point to first novels. The United States is a land of promising first novelists, just as England is a land of competent craftsmen of little promise. But we have singularly few novelists who maintain their interest, year after year. Among 1937's crop of beginners, these, perhaps, stand out: Clyde Brion Davis, author of *The Anointed*, a witty and original novel of a slightly cracked seaman who was curious about God; William Maxwell, who, in *They Came Like Swallows*, painted an exquisite picture of a mother as seen through her young children's eyes; and Theodore Strauss, the young author of *Night at Hogwallow*, who struck a new note in lynching stories by introducing two white heroes whose fists felt "like the hammer of God" as they fought to stop the blood-crazed mob.

**Biography.**—Easily the outstanding American biography of the year was Marquis James's *Andrew Jackson: Portrait of a President*, and not the least interesting page in that book was a footnote to the bibliography, in which Mr. James expounded his theory that

if people read more fiction than biography, that was chiefly the fault of biographers who did not know how to write.

"A sizable class of readers," he said, "turn to novels for dependable representations of life and character, finding them in greater proportions than in the people of biography. . . . In no biography that comes to mind offhand is there a character so real to me as Huckleberry Finn, Becky Sharp, Tom Jones or George Babbitt." Mr. James himself makes biography read like the liveliest fiction; Andrew Jackson struts and marches through his pages.

Vincent Sheean's *Personal History*, published in 1935, set a style; and a host of his generation, which came of age at the very brink of the World War, have been telling their stories. This was the "lost generation" which sought solace in Paris and on the Riviera; but the 1937 crop all sing the glories of returning to America.

Orrick Johns, Missouri poet, in *Time of Our Lives*; John Gould Fletcher, the imagist poet of Little Rock, Ark., and London, in *Life Is My Song*; Evelyn Scott, novelist born in Clarksville, Tenn., in *Background in Tennessee*—all discover new meaning in their native soil.

Burton Rascoe, of Kentucky, Oklahoma, Chicago and New York, stresses a similar motif in *Before I Forget*; and Thomas Benton, the Missouri painter, after painting his defiant mid-West rooster-creed on the walls of his native State's capitol, put it into words in his roistering autobiography, *An Artist in America*.

A less philosophical, but significant, writer's biography was Henry Harrison Kroll's *I Was a Share-Cropper*. A new segment of America here found its first literary expression, but to many Americans it was more effectively introduced by a remarkable collaboration—*You Have Seen Their Faces*—in which Margaret Bourke-White, with her incomparable camera-art, illustrated the searing picture of share-cropper despair expressed in Erskine Caldwell's prose.

Publication of Catherine Drinker Bowen's *Beloved Friend* revealed in detail one of the strangest and most pathetic love stories in history: the thirteen-year intimacy between the Russian composer, Tschai-kovsky, and Nadejda von Meck, the wealthy widow who, falling in love with Tschai-kovsky's music, supported, consoled and mothered him, wrote him almost daily letters, arranged his daily life but never talked with him face to face.

There were good books in other categories. A unique contribution to the pre-history of China was Herrlee Glessner Creel's *The Birth of China*; a unique picture of present-day China was Carl Crow's picture of the nation as seen through an advertising man's eyes, *Four Hundred Million Customers*. A new kind of nature writing appeared in Clifford Pope's soberly allur-

ing *Snakes Alive*, and still another in Edwin Way Teale's story of backyard researches, *Grassroot Jungles*.

A new step in American attitudes, of no little significance, was taken when the surgeon general, Dr. Thomas Parran, published his frank *Shadow on the Land: Syphilis*; and a new iconoclastic analysis of traditional American symbols found expression in a brilliant and witty book by a Yale law professor, Thurman Arnold's *Folklore of Capitalism*.

It is not an age of great poetry; even Edna St. Vincent Millay's *Conversation at Midnight* did not enhance her great reputation. For despite some lyric lines of a loveliness unmatched by any of her contemporaries, the burden of the conflicting philosophies which Miss Millay sought to express in variant verse was often too heavy a strain for her medium.

Everett Dick's *Sodhouse Frontier* was one of the most original contributions of the year to American history, bringing back to life the beginnings of settlement on the treeless prairies, necessarily a totally different form of life from that familiar in the forested East. Variant points of view on the old South came to light in installments of two large works on early American history: William E. Dodd's *The Old South: Struggles for Democracy*, finding there new patterns of political life, and the third volume of Charles McLean Andrews' *Colonial Period of American History*, which saw in America little but reflections of England's struggles.

But the most original work of American history of the year was, nominally, not original at all. It was Henry Beston's *American Memory*, a tapestry of impressions of America—from John Smith and William Bradford to Dr. Walter Reed and Henry Adams—so skillfully interwoven, so deftly stitched together with Mr. Beston's love of American soil and his awareness of the Indian heritage, that the whole becomes an original work of art.

A new form of depression literature began to filter into print in 1937: the first volumes of the great *American Guide*, the major enterprise of the Federal writers' project of the WPA, began to appear. A few politicians squirmed at the frankness of *Massachusetts* and *Vermont*; but the people of the States were delighted. *Idaho* was the finest of the early State volumes; but the one signed work in the series, Jeremiah Digges's *Cape Cod Pilot: A Loquacious Guide*, was the wonder-child of the project. For with the inspiration of this rare book it seemed possible that other volumes in the ambitious series might climb out of the Baedeker class into national literature.

(L. Gr.)

KENNETH ROBERTS is the author of *Northwest Passage*

JOHN STEINBECK, recently prominent author of the cruel but compassionate novel *Of Mice and Men*

## American Medical Association

during the year 1937 reached a peak membership of 105,400 making it the largest medical group in the world. It completed an inspection and classification of all the medical colleges in the United States and Canada so as to give credit to those meeting modern requirements of medical education. It carried on the program of hospital grading for acceptable interne service; of the 6,189 registered hospitals, to date 723 were approved for general training and 454 for residencies in the specialties. It has continued to check the extravagant claims for new therapeutic measures, and has given its membership prompt and reliable information in regard to new medicinal preparations, foods for which health claims are made and new appliances used in physical therapy. Through its laboratory, it quickly proved the solvent employed to be the poisonous factor in the falsely labelled "elixir of sulphanilamide" which caused over 73 deaths in the United States. A new Council has been created to study the problems of industrial medicine and surgery.

The subject of the "socialization" of medicine and sickness insurance has excited general attention. It is felt that because of the variations in climate, great differences in distribution of population and varied racial admixtures, the problem is more complex in the United States than in other countries. The American Medical Association is making a careful study of present conditions and observing various plans of deferred payments and pro-rating charges under local medical societies to meet present economic conditions. Its House of Delegates definitely pronounced in favour of free choice of physicians and individual responsibility to the patient.

The *Journal of the American Medical Association* with the journals for the various specialties have set a high standard of medical journalism. Through their wide diversity of information they have contributed an important influence on medical progress in the United States. (See also BIRTH CONTROL: *United States*; BRITISH MEDICAL ASSOCIATION.) (J. H. J. U.)

## Ames, Winthrop

(1871-1937), American theatrical producer, first won wide recognition for his presentations of Shakespearean and other classics at the New theatre in New York. After leaving this enterprise in 1911, he continued to produce outstanding plays. In addition to those listed in the *Encyclopaedia Britannica*, Vol. 1, p. 807, his numerous productions included *The Green Goddess* and *Old English*, which established George Arliss as a star, and the successful Kaufman-Connelly fantasy, *Beggar on Horseback*. Born at North Easton, Mass., Nov. 25, 1871, he died in Boston, Mass., Nov. 3, 1937.

## Anaemia.

During 1937 the following advances have been made in our knowledge of anaemia: Further confirmation has been developed of an interaction between a gastric (intrinsic) factor and a food (extrinsic) factor normally preventing the development of pernicious anaemia. Resemblances have been shown between the conditions essential for clinical activity of the gastric factor and a proteolytic agent (not pepsin) acting *in vitro* on casein.

The effect of liver extract in stimulating formation of red blood cells may be exerted by an augmentative action of three chemically distinct accessory factors upon a primary factor. Dogs fed certain deficient diets and aminopyrine or indole develop severe anaemia curable by yeast autolysate or liver extract. Macrocytic

anaemia is produced in pregnant women by a diet deficient in the vitamin B complex.

New evidence is given that the hypophysis probably is essential for normal blood formation. The United States Pharmacopoeia has attempted to define and label the approximate potency of liver and stomach preparations in terms of units. Some evidence is given that considerably more iron is retained following oral administration than can be accounted for by increase in haemoglobin concentration. The importance of growth, blood loss and controlled absorption of iron in the causation of iron deficiency anaemia is emphasized. New light is shed on the mechanism of iron transportation with reports of prompt increases of iron in the plasma following its oral administration. (G. R. M.)

**Anaesthetics:** see MEDICINE: *New Materials and Apparatus*.

## Andaman and Nicobar Islands.

These islands, a province of British India, form the summits of a submarine range connecting Burma and Sumatra. The Andaman group has a land area of 2,508 sq.mi.; and the Nicobar group of 635 square miles. The population of the islands is 29,463. The indigenes are among the most primitive people in the world, and the islands are occupied only for the Indian penal settlement at Port Blair in the Andamans. Transportation for crime has now ceased, and the Andamans are being developed as a free colony.

## Andorra.

Andorra has experienced certain repercussions of events which have taken place in Spain near the territory of Andorra. Economic difficulties have been surmounted, thanks to the road communications between Andorra and France. Safety has been assured by the force of French police which has been in Andorra since Sept. 1936 to protect the Andorrans entrusted to them by the chief of the French State, co-prince of Andorra.

On Oct. 27 and 28 very serious floods ravaged Andorra. With help, both financial and technical, from France, measures were undertaken to restore communications.

## Anglican Communion, The.

Within the communion of the Church of England in the British Isles are:

The Church in Wales, comprising six dioceses with 1,750 churches, 194,085 Easter communicants (a decline of 1,659 on 1936 figures), and 138,286 Sunday school children (a drop of 9,189).

The Church of Ireland, which received by its representative body contributions from voluntary sources during the year amounting to £190,712. The 25th General Synod was held in Dublin in May.

The Episcopal Church of Scotland, with 127,151 permanent members, 60,333 communicants, and 347 clergy. The annual meeting of the representative Church Council (corresponding roughly to the Anglican Church Assembly) was held in April. It has a declared aim in providing a minimum stipend of £300 per annum and a free house for every rector of an incumbency and priest-in-charge of an independent mission, and has reached the point of £284 per annum with house. Diocesan youth conferences were held in Edinburgh and Glasgow.

The jubilee of the Bishopric in Jerusalem was celebrated in June, and in October that of the Chinese and Japanese Churches. The ninth triennial meeting of the General Synod of the Chinese Church was held at Foochow. In Japan, an evangelical campaign

was undertaken throughout the dioceses and mission districts.

In 1937, the Church of England Council of Empire Settlement was dissolved and was succeeded by the Church of England Advisory Council of Empire Settlement, with the Earl of Bessborough as chairman, whilst a £200,000 scheme was put forward for a cathedral at Wellington, the capital of New Zealand. There are now 248 dioceses outside of England, Scotland, Ireland, and Wales, in the Church of England Communion, and, in three dioceses of South India, of 312 clergy, 287 are Indians and 25 Europeans. In Africa two-thirds of the 600 clergy are African. (See also FOREIGN MISSIONS.)

**Angling.** American records for ocean fish caught by sportsmen in 1937, according to *Yachting*, include the following: Tuna, 821lbs., time 4½ hours, caught by John S. Martin of New York off Liverpool, Nova Scotia, and 33lbs. heavier than the previous North American record. Tuna, 759lbs., caught by Mrs. Earl Potter of Brookville, Long Island, and 760lbs., caught by Mrs. William Chisholm of Cleveland, Ohio, both in Nova Scotia waters. Blue marlin, 608lbs., caught by Gilbert Easton; 580 and 508lbs., caught by Hugh Rutherford; 460lbs., caught by Mrs. Michael Lerner, all off Cat Cay and Bimini. Wahoo, 91lbs., caught by Harry J. Tucker off Bermuda, the Atlantic record and five pounds heavier than the previous record of 1911. Curved yellow tuna, 265lbs., caught off Honolulu by James W. Harvey. The world's record rooster fish, 72lbs., is reported to have been caught at Panama.

**Anglo-Egyptian Sudan.** The year 1937 was an interesting one for the Anglo-Egyptian Sudan. The reorganized provincial administration came into force. In lieu of the 13 provinces, into which the country had been divided since the earliest days, there are now only eight provinces, *viz.*: the Northern province, which includes all the country north of Khartoum, previously divided into the Wadi Halfa, Dongola, and Berber provinces; Khartoum; Kassala, which includes the Red sea littoral; Blue Nile, which includes the Ghezira and the old Fung and White Nile provinces (the latter is still a sub-province); Kordofan, with which is joined the Nuba mountains; Darfur; Upper Nile, and the Equatorial province, which includes the old Bahr-el-Ghazal and Mongalla provinces. The absorption of White Nile sub-province with Blue Nile will take place in 1938. Greater efficiency and economy are expected to result from this regrouping.

In accordance with the terms of the Anglo-Egyptian treaty of alliance signed in London on Aug. 26, 1936, which provided that British and Egyptian troops are to be placed at the disposal of the governor-general for the defence of the Sudan (in addition to the Sudan defence force), the 7th battalion of Egyptian infantry was transferred from Egypt to the Sudan, where it arrived on Dec. 29, and was posted to Port Sudan, with two companies in Khartoum.

The governor-general appointed for the first time an Egyptian officer to his personal staff, as military secretary, and an agreement was come to regulating the indebtedness of the Sudan and the mode of settlement to Egypt for advances made for development purposes since the Occupation.

The year was one of peace and prosperity, good rains, and excellent crops. Particularly was it marked by a record cotton crop in the Ghezira, which reached 890,907 kantars, as compared with the previous best of 805,051 kantars. For the first time auctions were held at Port Sudan in addition to Liverpool.

Government finances were good. Revenue up to Dec. 31 amounted to £E.4,769,263, £E.306,954 more than in 1936.

Trade was brisk, and up to Nov. 30 the figures were: imports

£E.5,558,438; exports £E.7,838,723; compared with £E.4,822,977 and £E.5,104,013 respectively in 1936. (A. MN.)

**Angola** (Portuguese West Africa) is a Portuguese colony extending S. from the mouth of the Congo to C. Frio, 18°S. lat., and E. to the Belgian Congo and Northern Rhodesia. The governor-general, Colonel António Lopes Mateus, resides at Luanda. The area is 487,790 sq.mi., and the pop. c. 3,225,000, of whom c. 59,000 are Europeans. The new capital is to be Nova Lisboa.

Lobito bay is an important harbour, taking a share of the trade of Belgian Congo and Northern Rhodesia, for which it is the nearest outlet to the sea. The Benguela railway serves these territories, and Lobito bay is connected by rail via Katanga and Rhodesia with Beira in Portuguese East Africa.

In Jan. 1937 negotiations were said to be in progress between Germany and Portugal with a view to affording the former country opportunities for economic expansion in Angola, including the exploitation of mines and constructional work by German iron and steel and chemical firms.

Imports and exports for 1936 were valued at £1,340,874 and £2,799,141 respectively, and the 1937 budget was estimated to balance at £1,943,950. The unit of currency is the angolar (equivalent to the Portuguese escudo) of 100 centavos. The main part of the revenue is supplied by shipping and railway dues. A scheme is in development for settling colonists on farms of not less than about 1,000 acres. The principal products are sugar, coffee, palm oil, cotton, wheat, and maize; and an unusual African export is dried and preserved fish.

**Animal Fats:** see VEGETABLE OILS AND ANIMAL FATS.

**Annam:** see FRENCH INDO-CHINA.

**Antarctica.** The last decade has been one of notable achievements in our knowledge of Antarctica; vast amounts of new data have been amassed, and only a fraction of the results of the many expeditions that have been in the field has yet been worked up and digested. Therefore, it is only possible here to sketch in roughly the more notable changes in our conceptions of the physical features of Antarctica.

Perhaps the most striking advance has been the discovery of a vast plateau filling the region between King Edward VII land and Graham land and the addition of several sizable mountain groups in this area to the map. Notable among these are the Edsel Ford range (Byrd's first and second expeditions); the Eternity range and the Sentinel range (Ellsworth's flight). The plateau appears to run from King Edward VII land to the Queen Maud range, thus precluding the possibility of a strait's dividing Antarctica into two parts, as hypothesized by some geographers. The tracing of the boundary between this land mass and the Ross Shelf ice has also delimited the eastern shore of the Ross sea.

Another significant geographical achievement has been the demonstration by aerial mapping (Ellsworth) and surface observations (British Graham land expedition) that Graham land, formerly considered an island, is an integral part of the Antarctic continent.

Almost equally striking is the strong indication from aerial pictures (Ellsworth) and the observation of a surface sledging party (British Graham land expedition) that Alexander island is a part of the continent with a large fiord separating it from Graham land.

From the air the Queen Maud mountains were observed to extend several hundred miles farther to the east than previous observation had shown. This new extension received the name Horlick mountains (Byrd's second expedition).

Much new light has also been shed on the geological structure of the continent. A new cross section of the Queen Maud mountains up Thorne glacier has demonstrated the existence here of the so-called Beacon sandstone—coal-bearing sedimentary strata. In this area the ice cap was also found to be overriding the mountains more extensively than in the western part of the range (Byrd's second expedition).

A preliminary geological reconnaissance of the Edsel Ford range indicates that it consists largely of greatly folded metamorphosed sediments intruded by masses of igneous rocks of batholithic proportions. These intrusives are high in sodium and potassium and consist mainly of leucogranodiorites and granodiorites. From the meagre data so far studied it appears that a great series of arkosic sandstones and shales laid down on a pre-Cambrian basement complex was closely folded and subsequently deeply intruded by acid magma. Following this there ensued a long period of erosion, glaciation, and the extrusion of olivine basalt in the Pleistocene period (Byrd's second expedition).

It is still premature to make any positive statement as yet; but there is reason to believe that the Edsel Ford range is one of the blind ends of the virgated Andean mountain structure continued through Graham Land and then westward, and that the intrusives in the Edsel Ford range are differentiated high in sodic and potassic contents of the same magma that was intruded in the more easterly sections of the system.

The application of seismic sounding techniques has shed new light on the thickness of the Ross Shelf ice and the ice cap covering the plateau in the Pacific quadrant of the continent. Much of the floating part of the Ross Shelf ice was found to be over 600ft. thick and some 1,500 feet. On the new plateau ice thicknesses up to 2,200ft. were measured. The existence of numerous shoals and at least one island above sea level was also ascertained. These furnish a retaining structure for the Shelf ice and go far towards explaining the persistence of many of its features, such as the Bay of Whales (Byrd's second expedition). A new survey of the sea front of the Shelf ice showed that between 1912 and 1935 it had advanced northward an average of 12 nautical miles (13.8 statute miles) along the whole front between Ross island and the Bay of Whales (Byrd's second expedition).

The coast line of the Australian and African quadrants has now been largely filled in (Mawson, "Discovery II," Norwegian whalers). In place of the great blanks which were the most conspicuous feature on the maps of this region a decade ago, there are now only a few scattered reaches of small extent still marked "unexplored." Several ranges of mountains have been discovered here and there, and one in Princess Ragnhild land is of great size. It appeared from the air to extend for several hundred miles parallel to the shore about 140mi. inland and to reach an altitude of 10,000ft. (Lars Christensen). (See also ANTARCTIC EXPLORATION; EXPLORATION AND DISCOVERY.) (R. E. B.; K. L. R.)

**Antarctic Exploration.** The ships "Discovery II" and "William Scoresby," of the British Discovery Committee, engaged almost continuously in oceanographic work in Antarctic waters during 1936 and 1937. Interrupting its oceanographic work, the "Discovery II" joined the search for Lincoln Ellsworth and his pilot, Herbert Hollick-Kenyon, and on Jan. 15, 1936, found them safe at Little America, after a trans-Antarctic flight of some 2,200mi. from Dundee island which revealed the topography of a wide strip of hitherto unknown territory. Among the important discoveries were the non-existence of Stefansson strait except as an ice-filled inlet; a range of mountains (named Eternity range by Ellsworth) south of this inlet rising to 7,000 to 12,000ft. and apparently continuing south-eastward the axis of the mountains of Graham Land; and a soli-

RESCUE PARTY from the "Discovery II" which found Lincoln Ellsworth and his pilot, Herbert Hollick-Kenyon, in Little America

tary range (named Sentinel range) rising to an estimated 13,000ft. from the great ice-covered, 6,000-7,000ft. plateau at about longitude 88° W. between parallels 60° and 65° S. The segment between the 80th and 120th meridian was claimed for the United States and named James W. Ellsworth Land after the explorer's father. From aerial photographs taken on the flight topographical maps covering some 12,000 sq.mi. were constructed by a method developed at the American Geographical Society.

With Ellsworth on board, the "Discovery II" reached Melbourne on February 16. En route the Balleny islands were surveyed, Row island was determined as nonexistent, and the height of Young island fixed at 3,000ft. instead of 12,000ft. as reported by Balleny in 1839. Leaving Melbourne on March 4 the "Discovery II" continued her voyage. During January and February 1937 surveys of the South Shetland and South Orkney islands were made. The ship again left England Oct. 2, 1937, for a 20-months circumpolar cruise.

Important explorations on the Antarctic continent were concluded by the British Graham Land expedition (1934-37) led by John R. Rymill. From a base established in February 1936, in the newly named Debs islands (lat. 68° 10' S., long. 66° 52' W.) a number of reconnaissance aeroplane flights were made revealing new coasts, mountains, and glaciers. In July two parties sledging north from the base surveyed some 250mi. of complicated coastline. A sledge party leaving on Sept. 6 for an 11-weeks, 600mi. journey to the south carried out surveys along the west coast of Graham Land and along a 15mi.-wide strait some 200mi. long separating Graham Land from Alexander I island. Surveys of over 450mi. of coast southward from Matha bay revealed that no channels cut Graham Land as previously indicated by Wilkins. Another party surveyed across Graham Land in lat. 69° 50' S. and mapped 140mi. of the east coast. The results of the expedition's two years of work will be a major contribution to knowledge of the Antarctic.

In the African quadrant, Lars Christensen headed his fourth Antarctic expedition, leaving Capetown in the ship "Thorshavn,"

Dec. 28, 1936. On Feb. 4, 1937, new land was discovered from the air between Princess Ragnhild Land and Queen Maud Land in lat.  $69^{\circ} 30' S.$ , long.  $34^{\circ}$  to  $40^{\circ} E.$ , and named Prince Harald Land. A flight on February 6 disclosed a 10,000–13,000-foot mountain range extending 200 miles westward from lat.  $71^{\circ} 31' S.$ , long.  $20^{\circ} E.$  Approximately 31 flying hours were devoted to taking 2,200 aerial photographs, covering 30,000 square miles of territory and including 1,200 mi. of coast. (See also EXPLORATION AND DISCOVERY.) (L. EL.)

**Anthropology.** Anthropology, the science of race and culture, has recently gained in general interest and academic recognition largely through the effervescence of racial doctrines, the reopening of colonial issues, and events connected with the westernization of China and Egypt, India and Japan. In Europe the widening rift between democracies and dictatorships is forcing us to rethink and redefine such concepts as "progress" and "cultural efficiency," "development" and "morality," "law," "religion," and "value," on a broad, comparative, that is anthropological, basis. In all this, anthropology has itself been also forced to consolidate its spheres of activity and influence, to clarify its concepts, and to define its methods and aims. The older, more ambitious schemes, such as the discovery of origins, stages, and historical connections, demand, it is felt, a fuller understanding of what culture really is.

The first task of scientific anthropology must consist in the analysis of culture and cultural process. The demographic, economic, legal, and educational aspects of primitive communities have now become the main subject-matter of anthropology, in lieu of the more exotic phenomena, such as cannibalism, head-hunting, the couvade, and strange taboos. The nature of human marriage and family, of the State and of kinship organization, of faith, ritual, and ethics, must be understood before we take up questions of how they came into being, developed, and diffused.

**United States.**—The dominant trend in the United States still remains historical. Prof. Kroeber has recently been sponsoring statistical developments of the *Kultur-kreislehre*, following the earlier work by Prof. Jan Czekanowski of Lwów (Poland), and his pupil, S. Klimek. A new theoretical point of view in cultural anthropology has recently been developed in the school of Prof. F. Boas, led mainly by Dr. R. Benedict, Mr. Gregory Bateson, and Miss M. Mead. Their theoretical approach, that the "spirit" or "genius" of each individual culture has to be studied through some sort of intuitive empathy rather than through strictly scientific analysis, is best formulated in R. Benedict's *Patterns of Culture*, 1935. On this issue it differs from the approach advocated by the functional school of B. Malinowski (see *Human Affairs*, article by B. Malinowski, 1937), and the structural approach of A. Radcliffe-Brown.

Among the new text-books representing the American point of view must also be mentioned *Anthropology*, by A. A. Goldenweiser (1937), and R. Linton's *The Study of Man*. Two articles, by A. L. Kroeber, *History and Science in Anthropology* (in *The American Anthropologist*, 1935), and A. Lesser, *Functionalism in Social Anthropology* (*ibid.*), also give a good idea of present-day methodological and theoretical currents in American anthropology.

**Great Britain.**—Among the important literary events in British anthropology must be singled out the appearance, in 1936, of *Aftermath*, a supplementary volume to *The Golden Bough*, and, in 1937, of *Totemica*, an additional collection of evidence bringing up-to-date Sir James Frazer's researches on this subject. The volumes testify to the vitality both of the author and of the British school of anthropology.

**France.**—In France, the Institut d'Ethnologie at Paris has or-

SKULL AND SKELETON of a different and primitive type of Indian, discovered in the Sacramento Valley, California, burial mound of probably 15,000 years ago

ganized a number of field research expeditions to Africa, Indonesia, and America, and carries on the publication of valuable monographs, to mention only those of H. Labouret, M. Leenhardt, M. Griaule, and J. Soustelle. Members of the French school, in its origins largely influenced by anthropological research—Durkheim's work was determined by his ethnographic interests—were able to exchange ideas with their foreign colleagues, and show the advance made by French anthropology and sociology towards the empirical viewpoint.

**Scandinavia.**—In Scandinavia, in addition to the intensive study of Nordic folklore, general ethnographic work is being carried out, in Sweden by G. Lindblom, W. Kaudern, and other pupils of the late A. E. Nordenskiöld; in Denmark, where K. Birket-Smith is continuing the work of W. Thalbitzer and K. Rasmussen; and in Norway, where the Institut for Sammenlignende Kulturforskning is arranging and publishing lectures on the comparative study of cultures, in which Norwegian and foreign scholars, among the latter F. Boas, M. Mauss, M. Granet and B. Malinowski, have taken part.

In Holland and her colonies, practical anthropology as well as scientific field-work is being carried on steadily through the work of the Colonial Institute at Amsterdam and the Department of Ethnology at Leyden. In 1937 Prof. J. P. B. de Josselin de Jong published the first volume of his studies in Indonesian culture, the result of field-work over in the Dutch Indies.

In Belgium, the work in anthropology centres upon the colonial problems of the Congo; it is connected with the work of the museum at Tervueren and the Institut Royal Colonial Belge, and is published by these institutions, and in Kongo-Overzee.

**Germany.**—It would be incorrect to assume that German anthropology is now working altogether under the influence of the official doctrines of Nordic superiority in race and culture. *Zeitschrift für Rassenkunde*, edited by E. Freiherr von Eickstedt, probably still the best journal on physical anthropology and racial problems, is notably free from questionable or tendentious articles. The new text-books: *Lehrbuch der Völkerkunde* (edited by K. T. Preuss, with contributions by Thurnwald, Preuss, L. Adam, and Westermann); Prof. R. Thurnwald's *Die Menschliche Gesellschaft* in five volumes, and Pater W. Schmidt's *Handbuch der Methode der Kulturhistorischen Ethnologie*, the two last mentioned published in 1937, are scientific statements of anthropological problems, unaffected by any racial or nationalistic ideas.

To the critical study of the more extreme types of racialism is devoted the periodical, *Races et Racisme*, published by a research group of the same name in Paris, and supplying information on political manifestations, legal decisions, and newspaper utterances, made in the name of racial doctrine.

Physical anthropology has not yet given its final verdict, even on the question as to whether the concept of "race" is scientifically

valid. "It may be doubted whether the term 'pure race' carries with it any meaning whatsoever . . .", writes J. C. Trevor (*Science and Society*, 1937, vol. I, No. 4), summing up the views of J. M. Morant (article in *Zeitschrift für Rassenkunde*, vol. II, 1935), A. C. Haddon and J. S. Huxley, *We Europeans* (1935), and most of the American anthropologists (F. Boas, T. Wingate Todd, E. S. Hooton, M. J. Herskovits), whose experimental work has largely invalidated the concept of "stability of race," as well as its genuinely genetic character. Prof. R. Ruggles-Gates, on the other hand, maintains the view that "living man represents three or more species" (*Man*, 1936, No. 218, and 1937, No. 32). This view has the support of Sir Arthur Keith and the majority of competent German anthropologists. Even less consensus of opinion exists as to the possibility of predicting mental characters and cultural capacities from physical data.

The very prominence given to "race" and racial differences has forced the anthropologist to admit how little is really known about "race" and "racial purity"; the stability of racial characters, and above all, the correlation between the form of the human organism and cultural capacity.

The inevitable passing away of indigenous cultures under the influence of Western civilization has imposed upon anthropology the necessity of studying culture change, that is, the diffusion of Western culture among the primitive peoples. In Great Britain, organized initiative in this respect has been taken by the International Institute of African Languages and Cultures. In its journal, *Africa*, a series of articles especially devoted to the method of studying culture change has appeared (see vols. 8-9), following the first systematic outline by Dr. A. I. Richards (*Africa*, vol. 5, 1932), *Anthropological Problems in North-Eastern Rhodesia*. Dr. M. Hunter's *Reaction to Conquest*, 1936, is perhaps the first comprehensive study of the encroachment of European civilization on a primitive tribe. In America, work of this type has been pursued by Prof. Melville J. Herskovits, whose "The Significance of the Study of Acculturation for Anthropology" (*American Anthropologist*, 1937) and his statement on "Applied Anthropology" (*Science*, 1936), based largely on the work on negroes in the Old and New Worlds, expresses the American point of view. (B. MA.)

**Anti-Aircraft Weapons:** see MUNITIONS OF WAR: *Anti-Aircraft*.

**Anti-Lynching Legislation:** see LYNCHINGS.

**Antimony.** World production of antimony declined from a high of 33,800 metric tons in 1928 to a low of 18,500 tons in 1932; the general industrial recovery, supplemented by rearmament demand, brought the 1936 output back to about the 1928 level. During recent years China has supplied about 70% of the demand, Mexico 10%, and Bolivia 7%, the remaining 13% being scattered among 20 or more minor producers. The United States has no regular ore production, but several hundred tons annually are recovered as a by-product in the smelting of lead, and since 1931 an antimony smelter has been in operation in Texas, using Mexican and Bolivian ores. The output of this smelter exceeded 4,200 metric tons in 1936, and has been responsible for a considerable increase in the Mexican and Bolivian outputs, with a corresponding decrease in the imports of ore and metal from China. The United States is the largest consumer of antimony, taking about one-half of the world supply of new metal to satisfy two-thirds of its consumption demand, the other third being furnished by secondary metal recovered after previous use. The Chinese industry has been somewhat disorganized by the Sino-Japanese conflict, and though smelting operations continued at about the normal rate, shipments during the latter part of 1937 were irregular. (G. A. Ro.)

**Antioch College** continued, during 1937, its program as defined in the reorganized college plan of 1921. It continued the co-operative plan of alternate work and study, whereby students divide their time between college and a job; the broad required course program; the senior comprehensive examinations; the intra-mural athletic program; and the extensive advisory system. Combining these devices, which singly are all in use elsewhere, Antioch has worked out a distinctive pattern of education which seems to have considerable flexibility and merit. Friends of the college have been interested in the study of the required courses being made; health-study for freshmen; the research program, which in eight years has grown from \$500 to \$85,000 yearly; two courses in consumers' co-operatives; and the recognition of the college by the American Association of University Women. (A. D. HE.)

**Anti-Semitism.** There were few developments during 1937 affecting the position of Jews in Germany, and no new repressive measures of importance were undertaken, though there was little alleviation of their lot. On April 21, orders were issued for the suppression throughout the country of all lodges of the B'nai B'rith, the Jewish charitable and social organization; Rabbi Dr. Leo Baeck, president of the United Jewish lodges of Germany, and some 60 other persons connected with the lodges, had been arrested and questioned two days before; funds and documents were impounded, and the offices closed, while at the same time the secret police ordered that no meetings of Jewish associations, except the Kulturbund, should be held until June. The German-Polish Minorities Convention regarding Upper Silesia expiring on July 15, the Reich Government announced on July 3, that the anti-Jewish legislation would at once come into full force in that area, and a special law was passed providing for the retirement or dismissal of Jews in public employment there as from the end of August. In November, a Reich law was promulgated providing that persons deprived of German nationality should no longer be entitled to inherit from German subjects (even their husbands or parents), and that German citizens may deprive of their legal portion in their estate any descendant who has married a Jewish or non-Aryan person since the Nuremberg laws were promulgated in Sept. 1935.

Herr Förster, Nazi leader in Danzig, announced on Oct. 10 that the Jewish population of the Free City was to be reduced to the same condition as that of Germany, and thereafter picketing of Jewish shops, and some attacks on them, occurred, for which the National Socialist Party disclaimed responsibility. The executive committee of the World Jewish Congress wrote, at the beginning of November, to Great Britain, France, and Sweden, the Powers appointed by the Council of the League of Nations to watch the situation in Danzig, expressing indignation at the anti-Jewish measures taken there.

In Poland, Jews were for the first time publicly branded as racially "inferior" in April, by the announcement that no Jew was eligible for membership of the new National Totalitarian Party supported by M. Moscicki and Gen. Smigly-Rydz. On May 9, the Polish medical association barred Jews from membership, and the lawyers' association decided to limit the number of Jewish lawyers in the country to 10% of the total. On May 13, a serious pogrom occurred at Brest-Litovsk, lasting 15 hours, the 22,000 Jews in the city being left to the mercy of the mob. Many were injured, some fatally, thousands were ruined, and hundreds of Jewish-owned premises were damaged and looted. Towards the end of the year, measures discriminating against Jews were taken in the universities, numbered seats being introduced at Warsaw, and all non-Aryan students being segregated in a "bench ghetto." Once, Pilsudski's daughter, in protest, took her place among the

Jewish students. A boycott of Lwów high school was proclaimed by the Nationalists, as the rector refused to introduce a similar system there.

In Rumania, anti-Jewish measures were much intensified during the year. In May, the Federation of Rumanian Professional Associations, covering lawyers, university professors, doctors, pharmacists, engineers, teachers, and artists, decided to eliminate Jews, with other members of racial minorities, from those professions. At the end of December, after the formation of the National Christian Government, M. Goga, the premier, announced that Jews would be excluded from journalism and Government service and that the State would have no commercial dealings with enterprises with Jewish capital or personnel; at the same time three Jewish-owned newspapers of wide circulation, *Dimineata*, *Adeverul*, and *Lupta*, were suppressed. Except in Palestine (see ZIONISM), there have been no serious anti-Semitic activities in other countries. (See also JEWISH RELIGIOUS LIFE.)

## Apples.

Outstanding in world apple production in 1937 was the record crop of 86,000,000bu. in Germany, about 20 per cent larger than the previous highest production of 72,000,000bu. in 1934, and the 211,060,000-bu. crop of the United States, the highest yield since 1926. Canadian production was large, with a total for 1937 of 5,070,600bbl., as estimated by the Canadian Ministry of Trade and Commerce and compared to a 1936 crop of 4,115,200 barrels. Canadian production was divided as follows, with figures in parentheses being for 1936: Nova Scotia, 2,400,000bbl. (1,750,000); New Brunswick, 45,000bbl. (29,000); Quebec, 150,000bbl. (91,000); Ontario, 735,000bbl. (703,000); British Columbia, 5,220,300 boxes (4,625,100 boxes).

The United States crop of 211,060,000bu. compares with 117,506,000bu. for 1936 and a five-year (1928-32) average of 164,355,000 bushels. Production was above the average in all principal producing States except Maine, Colorado, Washington and Oregon. A larger percentage of the crop than usual was sold to canners and by-products plants because of low prices. It is estimated that Nova Scotia will export about 1,400,000bbl., and 300,000 cases of canned apples. In 1931 Nova Scotia exported 8,000 cases; preferential duties in the United Kingdom favour imports of Canadian apples over those of foreign countries and as a result the canning industry has greatly increased in Nova Scotia where cull apples brought about 80 cents a barrel, a substantially higher price than growers received in the United States, where culls and much of the crop were wasted because of low prices.

In Germany it is estimated about 21,000,000bu. of the 1937 crop will go to canners and processors. Since 1931 consumption of canned fruits and vegetables has increased 70 per cent. Although Germany has the largest crop in its history it will, because of treaty arrangements, import apples this year from Canada, New Zealand and Chile. The apple crops in England, France, Belgium, Italy, Denmark, Czechoslovakia and Hungary were lighter in 1937, the International Institute of Agriculture reported, but heavier in the Netherlands, Sweden, Yugoslavia, Bulgaria, Rumania and Austria. About half of Austria's import requirements, estimated at 185,000 to 230,000bu., will be supplied by Argentina under trade arrangements for industrial products in return.

For the last twenty-eight years the trend in apple imports has been generally upward in the United Kingdom. The five-year pre-War average (1909-13) was 7,441,000bu., and an average of 16,366,000bu. for the five years from 1929 to 1933. For the three years from 1934 to 1936 there was a small recession, the average being 14,600,000 bushels. During the past three years Canada has been the chief source of the United Kingdom's apple supply. The apple tree acreage in England was estimated by the Interna-

## APPLES—APPLIED PSYCHOLOGY

tional Institute of Agriculture in 1936 as 178,963 acres. In Wales, of 4,990ac. in fruit, 4,531ac. were in apples.

Since 1930 Japan has increased apple production and now has an annual crop of about 7,000,000 bushels. In 1937 Yugoslavia harvested its first apple crop from trees of grafted, American scions. Although naturally a small crop the quality is said to have been satisfactory, apparently settling a debated point as to whether American varieties could be grown successfully in Europe. The varieties grafted are chiefly winesap, Newtown and Delicious, and 300,000 trees similarly grafted are to come into bearing soon in Yugoslavia. (S. O. R.)

**Applied Chemistry:** see CHEMISTRY, APPLIED.

## Applied Psychology.

The outstanding psychological event in America during the year 1937 was a complete reorganization within the field of Applied Psychology. (1) The inauguration of the American Association for Applied Psychology was national in its objectives and outlook. Annual meetings for the reading of scientific papers, and the publication of an official journal were planned. *The Journal of Consulting Psychology*, previously published by the Association of Consulting Psychology, and with more local interests was taken over without change of name. The standards for membership were high and provided for two classes of members: Fellows, with the Ph.D. degree or its equivalent and four years of practice in the application of Psychology (or systematic published research of significant value), and Associates, with the Ph.D. or its equivalent and one year of practice. Four professional sections were established, namely, Clinical Psychology, Consulting Psychology, Educational Psychology, and Industrial and Business Psychology. Each section adopted its own standards of membership, which could in no case be lower than those of the parent organization. (2) State associations were established to be affiliated with the national organization and to be concerned with problems peculiar to individual States, such as legislation and employment problems. Thus New York State psychologists established the New York State Association of Applied Psychologists with membership requirements similar to those for the national body and with provision for an annual meeting for the presentation of scientific papers. Groups previously organized in other States were being transformed for affiliation with the national association. (3) Strictly local groups in cities were formed for dealing with all problems of local interest and for the discussion of scientific work at more frequent intervals than is possible through the medium of the larger units. A New York city unit was in process of organization.

It was reported that the Rumanian Government had established two psychological institutes, one for the purpose of applying psychology to economic life and the other for vocational guidance. Two additional institutes were said to be projected. (Institute psihotehnice, C. Radulescu—Motru, Psihotex, 1937, 1, 1-.)

**Aptitude Tests.**—The most comprehensive aptitude testing program undertaken since the close of the World War was in progress during the year 1937 as a part of the work of the Division of Standards and Research of the U.S. Public Employment Service. The plan envisaged a job analysis of thousands of occupations, a classification of these into groups according to the similarity of the human functions needed to succeed in them and the preparation and standardization of tests for aptitude in the performance of these functions. The procedure was expected to produce something in the nature of "occupational patterns" showing the characteristics that any given job calls for together with the standardized instruments which may be employed in detecting the presence of these characteristics in job applicants. The current concept of

aptitudes and the devices for their measurement were presented in *Aptitudes and Aptitude Testing* (W. V. Brigham, 1937).

**Motor Cars.**—The psychological problems involved in automobile driving were recognized and attacked in many countries particularly the United States, England, France, Germany, and Italy. Techniques were sought both for the detection of those who would be safe drivers, and especially for the early discovery of persons who would be prone to accidents. The U.S. Highway Research Board reported a study of 30,000 drivers, among whom less than 4% had 39% of the fatal accidents, 36% of the non-fatal personal accidents and 38% of the accidents in which no one was injured. (See "Highway Accidents," H. M. Johnson, *Science*, 1937, vol. 86, p. 14.) Concerning the causes of accident proneness there was difference of opinion. According to one view the key was to be found in "ability-capacity patterns" ("Fact and Fancy Regarding Driver Testing Procedure," A. Lauer, *Journal of Applied Psychol.* 1937, 21, 173- ); according to another it was primarily a matter of "emotional balance" or the presence of "nerves" as a result of which the driver loses his "presence of mind." ("Recherches Experimentales sur les Causes Psychologique des Accidents du Travail," J. M. Lahy, and S. Korngold, *C. R. 8th Internat. Conf. Psychotech.* 1935, 140- ); according to another it was a consequence of a general instability which might be detected by tests of attention and reaction time. ("Unfallaffinität im Verkehrswesen," G. Mayerhofer, *C. R. 8th Internat. Conf. Psychotech.* 1935, 256); according to still another it was a matter of temperament and personality ("Contributo alla psicologia degli infortuni automobilistici," H. Brugger, *Arch. Ital. Psicol.*, 1936, 14, 55- ).

**Aviation.**—The psychological factors in aviation were vigorously attacked during the year 1937. Besides the more routine attempts to detect potentially good aviators, the increased flying altitude raised the problem of the susceptibility of pilots and passengers to low oxygen atmospheres. These were studied during mountain climbing expeditions, during aeroplane flights and in laboratory chambers with artificially controlled atmospheres. Behaviour changes have been detected and measured both in the intellectual abilities and in temperament. It was found that individuals differ considerably in their power to withstand high altitudes. (See "Psycho-physiological Studies at High Altitude in the Andes," R. A. McFarland, *Journal of Comparative Psychol.*, 1937, 23.) Two trends were apparent in the tests for aviators, one suggested a "flying talent" comprising in part ability to orient oneself in three dimensions, which may be analyzed into various specialized sensory motor functions ("Functionale und charakterologische Fragen der Fliegereignung," P. Metz, *Zeitschrift für angewandte Psychol.* 1936, 153- ) and the other, more general personality factors among which extroversion was found to be a favourable indicator ("Value of Determining Reality Adjustment as a Means of Estimating Flying Aptitude," O. F. McIlney and W. F. Jensen, *Mental Hygiene*, 1937, 21, 101- ).

**Intelligence Tests.**—The Intelligence test continued to be the most widely used psychological test instrument and many problems of practical interest were attacked with it during the year. Important among these was the study of the relationship between size of family and the intelligence of the children in a typical English industrial city and in one "unspoilt rural area" in England. (*The Fight for our National Intelligence*, R. B. Cattell, 1937.) There appeared to be a distinct inverse relationship between the number of children in a family and their intelligence level. If it is assumed that 3.6 children per family are necessary to keep the population at a constant level, then only family groups with an I.Q. of .60 to .80 (with 3.6 or more children per family) have families large enough to perpetuate themselves. If

conditions were to remain unchanged there would be in the course of one generation, 30 years, an increase of 24% in mental deficiency and a decrease of 35% in the number of gifted children (those with I.Q. about 1.20). The inverse correlation between size of family and the intelligence of children was confirmed by Bradford (E. J. G. Bradford, "The Relation of Intelligence to Varying Birth-rate in Different Social Grades," *British Journ. of Educational Psychology*, 1937, 1, 229- ).

A revised edition of the Stanford-Binet Intelligence Test appeared after a lapse of 21 years since the publication of the widely used first edition. The new edition contained two equivalent forms, instead of the one form in the earlier edition. This was a much needed change. Each form contained 129 tests, while omissions were suggested for briefer testing. The tests were made more effective for the ages below six years, and certain changes have been adopted for computing the I.Q. for ages above thirteen years. (*Measuring Intelligence: A Guide to the Administration of the New Revised Stanford-Binet Tests of Intelligence*, L. M. Terman and M. A. Merrill, 1937.)

A psychological investigation which attained importance because of the number of persons affected by its findings concerned the use of blackboards in school work. The National Institute of Industrial Psychology (England) studied the effect upon the eyes of copying from a blackboard upon white paper. Such copying requires a child to shift rapidly and frequently between reflection surfaces whose values differ by as much as 75%. Various colours of surface and writing material were tested and the most efficient combination was found to be a yellow surface and blue chalk. Reading efficiency was increased by about 15%. The reduction in visual fatigue was not measured. The findings were so important that the research was being continued. ("An Experiment Showing the Superiority of a Light Colored Blackboard," W. D. Seymour, *British Journ. of Educ. Psychol.* 1937, 1, 259- ) (A. T. P.)

**Aptitude Tests:** see APPLIED PSYCHOLOGY: *Aptitude Tests*.

**Aquariums.** Undoubtedly the most ambitious design in aquarium construction saw ground broken in 1937 on the coast of Florida, U.S.A., sixteen miles south of St. Augustine. This undertaking, decidedly unorthodox as compared with any existing aquarium, entailed the construction of two im-

SKETCH OF AQUARIUM at Marineland, near St. Augustine, Fla., where larger specimens of sea life than any heretofore in captivity are now on exhibit

CONSTRUCTION DETAILS OF AQUARIUM with windows in the bottom and sides to facilitate study and motion pictures of ocean life

mense outdoor tanks of concrete. One is seventy-five feet in diameter and the other, rectangular, one hundred feet by forty feet. Visitors may view the exhibits from above as well as from windows in the walls. It is planned to display in these tanks much larger specimens of ocean life than any aquarium has heretofore attempted and the enclosures are to be as near like miniature oceans as it is possible to make them. The supply of suitable sea water is largely an engineering problem, albeit one of considerable magnitude. Plans include using the advantages of these large tanks for public exhibition, the taking of motion pictures and for scientific study. The project is to be self-supporting. The problem of capturing and handling the immense creatures contemplated, without damage, is considerable and the success of the project will depend to a considerable extent on the development of suitable methods.

Plans have been laid for the construction of a Government aquarium at Colombo, Ceylon. It is to include both marine and fresh-water displays and is to be operated in connection with a fisheries laboratory. A new municipal aquarium is under construction in Baltimore, Md., and the parts finished are already in operation. The official opening will be held in the early part of 1938. The chief attention is being devoted to fresh-water fishes. The oldest existing American aquarium suffered the loss of its long-time director through retirement. Dr. C. H. Townsend, Dean of American Aquarists, had led since 1902 the New York aquarium from a small start to its present important position and retired, to the day, after three and one-half decades of service. During his tenure of office 74,387,887 visitors viewed the displays. Plans are in various stages of development for public aquaria at Charleston, South Carolina, Raleigh, North Carolina, and at the Virgin Islands.

(C. M. Br.)

**Aqueducts** are designed to carry water for use as power, irrigation and supply for cities. In the United States alone, 69 dams exceeding 200ft. in height were completed or under construction in 1937.

Boulder dam on the Colorado river and 727ft. above bedrock, the highest in the world, was completed on March 1, 1936. The largest artificial lake, 115mi. long and 8mi. broad has been filling up and development of power, irrigation and water supply is proceeding. Grand Coulee dam, State of Washington, will have 2½ times as much concrete as Boulder dam and it is estimated that 2,700,000 horse-power will be developed. Bartlett dam on the

Verde river in Arizona is an example of the multiple arch type. Fort Peck dam on the Missouri river is an enormous embankment, nearly 4mi. long and intended to control flood waters. Its estimated cost is \$86,000,000. In March 1937, New York city began work on a project, estimated to cost \$273,000,000, by which additional water is to be carried from the sources of the Delaware river under the Hudson river by an 85mi. tunnel to the existing Croton and Kensico reservoirs. This scheme will increase the city's existing supply by 50% and is expected to provide for a population of 12,000,000. The Hetch-Hetchy aqueduct from San Joaquin Valley to San Francisco, Calif., will include two tunnels and a pipe line at an estimated cost of \$16,375,000. The capacity will be 200,000,000 gallons daily. Manchester, England, with surrounding urban areas, has derived much of her water from Thirlmere near Helvellyn, 96mi. distant. The city has been completing 84mi. of aqueducts and a dam by which Hawes Water becomes a reservoir and the remote village of Mardale, with its inn and church, is largely submerged. Moscow has a scheme for drawing water from the Volga through an 80mi. canal, raising her consumable supply from 140 pints per person per day to 275 pints—an average which, however, still falls below what is usual in more highly developed municipalities. (See also DAMS.)

**Arabia**, the general name of the vast peninsula (c. 1,100,000 sq.mi.), much of which is largely desert and still unexplored, bounded N. by Transjordan and Iraq, W. by the Red sea, S. by the Gulf of Aden and the Arabian sea, and E. by the Persian gulf and the Gulf of Oman. Nominally under the sovereignty of Turkey from the 16th century till the World War, it has since become divided into the kingdom of Saudi Arabia, the imamate of Yemen, the sultanates of Oman and Kuwait, and the British Crown Colony and Protectorate of Aden, and (in the Persian gulf) the British Protectorate of the Bahrein islands.

Of these, by far the most important is the kingdom of *Saudi Arabia*, formed in 1932 by the union of Hejaz and Nejd, with certain dependencies, and occupying under its king, Ibn Saud, about 800,000 sq.mi. with a mainly nomadic population of about 4,500,000 Arabs. The capital is Riyadh, in Nejd, almost in the centre of the peninsula. There are no great cities; Mecca, in the Hejaz, the largest, the birthplace of Mohammed and in consequence the great pilgrimage centre of all Islam, has some 70,000 inhabitants; Jeddah, the chief port, at which pilgrims for Mecca arrive, about 30,000; Medina, where the prophet died, about 20,000.

The people of the country are entirely Mohammedans, largely of the Wahhabi sect, of which the king is the head. There is no organized educational system, but some elementary teaching is given in connection with the mosques.

Dates, wheat, and barley are grown, and other fruits, but pasturage is more important than agriculture, camels and sheep being extensively raised, and horses exported to India and elsewhere.

The country's mineral wealth is almost entirely unexploited, though concessions for oil borings have been secured by foreign interests. Manufactures are practically non-existent. Transport is now very largely by motor-car; the roads are generally mere tracks, though a partly-metalled road connects Mecca with Jeddah. The Hejaz railway runs from Damascus in Syria to Medina, though the portion passing through Arabia is not at present in use; and pilgrims to Mecca travel from Jeddah largely by motor omnibus.

The unit of coinage, since 1936, is the riayl, agreeing in weight, size, and fineness with the Indian rupee, exchanging at par at the rate of 20 to the gold sovereign.

No statistics of state finances or of total trade are available. The exports from Saudi Arabia to the United Kingdom in 1935 were valued at c. £21,000 and the imports from the United Kingdom at c. £70,000. There are English and Dutch banks at Jeddah.

Ibn Saud is organizing a small regular army, but *ad hoc* levies are the ordinary defence forces. A few aircraft have been purchased.

*Yemen* is a kingdom (present ruler, the Imam Yahya Muhammad Hamid ed Din) in the south-west of the Arabian peninsula, south of Saudi Arabia and north of Aden, about 75,000 sq.mi. in area, with some 3½ million people. Its capital is San'a (population c. 40,000); other towns are Hodeida, the largest seaport (c. 50,000), Zabid, and Mocha, whose coffee is exported from Hodeida. The people, who are mainly Shiite Mohammedans, are largely engaged in growing coffee and cereals (wheat, millet, and barley).

*Oman*, a sultanate of about 80,000 sq.mi. at the south-east corner of Arabia, governed at present by Sultan Sayyid Said bin Taimur, is mainly a mountainous and unfertile tract (save for the Batinah coast, extending about 100mi. north-west of Muscat). Its population is about half a million, including many negroes. Muscat, the capital, with the town of Matrah, which adjoins it, has a population of some 13,000, and is a seaport of importance, on the mail route to India. Dates are grown and camels bred. Transport is by motor or pack animal. There is considerable trade with India, rice, coffee, and sugar being imported; dates, limes, and dried fish exported. In 1935-36 the imports were valued at c. £285,000 and the exports at c. £245,000.

The sultanate of *Kuwait* is a small state at the head of the Persian gulf, adjoining Iraq on the east and north. It is ruled at present by Sheikh Ahmed Ibn Jabir al Subah. The population, excluding nomads, is some 80,000. The capital and port of Kuwait (population c. 60,000) is a place of call for Imperial Airways liners, and an important depot for the gulf and Indian ocean carrying trade. Boats and dhows are built in the local shipyards. Exports in 1934-35 were valued at £80,000 and imports at £277,000.

On the south side of the bay at the south end of the Persian gulf are the territories of the six *Trucial Sheikhs* of Sharja, Abu Dhabi, Dhahi Ummel, Ras el-Khaimah, Qawein, and Ajman, along what was formerly called the Pirate Coast. The sheikhs are in close treaty relations with the British Government, through the political resident in the Persian gulf at Bushire. Their territories cover about 6,000 sq.mi., and have some 80,000 inhabitants. Pearls are exported to India.

The history of the Arab countries during 1937 has been mainly concerned with the Pan-Arab movement centred at Damascus, and supported by Italy. The Italian radio station at Bari was used during the year to disseminate anti-British propaganda by broadcasts in Arabic, and as a counter-move the British Broadcasting Co. began, in the new year, 1938, to broadcast programs in Arabic. At the Pan-Arab congress at Bloudan (Syria) in September, all the

Digging at LINDENMEIER SITE. Bones and artifacts occur along the bottom of dark layer seen in lower part of excavation

Arab states, except Yemen, were represented, and the president, Naji Survaiddi, former prime minister of Iraq, said that Arab support of Britain must depend on the latter's abandonment of Zionism, "a cancer in the body of the Arab countries which must be removed, otherwise it would cause the death of the body." Unless Britain agreed to this course, she could no longer count on Arab support in time of need, and the Arabs must seek a new alliance to protect their rights.

No generally acceptable scheme of Arab federation, however, has yet been mooted. In the late autumn overtures of friendship were made to the Yemen by Mussolini, who made a present of tanks and machine-guns to the king, the latter responding with a gift of Arab horses. (See also MEDITERRANEAN, THE.)

**Arbitration, International:** see PERMANENT COURT OF INTERNATIONAL JUSTICE.

**Archaeology.** Students of American archaeology seek to reconstruct the story of the development of the many native cultures of the New World by an examination and interpretation of the tangible remains which are found in the ruins, refuse heaps, and cemeteries. The evidence on which these studies depend consists of materials, conditions and relationships discovered through survey work and excavation in the field. These data are then studied and analyzed in museums and laboratories before the results of the research may be prepared for publication. During 1937, progress was made in these aspects of American archaeological research through the efforts of a host of individuals working under the auspices of a large number of organizations and institutions. The two countries in which the most archaeological activity exists are the United States and Mexico. Considerable work in this field is being carried forward in most of the Latin American countries, especially in Central America and in western South America. The majority of the institutions sponsoring work in American archaeology are located in the New World. However, a few European museums and scientific bodies contribute to the knowledge of the subject by the publication of the results of expeditions sent to the Arctic region, Mexico, Central America, and parts of South America.

One of the major problems of American archaeology is the de-

EXCAVATIONS revealing a broken table throne at Piedras Negras, Guatemala, by the expedition of the University Museum, University of Pennsylvania

termination of the antiquity of the human occupation of the New World, the distribution and routes of dispersal of these earliest Americans, and the kinds of cultures which they possessed. General interest in this fundamental question was greatly stimulated by the highly successful International Symposium on *Early Man* held in Philadelphia, Pa., on March 17 to 20, 1937. On this occasion, the Academy of Natural Sciences of Philadelphia, in celebration of the 125th anniversary of its founding, acted as host to geologists and anthropologists from all parts of the world while they reported upon and discussed the evidence relating to most ancient man on all the continents, including the Americas. Later in the year, a number of field parties secured evidence to be added to that obtained in previous years, indicating that ancient man had occupied sites in at least Colorado, New Mexico, and California. Harvard geologists established that the artifact level at the Lindenmeier site of a Folsom village near Fort Collins, Colo., was contemporaneous with the third phase of the Wisconsin glaciation, thereby strengthening the conclusion that man had already arrived in the New World at the time of the final stages of the last great glacial epoch.

The second major problem of American archaeology, namely, that of studying the growth of individual cultures in the New World, occupied the attention of most of the organizations interested in this subject. Limitations of space prevent even a brief description of the activities of the many field parties of 1937. The contributions which they have made to the problems of American archaeology will not be known until after the laboratory work has been completed and the results published. Nearly all parts of the New World witnessed the continued examination of archaeological sites. Several expeditions visited the Alaskan area. In the United States, the south-western area and the wooded section of the Mississippi Valley were the centres of active field work, as in former years. Archaeological expeditions worked also in California, along the Gulf Coast, on the Great Plains, in the Great Lakes area, and in many of the eastern States. Especial mention should be made of the increased field activities in the north-western States and in the New England area. While reports of the activities in the Latin American countries are not yet available to the writer, it may be safely assumed that archaeological field work was carried on, as in former years, in the more actively interested countries, especially Mexico, Peru, Brazil, and the Argentine Republic.

The United States government continued to support the field studies by the Bureau of American Ethnology at the Lindenmeier

site in Colorado, and sponsored work by the National Museum in Kansas. Under the auspices of other agencies, including the emergency administrations, this government assisted a number of other archaeological field projects, the most important of which were the continued survey of the basins to be flooded by the constructions of the Tennessee Valley Authority, and the further investigations of archaeological sites in the neighbourhood of Macon, Ga., at which the Ocmulgee National Monument was recently established. A part of these emergency funds was used to finance excavations by interested but untrained students, which increased the total available archaeological data, but undoubtedly caused the destruction of valuable additional information.

A number of the governments of Latin America have sponsored research in the archaeology within their borders. Among these, that of Mexico is most active in sponsoring an elaborate research program upon the remains of the ancient cultures in that country. In the area of the Maya civilization, field parties from the Carnegie Institution of Washington and the University of Pennsylvania Museum carried forward the long-time projects of these institutions, in co-operation with the governments of Mexico, Guatemala, and Honduras. It may be safely assumed that a number of the national museums in the South American countries continued their field investigations during the year.

During 1937, progress has been made in the museums and laboratories in arranging, analyzing, and interpreting the several varieties of archaeological data obtained through work in the field, bibliographic reference, and comparative studies with other museum collections. Improved techniques in the field have been reflected in the laboratories by a greater objectivity and a more critical analysis of the evidence. The majority of the laboratory work dealt with the studies upon archaeological cultures of individual sites or closely related ones in a small area. The increasing attention being given in the United States to laboratory problems is illustrated by the growing interest in the methods of ceramic technology, the inauguration of a project at the University of Chicago to study the application of tree-ring chronology to the eastern United States area, and the establishment at the Ohio State Museum of a Lithic Laboratory.

The year was also marked by the more clearly defined integration of interest among both professional and non-professional students of American archaeology. This was manifest not only in the type of articles appearing in the several journals, but also in the growing number of visits by archaeologists to the expeditions and laboratories of their colleagues in other institutions. It was demonstrated by the nature of the emphasis placed on archaeology at the inter-organizational group meetings such as the summer and winter meetings of the American Association for the Advancement of Science in Denver and Indianapolis respectively, the annual meeting of the American Anthropological Association, the spring meetings of its Central Section, and the annual meeting of the Eastern States Archaeological Federation. More or less informal conferences were held upon archaeological subjects during the course of the year, the most important of which was probably the Chaco conference held in New Mexico in August. That this integration has an international aspect is shown by the increasing awareness on the part of archaeologists in the United States of the problems and progress made by their colleagues in Latin America, particularly in Mexico. During the year, an Institute of Andean Research was organized to promote and foster anthropological research in the Andean region. A number of the members of the Executive Committee are United States students of American archaeology. The growing influence of the Society for American Archaeology, which is now in its third year, is at least in part responsible for this increasing integration of interest among professional archaeologists and the growing co-operation between

PALAEONTOLOGISTS begin a test pit in seeking traces of primitive man in the South-west

them and non-professional students of the subject.

The list of articles, reports, and books on American archaeology issued during 1937 was far too lengthy to permit adequate description in this brief article. The more significant publications included: *Early Man*, edited by G. G. MacCurdy, which is the report on the Philadelphia Symposium held last spring; *Archaeology of St. Lawrence Island, Alaska*, by Henry B. Collins, Jr., issued as one of the Smithsonian Miscellaneous Collections; *Rediscovering Illinois*, by Fay-Cooper Cole and Thorne Deuel, published by the University of Chicago; *Coclé*, by S. K. Lothrop, which appeared as one of the Memoirs of the Peabody Museum of American Archaeology and Ethnology of Harvard University.

(C. E. GU.)

**Eastern Hemisphere. Old Stone Age.**—The world-wide extension of exploration has shown that the culture sequence deduced from the stratigraphy of western Europe does not give an exhaustive or universally applicable summary of man's industrial development. In Lower Palaeolithic times, there existed, parallel to the Chellean and Acheulian cultures, typified by the *coup de poing* or hand-axe, also flake-cultures to which hand-axes were alien—the Clactonian, appearing already in Chellean times in western Europe, and the Levalloisian that is not demonstrably earlier than the Acheulian. But by the latter period the several cycles often interact. Still, even in the Middle Palaeolithic of western Europe, archaeologists distinguish (1) a pure Mousterian (simple flakes without hand-axes), (2) a Mousterian of Acheulian tradition, using hand-axes, and (3) a Mousterian using the Levallois technique. The Middle Palaeolithic cultures of Africa and Hither Asia seem all technically Levalloisian though the type tool is in form a Mousterian point. The same type tool also survives in an Upper Palaeolithic context in China and Siberia, and, in association with specialized variants, also in the Aterian of north Africa and in the Bambata and Still bay cultures of central and east Africa. (See brief summaries in Burkitt, *The Old Stone Age*; Leakey, *Adam's Ancestors* and *Stone Age Africa*.)

**Palestine.**—A culture sequence has been definitely established with Dr. Garrod's publication, in *The Stone Age of Mount Carmel* (1937), of the stratigraphy observed and materials collected in three caves in the Wady Mughareh. The succession reported is (from the base up) as follows: (1) a crude flake industry equivalent typologically and stratigraphically to the Tayacian of La Micoque in the Dordogne; (2) a very rich Upper Acheulian, interrupted by a thin layer containing blade tools of Upper Palaeolithic aspect; (3) deep Levallois-Mousterian layers yielding remains of 12 human skeletons; (4) a Lower Aurignacian; (5) two or three stages of a culture typologically ancestral or equivalent to the French Middle Aurignacian; (6) the mesolithic Natufian.

**South Africa.**—In the same year, Dr. van Riet Lowe geologically fixed the development of the hand-axe cultures in "The Geology and Archaeology of the Vaal River Basin" (*Geological Survey Memoir*, 35). Pebbles flaked into tools—the African pre-Chellean—go back to a dry epoch preceding the "first wet phase." The latter then witnessed the development of the African Chellean, and three phases of African Acheulian characterized throughout by hand-axes and cleavers which are often made from flakes and, from African Acheulian II on, from flakes struck from Victoria West cores, prepared by a sort of Proto-Levalloisian technique. In a second wet phase the same cycle, but now blended with the Levalloisian, reappears as the Fauresmith culture, equivalent to Leakey's Nanyukian in central Africa. The Memoir admits that Africa as a whole during Lower Palaeolithic times formed a province of the hand-axe cultures. These embraced India, too, extending as far north as the Punjab by the Second Interglacial, and even reached Java, but have not yet been reported in Upper Asia. (See *Early Man*, p.257; *Bull. Raffles Museum*, Ser. B, 1936, 57;

SEARCHING FOR THE FIRST AMERICAN in fossil beds near Clovis, New Mexico

*Proc. Amer. Philos. Soc.*, 77 (1937), 290-308.)

Fossil Men of Lower Palaeolithic age have become relatively well known since 1928, no fewer than four new specimens being reported during 1937. Three additional skulls of the genus *Sinanthropus*, from the caves of Chou-kou-tien, near Peking (where the genus was first discovered in 1926), were announced in *Nature* on February 13, and the first reconstruction of a complete *Sinanthropus* skull was published there on December 11. In the *Illustrated London News* of December 11, von Koenigswald described from Central Java a new skull of the genus *Pithecanthropus*, more perfect than the famous skull-cap discovered by Dubois in 1891, but derived from the same Middle Pleistocene horizon. An infantile skull, discovered in 1936 with an Early Pleistocene fauna at Modjokerto, is now thought to belong to the same genus. Neither *Sinanthropus* nor *Pithecanthropus* demonstrably made hand-axes. Both are exceedingly ape-like, with a continuous bony ridge (supra-orbital torus) above the eyes, a retreating forehead, a low skull, and a chinless lower jaw equipped with a "simian palate" on the inner side. The cranial capacity of the new *Pithecanthropus* is only 750c.c. (150c.c. less than that of Dubois' skull); that of *Sinanthropus* varies in the new skulls from 1,050c.c. to 1,200c.c. Weidenreich opined (*J.R.A.I.*, 1937, 51-66) that *Sinanthropus* was more primitive than *Pithecanthropus*, but might be ancestral to *Javanthropus*, another archaic hominid found during 1934 in the Late Pleistocene deposits of the Solo river, east Java. Antler axes and harpoons, comparable to the Lyngby and Azilian types of mesolithic Europe, were found at the same horizon. Of all the skeletons of Lower Palaeolithic age so far discovered, none unambiguously represents the authors of the hand-axe cultures, nor yet is universally accepted as being on the direct line of ascent to modern man. But the Middle Palaeolithic population of the Mount Carmel caves comprised individuals that combined in a single skeleton peculiarities found in the Neanderthals who created the Mousterian culture of western Europe with others distinctive of modern men—for instance, a supra-orbital torus and a good chin (*Early Man*, 41-53; 349-60).

**Upper Palaeolithic.**—In this phase, too, archaeologists today recognize, instead of a single evolutionary series, a multiplicity of distinct contemporary cultures. So in east central Europe and Russia a series of cultures ran parallel to the Aurignacian, Solutrean, and Magdalenian of France. Their decorative art was not naturalistic, but employed geometric patterns, notably the maeander (at Mezin in the Ukraine) and the spiral (at Malta in Siberia), but for magico-religious rites female figurines were carved in ivory. Their faces are generally left featureless, but in

the *Illustrated London News* of Oct. 2, 1937, Absolon published a fine palaeolithic "portrait head"—a tiny carving of mammoth-ivory from Vestonice, in Moravia, apparently contemporary with the western Upper Aurignacian.

**Mesolithic.**—The first appearance of man on the frozen plains of northern Europe has been put back to Late Magdalenian times by Rust's publication in 1937 of his excavations at Meiendorf and Stellmoor, north of Hamburg. While the plain was still open tundra, reindeer hunters used to camp on it between June and September beside small meres.

On the camping-places only flint-blade tools survive, but the peat and mud of the adjacent meres have preserved tools in all stages of manufacture out of reindeer antler, antler harpoons, arrow-heads, and knife-handles with flint-blade still in place and the skeletons of whole reindeer that had been cast into the waters, weighted with stones, as sacrifices. These reindeer were more closely allied to the American and east Asiatic species (*Rangifer arcticus*) than to the modern European reindeer (*R. tarandus*). Their hunters were but temporary visitants to these far-northern tundras, having their winter quarters probably in southern Germany.

Another encampment at Stellmoor, however, dates from a very much later time, when pinewoods had already invaded the tundra, though reindeer were still the chief game in north Germany. The reindeer were hunted by men of the Ahrensburg-Lyngby culture with arrows the wooden shafts of which as well as their asymmetrical tanged flint points have been preserved in the peat. Beside the mere, the hunters set up a reindeer's skull on a stout post—a sort of totem pole. And they were equipped with a sort of axe of reindeer antler, a first attempt at mastering the forests that in mesolithic times replaced the tundras and steppes to which palaeolithic hunters had been accustomed in Europe. The Ahrensburg culture is thus the oldest representative of the great cycle of what have been termed Forest Cultures. All these are distinguished, both from the earlier palaeolithic cultures and from the contemporary Azilian and Tardenoisian, by the possession of axe-like tools for dealing with timber. The Maglemosean of Denmark is only one facies of this complex, other aspects of which are seen east of the Baltic at Kunda and again to the west in south-eastern England.

Thanks to the modern technique of pollen analysis, the several phases in the evolution of these mesolithic cultures can now be correlated with changes in the composition of the north European forest and of the climatic régime that conditioned them. (See Clark, *The Mesolithic Settlement of Northern Europe*, 1936; Childe in *Early Man*, 1937, 233-42; Rust, *Das altsteinzeitliche Rentier-jägerlager Meiendorf*, 1937; "Die Grabungen bei Hof Stellmoor," in *Ofa*, i, 1936.)

**Neolithic.**—A neolithic economy controlling its own food-supply by agriculture and stockbreeding could not evolve spontaneously in mesolithic Europe; the cereals and domestic animals upon which it was based must have been introduced from Hither Asia or north Africa. And, in fact, systematic excavations during the last 10 years have amply demonstrated the hoary antiquity of the new way of life in Hither Asia. In the Natufian of Palestine, that lacks axes and pottery and is classed as mesolithic on account of its microlithic flint work, sickle teeth, mounted in bone handles, suggest that wheat or barley was already being cultivated. At Jericho the debris of "neolithic" settlements had formed an accumulation seven or eight metres thick before the local "Bronze Age" began about 3000 B.C. The high antiquity of food-production is even more dramatically demonstrated in Mesopotamia, at Erech and Nineveh, where the ruins of successive farming villages and townships had produced mounds 20 to 25 metres high before 3000 B.C.

ORIENTAL INSTITUTE WORKMEN clearing the north front of the Apadana or royal audience hall of Darius and Xerxes at Persepolis, Iran

The earliest neolithic of the Orient may indeed be as much older than the classical neolithic of Britain or Switzerland as the latter is than the neolithic culture of New Zealand in A.D. 1800. (See Childe, *New Light on the Most Ancient East*, 1936, and, for Jericho, *Liverpool Annals of Arch. and Anthr.*, xxii-xxiii.)

The British neolithic culture represented in "camps" girt with ditches interrupted by frequent causeways and by burials under long barrows is now seen to be one branch of a great western cycle to which the earliest Swiss lake-dwellings also belong. It is characterized throughout by leathery pots that suggest a north African origin for the civilization since very similar pots were current in the neolithic village of Merimde, north of Cairo, on the western edge of the Nile delta.

In 1937, a long barrow, the sepulture distinctive of neolithic Britain, has for the first time been found in a definite relation to a neolithic causewayed camp, during the fourth season's excavations at Maiden castle, near Dorchester. The barrow, of the unprecedented length of 1,760ft., cuts across, and is therefore later than, the ditch of the original neolithic camp. Still the pottery from the bottom of the barrow's ditches is still purely neolithic, so that the monument was presumably erected before the "Bronze Age" Beaker-folk reached Dorset. These observations perhaps tend to enhance the probability that neolithic farmers first reached Britain as a result of a slow landwise trek across France rather before the diffusion of megalithic tombs by maritime intercourse along the Atlantic coasts.

**Megalithic Tombs.**—In *Antiquity*, 1937, 185, Daniel reminds us that the varieties designated respectively "dolmens," "passage

graves," and "long stone cists" (better "gallery graves") cannot be used as indicative of successive periods of time except in Denmark and Sweden, and even there do not evolve one out of the other without external stimuli. The several types of megalithic burial chambers may embody distinct traditions, but are often contemporary.

While in Scandinavia megalithic tombs are products of a neolithic population, their builders in Mediterranean lands were generally, if not in all cases, using metal tools, presumably because the knowledge of metallurgy spread slowly from the south northwards. To call a megalithic tomb neolithic or bronze age need not imply anything about its absolute antiquity.

**Bronze Age.**—The arts of metal-working were discovered east of the Mediterranean, and systematically applied first in the cities of Mesopotamia and the Indus valley and then also in Egypt. In Mesopotamia and India tin-bronze was in use at least as early as 2800 B.C. By this date society in Egypt, Mesopotamia, and India was already organized in cities, wherein secondary industry, trade, and public employment could absorb the surplus of a prolific agricultural population. The urban industries' need for imported raw materials (including metals) was a main factor in diffusing the science of metallurgy among surrounding barbarians. The routes whereby Mesopotamian technical skill was transmitted westward have been defined during 1937 by discoveries in Syria and Turkey.

**Mari,** on the Middle Euphrates (just west of the Syrian-Iraqi frontier), was an outpost of Mesopotamian urban civilization before 3000 B.C. Three large tombs, rather older than 3000 B.C., were announced last year. They are stone-built chambers roofed by corbelling, and thus anticipating Early Aegean funerary architecture. In one a human victim has been slain by pins stuck into his throat.

A later palace at the same site, built about 1900 B.C., was adorned with fresco paintings, the earliest yet found in Mesopotamia. The naturalism of some scenes and certain motives employed suggest influence from Crete, perhaps even the employment of Minoan artists.

Farther west, in the Orontes valley, the interaction of Aegean and Mesopotamian civilizations about 1650 B.C. is illustrated by Minoan patterns on the local pottery of Tal Atchana. (See *Syria*, 1937, 80, and 234; *Archiv. f. Orientforschung*, 1937, 86; *Illustrated London News*, Oct. 30, 1937; *J. Hellenic Studies*, lvi (1936), 130-4.)

VIEW OF THE EXCAVATIONS of the Megiddo Expedition of the Oriental Institute, University of Chicago, at the Mound of Armageddon, which in 1937 revealed the most spectacular gold and ivory treasures ever found in Palestine

**Anatolia.**—Since 1929, excavations at Kusura, near Afyon Kara Hissar, and Ahlatlibel, near Ankara, have confirmed the belief that knowledge of metallurgy was transmitted to Troy (Hissarlik), on the Dardanelles, partly across the plateau of Asia Minor. By the third millennium B.C., these sites were little townships, where metal was used side by side with stone tools and worked into forms already familiar from Troy and central Europe; their civilization was in general most closely allied to that of Troy. But a true estimate of the technical level attained has been made possible only last year through the publication of the Turkish Historical Society's discoveries at Alaca Hüyük in the Halys basin, where a series of rich "royal tombs" came to light. Vessels of copper, gold or silver, illustrate shapes—beaked jugs, cups, and keeled bowls—already familiar in clay from Ahlatlibel and Troy. A spear-head with hooked tang and a copper "frying-pan" suggest connections with Early Cycladic culture in the Aegean; numerous hammer-headed pins prove contact with the Kuban culture of south Russia. Art is illustrated by rather stiff figures of stags and human beings in copper or silver, and much handsome openwork in gold or copper, on which the swastika sometimes appears. Despite the technical excellence of jewellery and metal-work—even iron was used for ornaments—the Anatolian civilization revealed by the tombs remains essentially barbaric without writing or even seals. (See *Türk Tarih arkeologiya ve Etnografya, Dergisi*, ii, 3-90; *Türk Tarih Kurumu, Belleten*, i-ii (1937); *Archaeologia*, 86, 1-60.)

**North-western Europe.**—Metallurgical knowledge was transmitted both by sea-ways along the Mediterranean and Atlantic coasts (in the wake of megalithic tombs) and by land up the Danube valley. In 1937 Childe (*American Anthropologist*, 39, 1-22) and Oriordain (*Archaeologia*, 86, 195-315) emphasized the advantage conferred on the British Isles by the possession of both copper and tin and the consequent high relative antiquity and predominant influence of Britannico-Hibernian metallurgy in the early bronze age of northern and western Europe. Denmark and north Germany were still in a neolithic stage of culture, while the British Isles were in full mastery of bronze. This British bronze age, inspired by sea-borne commerce, began at least as early as the central European Aunjetitz bronze age that is rooted in Anatolia. Hence the Beaker-folk, who invaded Great Britain from the Continent in at least two distinct waves, did not introduce the arts of metallurgy, though they may have been the first British customers of the Irish-Cornish metal-workers.

**Iron Age.**—Excavations in Germany have suggested that vitrification was there produced by the ignition of ramparts constructed, after the manner of Gallic walls, described by Julius Caesar, of two parallel facing walls of dry masonry tied together by transverse beams and containing a core of rubble and timbers. To determine whether this account would apply to Scotland, model Gallic walls were built at Plean and at Rahoy in 1937. The walls were successfully ignited by fires kindled against them, and burned for five and twelve hours respectively. On cooling, the characteristic phenomena of vitrification were observed in the cores of both walls. In the same year excavation proved that the vitrified fort at Rahoy was contemporary with a Gallic walled fort at Abernethy (about 200 B.C.). Since Gallic forts were being erected in Scotland as early as any vitrified forts, and since the conflagration of their ramparts would produce vitrification, this effect need not have been designed by their builders.

(V. G. C.)

**Archery.** Of international significance was the Seventh Annual Championship Tournament of the International Archery Federation which was held in Paris, France, the first week of August, to determine the archery championships of the world.

Representatives from England, Poland, France, Belgium, Sweden, Czechoslovakia, Norway, Finland, Switzerland, and United States took part in this event. The men's championship was won by Monsieur De Rons of Belgium and the ladies' championship by Mrs. Simon of England.

The most important archery event in the United States during 1937 was the 57th Annual Championship Tournament of the National Archery Association held at Lancaster, Pa., July 19-23, with 178 archers participating. The winners and their scores were: men's championship, Russ Hoogerhyde, Northbrook, Ill., Double York 268-1496, Double American 179-1369; ladies' championship, Miss Jean A. Tenney, Clear Spring, Md., Double National 141-859, Double Columbia 143-1097; junior champions, Robert Goldrich, Newtonville, Mass., Double Junior American 180-1286 (a new record) and Marian Sturm, Indianapolis, Ind. A record shot of 355yds. was made by Mrs. Millie Hill, Dayton, Ohio, in the Ladies' Flight Shoot.

Over 700 students from 72 colleges took part in the Eighth Annual Women's Inter-Collegiate contest which was won by the first team from Los Angeles Junior College, Los Angeles, Calif.

During 1937 a hunting preserve for the exclusive use of archers hunting with the bow and arrow was set aside in Pennsylvania. Similar hunting preserves also exist in Ohio, Indiana and Oregon. Of the 300 or more archery clubs in the United States about 200 are using ranges provided by municipalities on public recreational fields. (L. C. S.)

**Architects, American Institute of:** see AMERICAN INSTITUTE OF ARCHITECTS.

**Architecture.** The critical observer studying the architecture of Europe and the Americas as evidenced by the buildings which were finished in 1937, will note certain things:—many new materials, especially in interiors; some new methods of construction, especially in prefabrication; remarkable simplicity in form; little use of ornament, but the decorative employment of strong contrasting colours both on façades and interiors; brilliant, rustless metals; extensive use of glass in a great variety of forms; and all of these elements combined into strange shapes and masses which, when compared with the older surrounding buildings, would indicate either a revolution in architectural thinking or an evolution which has come over us so rapidly that it amounts to the same thing.

Several factors are responsible for this apparently rapid change. Not the least of these is the fact that the total amount of building in the last ten years has been relatively small, compared to the preceding decade. The new buildings are, therefore, conspicuous because of their apparent isolation.

**Materials.**—Strictly speaking, no new idea has appeared in construction which is fundamental, but standardization of parts made by machine on a mass production basis is becoming daily an increasingly important factor in architectural design. For instance, in the construction of Rockefeller Center in New York, a single contract for 28,000 identical windows was given out. It is also a result of this machine age that there appear to be many new and, for the moment, novel materials available for building use. These have often been called, for lack of a broader term, "synthetic" materials, meaning those made by machinery, chemistry or metallurgy rather than carved or shaped out of nature's products. Making building substances is not a new idea, but so many substances are being put on the market at present, and at such a rapid rate, that they seem to be new materials. We do not think of brick—a product which has been in use since the days of the Egyptians—as a "synthetic" material, yet it is "made" by artificially baking clay. But the public as well as architects are not

accustomed to the idea of developing materials to specification so that there are some mental adjustments to make, and architects need to acquire a great deal of technical knowledge in order to use "synthetic" materials properly and develop efficient building techniques for handling them.

Important among these recently developed materials are plastics, the chemically developed resinous substances impervious to moisture, remarkably rigid, offering a wide range of colour, and surface textures grading all the way from a highly polished mirror surface to moulded forms of wide variety.

Another material, glass, although familiar as it has been used in the arts for centuries and as it is constantly used now for windows, tableware and mirrors, is a new building material in the forms which adapt it for use as a wall surface. Formed in the shape of brick or of rectangular panels, varying in thickness from an inch to several inches, it is used in combination with metal bracing for interior partition work where it is necessary to prevent sound passing from space to space, yet where the passage of light is desired. It is also being used in thick blocks for exterior walls, serving in this case as the very structure itself. It is completely non-absorbent, highly resistant to heat and cold, very sanitary since it can be kept clean easily, and, when used on exteriors in smoky cities, seems to wash itself. Sometimes it is used in a translucent form to admit light to the interior; sometimes in an opaque form simply as an exterior wall.

Special metal alloys are coming into increasing use, typically the rustless metals. These are industrially produced alloys as distinguished from the metals to which we are more accustomed such as iron, steel, copper, etc., and, unlike them, are able to maintain their lustre and original colour without deterioration. All such alloys are beginning to play an important rôle both structurally and ornamentally. Finally, the older materials themselves—stone, marble, wood, terra cotta, brick—are being used differently since the designer must consider machine production rather than hand production as a basis of his ornamentation.

In the structural field, there have been technical improvements in methods of assembling the steel skeleton which is now almost universally adopted as the weight bearing structure of the larger buildings. Assembly by riveting—a process which always annoys the whole neighbourhood with the racket made by the pneumatic riveter—is now being replaced by electric welding with no more noise than the low hum of the motor that generates the current.

Methods of utilizing concrete for floors, roofs, and walls have also been improved. Concrete is being manufactured in large interlocking slabs, the necessary drying out having been done in the factory under perfectly controllable conditions. By using such slabs, floors, roofs and walls are erected much more quickly and easily and without the subsequent loss of time for drying out that follows the customary usage of concrete.

**"Functionalism."**—Previous to the World War, there had been growing up in Europe, notably in Germany, Austria and the Scandinavian countries, a new school of architecture. A younger group was reluctant to accept the academic standards to which contemporary architecture was expected to conform. It therefore submitted these architectural conventions to a careful scrutiny, and compared them with structural requirements as understood by the engineers and contractors. The fact thus came to light, that structural requirements, *i.e.* "functional" plan, more often conflicted than harmonized with the "architectural" design of a building. With simple good sense, therefore, these architects, perceiving additionally, that one reason for this state of affairs was the rapid progress which science had enabled engineering to make, proceeded to put the "horse before the cart" at least long enough to find out what kind of architectural thinking was appropriate to scientific engineering. The interesting period of "functionalism"

Upper left—NEWEST EUROPEAN RAILWAY STATION, at Florence, Italy, impressively adapts simplicity of design to the spaciousness of a public building

Upper right—ST. MONICA'S CHURCH at Bootle, near Liverpool, England

Lower left—FLAT BUILDING at Highgate, Highpoint, London, designed for a maximum of sunlight and air and full recreational use of roof space

Lower right—HALL IN ROCKEFELLER CENTER, New York city, where architectural details emphasize the commercial purposes of the building

has much solid accomplishment to its credit, whatever the somewhat emotional controversies it inadvertently caused.

The year 1937 shows by many examples that "modern" architecture has been accepted by the public. Just how well established it actually is, and to what degree it is indicative of a trend which will be realized in the buildings of the future, remains a question. Change itself seems to be occurring much more rapidly in all phases of life so that still other and different approaches to the architectural problem may develop in this next decade. The following discussion of examples illustrates this point.

**Paris Exposition.**—With a few exceptions, the exhibits of the Paris Exposition of 1937 present a representative cross-section of national trends in architecture, because there are over 40 national buildings included as exhibits. The most impressive though by no means the most admirable specimens are those of Germany and Russia. It is interesting to note that both buildings—antagonistic though their Governments are and different as their architectural plans at first glance appear to be—achieve an almost identical effect of aggressive, massive force. Doubtless this is, partially at least, the effect desired by both, and it results from taking similar liberties with scale and other design relations. The German building adapts classic modes to its own ends. The Russian building is a streamlined pedestal for an out-size statue of two workers. The most sympathetic critic who has any understanding of architecture is forced to conclude that however beneficial heavy handed Government may be for the public soul, it is demoralizing to public architecture. The buildings are not modern, unless simply taking liberties with previously accepted concepts is enough to "modernize" them.

There is a certain confusion between modern and modernized apparent throughout the exposition. It is particularly obvious in exhibits such as those of Rumania and Hungary where the buildings are really romantic in character, true enough to the mediaevalism that is typical of their historic architecture, but sterilized as to detail in the manner that is associated with modern work. As a way of being modern, these exhibits differ from those of Germany and Russia by a successful willingness to be pleasant, and there is no justification for believing that this particular phase of contemporary architecture is less significant—as far as indicating the trend of the future—than the more radical phases. The emotional connotations of a mode of architecture are a vital—if not the most vital—factor in determining its acceptance at a given time.

There are two buildings that fully merit credit as fine design, and which are genuine examples of the modern approach in architectural thinking. These are the Austrian exhibit and that of Yugoslavia. The Austrian building is thoroughly competent and possesses the same quality of distinction as the work of the American architects McKim, Mead and White—probably for the same reason, *i.e.* a theory clearly conceived and a thorough knowledge of all the materials used, including those that are simply architectural ideas.

The Yugoslavian building likewise arrests attention by the quietness and sureness of its claim. A simplicity which includes both charm and "good taste" becomes almost dramatic situated as it is in a gathering of buildings which are on the whole restless and aggressive.

Of equal interest are the permanent buildings, the Trocadero and the Palace of Modern Art. The Trocadero is classic in its proportions, the orderly sequence of motives used and its symmetry on a broad scale, but it is classic with none of the usual details formerly associated with this style. In the case of the Palace of Modern Art, regard for perfect balance is not stressed to such a degree. There is unusual freedom in the plan arrangement with an interesting play of changing levels as one passes

from terrace to terrace in the forecourt of the building, then as one moves from gallery to gallery in the interior.

It is to be assumed that the crudity noted in some of the national exhibits is a perfectly normal symptom of a confused but earnest effort to adjust architectural thinking to rapidly changing social conditions, and that irrelevant inconsistencies will be eliminated and details more carefully studied as the mode develops. The buildings of Finland, Sweden, Great Britain, Czechoslovakia, Canada, Denmark and the United States all are typical of various aspects of the modern trend, and are sufficiently rational experiments. Finland, using corrugated iron vertically as a decorative surface, indicates the possibilities inherent in materials once they are considered objectively, apart from the ideas which have become attached to them. Sweden raises the question as to how necessary it may be to conceal construction members. Czechoslovakia gives a simple but convincing use of glass walls and, like Portugal, manages to do so in terms of pleasing and well integrated detail relationships. Great Britain and the United States, without in either case achieving a design of great distinction, are important for indicating quantitatively the radical ideas activating the whole movement.

Whatever the quality of the design displayed there, the Paris exposition makes it clear that the functional concept has been accepted in principle by the exhibiting countries, and the variations are due partly to national differences in politics, history and temperament, partly to the fact that modern building to date has perforce been primarily experimental. Time is needed to prove which have been the most practical and acceptable ways of solving various architectural problems.

Among the interesting private developments of 1937 are the apartments at Highgate, London. These do more than demonstrate functionalism in plan, construction and character of design. By meticulous attention to details, they make a very subtle and convincing demonstration of the degree to which the modern school of thought has become established. The fact that the potentialities of modern technics are utilized not merely to effect economies, but to realize, by conscious exactness a self-consistent precision in design, is evidence of that intelligent study and apt utilization of the machine which will find and express the particular form of beauty intrinsic to it. The Highpoint apartments are, therefore, not only a conscientious and very successful solution of a particularly difficult variety of architectural problem, but a challenge, as well, to those who regard modern design as a superficial style.

It is interesting, as a matter of comparison, to consider the Rockefeller apartments in New York city, which are roughly equivalent in intention, and also the Williamsburg housing project in Brooklyn, New York. The interiors and floor plans of the former are noteworthy for their attractive simplicity. (*See HOUSING.*)

A different type of problem and one in which design is less limited by economic considerations, is solved most admirably in the Florence railway station, Italy. While strictly functional in plan, construction and concept, the very nature of the problem permits a monumentalism of which the architects have taken full advantage. Although subjected to criticism by those whose usual ways of thinking about architecture have been jarred, the point of great significance about this particular edifice is the fact that it is a true continuum of the grand manner typical of Italian architecture.

It is unmistakably Italian in spirit, unmistakably the modern architectural equivalent of a Renaissance palace.

In the same way Rockefeller Center, to which a new unit was added in 1937, is typical of what is most characteristically American in architecture.

(H. W. C.)

**Arctic Exploration.** The most notable achievements of 1937 have resulted from that general Soviet program of northward expansion which in 1932 was consolidated as the Chief Administration of the Northern Sea Route, which under Professor Otto Yulievich Schmidt, dominates all Soviet lands and seas north of  $56^{\circ}\text{N. Lat.}$  During 1937 they have reached a total of 57 in their arctic scientific stations, some of which have staffs comparable to the faculty of a small college, with a wide research schedule, while others are largely confined to the observation and wireless reporting of weather conditions and ice movement. The scientific and developmental program of which these stations are a visible sign is developing in many directions.

In 1932, for the first time a vessel, the "Sibiriakov," negotiated the entire North-east passage in one navigation season. In 1935, 100 vessels traversed parts of the route, carrying 204,000 tons of freight, while four freighters completed the passage; in 1936, 160 ships carried cargo along portions of the route, and fourteen vessels made through runs. Figures for 1937 are not yet available. (Jan. 1, 1938.)

Two countries are most notable in their use of planes beyond the arctic circle, Canada and the Soviet Union. A Canadian estimate is that some thirty aeroplanes flew within the Canadian arctic during the year. A Soviet authority has it that about 300 aeroplanes were constantly employed within their arctic. Ten regular airlines were in operation, with a mileage of nearly 7,500 miles. The Soviets have numerous air bases within the arctic, most of them on the mainland but three or more on islands to the north of Siberia. The most northerly is at Rudolf island, near  $81^{\circ}50'\text{N. Lat.}, 58^{\circ}\text{E. Long.}$

**Polar Landings.**—After a reconnoitering flight to the North Pole on May 5 by Pavel Golovin, a landing at the Pole was made on May 21 by a four-engined plane. In command was Professor Schmidt, the pilot was Mikhail V. Vodopyanov, and there were three others. They came from Rudolf island, which they had reached by aeroplane. On radio report that they had landed safely, three other four-engined planes arrived with supplies. In the operation at least nine successful descents and take-offs at different points were made. The planes returned to Moscow leaving encamped on a stout floe Ivan Papanin, leader, Ernest Krenkel, Pyotr Shirshov and Eugene Feodorov. The camp has drifted at an average rate of more than three miles per day towards the Atlantic, and on Dec. 31, 1937 they had reached  $\text{Lat. } 80^{\circ}0'\text{N.}, \text{Long. } 6^{\circ}59'\text{W.}$  The direction of drift was expected but the rate has exceeded most predictions. The sounding taken near the North Pole of 4,290 metres (14,070ft.) is in conformity with Peary's no bottom of 9,000ft., taken also near the Pole in 1909. The weather report included summer rains. A fundamental oceanographic controversy appears to be settled by Papanin's radio dispatch of July 3, 1937: "... the investigations ... have disproved Nansen's conjecture that the central part of the Arctic ocean holds extremely little life. A net raised from a depth of 1,000 metres fairly teemed with diverse molluscs, larvae, medusae, and crustacea."

Other dispatches have mentioned, while still right by the North Pole, visits by seven kinds of birds and by a mother polar bear with her two cubs. In the leads were crustaceans moving near the surface and seals swimming about and gulping them down.

After the world was startled by the news that Soviet arctic scientific station No. 56 had been established at the North Pole, came a similar announcement that station No. 57 had been established on Henrietta island. This had been discovered by the American George W. De Long in 1881, and is particularly important for predicting the weather of the American territory of Alaska, as is also Wrangel island (discovered by Captain Henry

Kellett of the British Navy in 1849). The Soviet Government now maintains scientific stations on every group of their Arctic islands, and colonies with schools and hospitals on some of them.

In trans-Arctic flying, and in long distance flying by way of the Arctic, there were three notable Soviet endeavours. Between June 17 and 20 Valeri Chkalov, Georgi Baidukov and Alexander Beliaikov, in a single-engined monoplane, flew non-stop from Moscow by way of the Pole to Vancouver, Wash., encountering their chief difficulties not over the Arctic sea but over the continent of North America and the worst of them after reaching the United States. Between July 11 and 14 this flight was repeated, and excelled in distance, by Mikhail Gromov, Andrei Yumashev and Sergei Danilin, who, again from Moscow by way of the Pole, reached San Jacinto, Calif. a certified mileage of 6,295.662, exceeding the previous long distance record by 638.275 miles.

**Soviet Fliers.**—August 12 the most famous aviator of the Soviet Union, Sigismund Levanevsky, left Moscow with five companions in a four-engined passenger-type plane, destination Fairbanks, Alaska. All went normally till he had reached the North Pole and flown perhaps 100–200 miles to the Alaska side of it. Then came the first sign of difficulty and the last message that for certain was received from his plane. It was to the effect that, while they had been flying previously at 6,000 metres in clear air above clouds, they had now been forced down to 4,600 metres, and into clouds, by the failure of one of their engines, and that ice was forming on the plane. This flight was not only at a very foggy season but at a time when the numerous previously level ice fields, suitable for emergency landing, had been cut up by summer rains and thaw water so that nothing better could be expected than a "pancake" landing which would destroy the undercarriage without seriously injuring the crew.

Assuming this type of landing, searches were immediately organized, both from the Old World and the New. The Soviets' own relief operations were so numerous and complicated, and have as yet been so incompletely reported, that we cannot describe them, and notice only one series of journeys which combined heartening international co-operation with notable flight accomplishment, that in which Captain Sir Hubert Wilkins, Air Commodore Herbert Hollick-Kenyon, relief pilot Silas Alward Cheesman, radio operator Raymond Booth and mechanic Gerald Brown, flew in an American flying-boat of 4,000-mile range a total of 13,000 miles over the polar sea, in five voyages between Aug. 23 and Sept. 21, highest latitude  $87^{\circ}10'$  in W. Long.  $148^{\circ}$ . Before mid-winter Soviet relief planes equipped with skis or wheels assembled at Rudolf island, on the European side, and the Wilkins party again took the field on the American side with a twin-engined plane mounted on skis. The plan from both sides is to search by moonlight during mid-winter, beginning with the January full moon; from late February the flights will have daylight, which becomes perpetual over the search area in March. The operations should continue at least until fogs become a serious handicap, in May or June.

**Weather Forecasting.**—The search for Levanevsky brought about international co-operation between scientific organizations and governmental departments of the United States, Canada and the Soviet Union, co-ordinated by the Explorers club of New York city. From this co-operation have come practical results, among them an increased accuracy in weather forecasting, particularly noticeable for Alaska and the Pacific coast of North America, but considerable for the whole continent as far east as the Atlantic seaboard.

Also of importance in forecasting are the weather reports sent out by the Arctic wireless stations of the United States army from Alaska and of the Canadian Government from the north coast of Canada and from Hudson Bay.

During the summer 1937 supplies were freighted via the North-west passage for the first time; goods coming from the west met the Hudson's Bay Company's supply ship coming from the east via Bellot strait—the first time a ship had traversed the strait. No one has yet made the entire North-west passage in one season.

**British Expeditions.**—Several small British expeditions are working in the eastern section of the Canadian arctic. One, the Canadian Arctic Expedition of 1936–39, under the leadership of T. H. Manning, studies the western shores of Hudson Bay from Southampton island northward, and the west coast of Baffin island. Four out of five of the members of the expedition have returned to England, leaving Manning to work alone. The British Arctic Expedition 1937–38, commanded by D. Haig-Thomas, with its main base at Thule, North-west Greenland, plans a survey journey down the east coast of Ellesmere island. R. Bentham's one-man expedition (British) carried on geological investigations in the southern portion of Ellesmere island.

J. M. Wordie (British) cruised to southern Ellesmere island and Baffin island; a rapid survey was made along the north-east coast of Baffin island. There were experiments with miniature balloons for the study of cosmic rays in the neighbourhood of the Magnetic Pole. A large archaeological collection was obtained by excavation in ancient Eskimo settlements.

An American expedition, commanded by Clifford J. MacGregor, was established at Reindeer point, near Etah, Greenland, with purposes chiefly meteorological. A summary of the weather is forwarded to Washington twice daily. Miss Louise Boyd, American explorer, continued the northern work which she has been doing for the last eleven years, sailing in June for Greenland to make studies of the undersea shelf believed to connect North-east Greenland and Spitsbergen.

For the first time in several years a whaling fleet operated in the Arctic, in the waters between Greenland and Franz Josef. Commercially successful coal mines are being worked in Spitsbergen on a scale of more than half a million tons per year. The economic developments of the Soviet arctic to the east, from Spitsbergen to Bering straits are so extensive as to be bewildering.

Mapping and scientific studies were carried on in Greenland, chiefly by Danish and Norwegian expeditions, but also by scientists of several other nationalities. Denmark continues to maintain Greenland as a legally closed country and carries forward its benevolent, medical and other work on behalf of the Eskimos. There are considerable economic developments, as, for instance, the expansion of sheep farming, which is now well beyond the 10,000 head limit, and the encouragement of fisheries, such as the special facilities given to Faroese fishing ships on the West coast. (See EXPLORATION AND DISCOVERY.) (V. S.)

## Areas and Populations of the Countries

**of the World.** The table that follows gives the latest known figures of the area in square miles, the population in thousands and the population per square mile of the different countries of the world.

Name of State	Area (in Square Miles)	Population (1,000's omitted)	Population per Square Mile
Afghanistan . . . . .	c. 245,000	c. 11,000	c. 48

NOTE.—All the above-named States are members of the League of Nations, with the exception of those marked \*, which have never acceded, and those marked †, which have resigned membership; Guatemala, Honduras, Italy, Salvador and Nicaragua (marked §) have also announced their withdrawal from the League, the withdrawals becoming effective respectively on May 13, 1938, June 22, 1938, Dec. 11, 1939, Aug. 11, 1939, and June 26, 1938.

‡Burma's membership of the League is, for the present, covered by that of India.

**Argentina,** second largest country in South America, a republic, on the Atlantic coast of Southern South America; language, Spanish; capital, Buenos Aires; president, Agustín P. Justo; president-elect, Roberto M. Ortiz (takes office Feb. 20, 1938).

**Area and Population.**—The area is 1,079,965 sq.mi., approximately a third of that of the United States. There has been no official census since 1914, when the population was 7,885,000. Official estimate (Dec. 31, 1936), 12,561,361, with 76.9% native-born of European stock, 3.2% mixed blood, 19.9% foreign-born (practically entirely European). The country has a larger percentage of white population than any other American country except Canada. The bulk of the population is of Spanish blood, with an important Italian element unofficially estimated at 35%. Immigration in 1936 totalled 47,633, and was estimated at 38,000 for the first nine months of 1937. As a result of immigration and colonization

conventions made during 1937 with Denmark, the Netherlands, and Switzerland, a substantial increase in immigration is expected. These immigrants will go especially to the Andean valleys of the far south, where colonization was especially emphasized during 1937. The chief cities, with estimated 1936 populations, were: Buenos Aires, 2,388,654 (approximately 3,500,000 including suburbs); Rosario, 507,784; Córdoba, 238,300; Avellaneda (a suburb of Buenos Aires), 214,566; La Plata, 190,577; Santa Fé, 125,295; Tucumán, 123,572. Twenty-eight other cities have populations in excess of 25,000.

**History.**—Argentina has a federal form of government, with legislative powers vested in a congress. During the year 1937 no legislation of far-reaching importance was enacted, due to the fact that it was a year of presidential elections, and Congress, when it convened May 13, was engaged chiefly in political activities. In general, the legislative program of President Justo's last year in office was to carry forward his policies of previous years. Legislation for land settlement colonization to be financed by the Government, and for minimum wages, maximum hours, and regulation of working conditions was introduced.

On June 23, Dr. Roberto M. Ortiz, minister of Finance, and Dr. Ramón S. Castillo, minister of the Interior, resigned to become, respectively, presidential and vice-presidential candidates of the "Concordancia," or Government coalition, at the September elections. In the campaign, they were opposed by the Radical Party, headed by former President Marcelo T. de Alvear. In the September elections, Dr. Ortiz won by an electoral vote of 248 to 128 (popular vote: Ortiz, 1,093,928; Alvear, 815,053) and will take office for a six-year term beginning Feb. 1938.

In April the assassination of Josef Riedel, Argentine leader of German Nazi activities, in Buenos Aires, roused strong feeling and caused representations to be made by Germany. The offer of the United States, in July, to lease naval vessels to Brazil and other Hispanic-American states for training purposes (*see* BRAZIL) stirred great opposition in Argentina and was front page newspaper material for weeks.

During the course of 1937, Argentina made several important commercial treaties and began negotiations with the United States for tariff reciprocity. Trade agreements were made with Czechoslovakia, Germany, Italy, and the Netherlands. A temporary *modus vivendi* with Peru terminated a serious trade dispute of several years standing and pointed the way to a definite treaty. A tripartite agreement with Bolivia and Paraguay for commissions to develop further trade relations among the three countries was signed in February. In June the Senate ratified eight Pan-American peace treaties, the outgrowth of the Buenos Aires conference of Dec. 1936.

**Trade and Communications.**—Argentina's foreign trade in 1936 aggregated: exports, 1,652,448,651 pesos (for value of the peso, see below); imports, 1,168,210,827, a 5% increase over 1935. The rise in value was due in part to higher prices on all principal export commodities except cereals and to the generally improved economic condition of the country. Four main classifications of commodities made up the bulk of the exports: cereals and linseed, 52.1%; meat, 16.2%; wool, 9.16%; hides, 7%. Great Britain took 31.8% of the entire exports, a substantial increase; the United States, 10.5%; with the Netherlands, Belgium, Brazil, and Germany following. Great Britain likewise led in supplying imports, with 20.4%; the United States, 14.6%; Germany, 9.2%; Belgium, 6.4%; Italy, 5.2%; and Brazil, 4.8%. The largest single group of imports was textiles and manufactures (24.4%), followed by fuel and lubricants (16.4%), iron and steel and manufactures (11.35%), and machinery and vehicles (9.3%).

Argentine foreign trade increased notably in 1937. Imports were estimated to be nearly 40% and exports 49.5% greater than

in 1936. This was caused principally by increased shipments of cereals, which in turn brought about a sharp rise in bread prices, so that on Oct. 29, the Government forbade wheat and wheat flour export until the new harvest. Great Britain continued to hold first place in this period, but her proportion of exports had fallen from 34.9% to 26%, and from 21.3% to 19.6% of imports, while the United States, continuing as second, had increased her position, taking 13.5% of exports and supplying 16.4% of imports against 11.5% and 14.8% in the corresponding period of 1936. For the first ten months, Argentina's exports to the United States were the highest ever recorded, reaching a value of 1,288,671,000 pesos (\$429,570,000 U.S.). In October, for the first time since 1928, the United States led Great Britain in exports.

By far the greater part of Argentine external commerce is handled through Buenos Aires, which is served by numerous steamship lines. Late in 1937 it was announced that additional rapid steamer service from the United States would be added in Jan. 1938. Bahia Blanca is important for the export of agricultural and pastoral products from Northern Patagonia and the Southern Pampas region and for the importation of bulky commodities such as lumber into the same area; Rosario, on the Paraná, similarly serves the river provinces, while Rivadavia, in Southern Patagonia, is important for the growing oil industry. Regular air communications are maintained with Chile and with Uruguay and Brazil, and through them with all parts of the American continent, besides domestic services which link together the more distant parts of the country. During 1937, weekly service to Tierra del Fuego was authorized.

Argentina has 40,642kms. of railway lines, of which 9,264 are Government-owned. In November, the Government took over an additional 1,960kms. for a one-year period. By decree of Feb. 12, 1937, the Government authorized the reconstruction of the Trans-Andean Railway, inoperative since Jan. 11, 1934, when landslides blocked it. A maximum cost of 5,614,489 pesos was set. Resumption of service would revive a trade with Chile which formerly took 66,000 head of cattle annually. Argentina has almost half the total of telegraph and telephone lines in South America, approximately 315,000,000 kilometres. The country is traversed by approximately 300,000mi. of roads of various types. The national highway program adopted in 1932 was continued in 1937. This calls for construction of a network of 30,000mi. of national highway, at Federal Government expense, and some 600,000mi. of secondary highways constructed by the provinces with aid from the Central Government. Toward this end, annual expenditures of some 100,000,000 pesos, of which about half comes from a gasoline tax, are being made. Present construction will bring the total of national highway mileage to 22,237 by the middle of 1938, including a 2,000-mi. highway to Tierra del Fuego. Eventually, this network will connect with the international Pan-American highway system.

**Agriculture, Manufactures, Mining.**—Argentine resources are primarily agricultural and pastoral. Timber resources are very limited except in the sub-tropical north, where the quebracho, source of tannin, has been extensively developed (with a production of 21,488,615 tons in 1935), so that Argentina supplies two-thirds of the world output; maté (Paraguay tea) is also produced in large quantities chiefly for domestic consumption. The country lacks great mineral wealth other than petroleum. Manufacturing is developing rapidly, but is in no way adequate to supply domestic needs. About 10.75% of the area of the entire country is under cultivation; while 34.4% is devoted to the pastoral industry.

The chief agricultural production is in cereals and linseed. The latter production is the world's largest. In 1935-36, the production of principal commodities (in metric tons) was: wheat,

3,800,000; linseed, 1,330,200; corn, 9,969,627; oats, 510,000; barley, 460,000; rye, 127,000. Production of sunflower seed, valuable for vegetable oil, totalled 46,000 tons containing 9,900 tons of oil. Cotton production has undergone a rapid development in recent years with 308,834 hectares (1 hectare equals 2.47 acres) under cultivation in 1936, and a production of 80,957 metric tons. Because of drought conditions the 1937 crop was only 31,170 tons. In 1937, 477,900 hectares were planted in cotton for the 1937-38 crop, an increase of over 67,000 hectares.

Crop reports from Argentina in Nov. 1937 indicated a sharp decrease in cereal output, especially in wheat, due to heavy frosts; and it was prophesied that the wheat crop would be the smallest, with two exceptions, in fifteen years, with an estimated yield of 185,000,000 to 195,000,000 bu. compared with 247,000,000 bu. in 1936. Argentina, in 1934, had 30,867,852 head of cattle, 39,329,781 of sheep, 3,768,738 of swine.

In 1935 a comprehensive industrial census was taken; provisional statistics made public in 1937 showed the following: 40,367 industrial establishments, employing 464,725 labourers and 49,198 administrative and technical employees, who received 733,985,740 pesos compensation in the year ending June 30, 1935. The value of raw materials used totalled 1,960,445,754 pesos with resulting manufactured goods valued at 3,442,408,296 pesos. Industrial activity was largely in foodstuffs, involving 11,564 establishments, with 120,902 employees, 897,093,422 pesos value of raw materials, and 1,267,118,133 pesos value of finished goods. Of principal importance among them were the meat-packing houses, who employed 27,663 persons to produce products valued at 440,030,565 pesos. This and the quebracho industry are the only ones producing commodities entering extensively into foreign trade. A small shipbuilding industry exists, and in April 1937, the oil-tanker "Presidente Figueroa Alcorta," said to be the largest vessel ever built in South America, was launched.

Argentina ranks eleventh in world production of petroleum, with an output estimated at 15,550,000 bbls. in the year ending Oct. 31, 1937. The chief fields are in the vicinity of Rivadavia (Patagonia) and are, in the main, Government-owned.

**Finances and Banking.**—The monetary unit is the paper peso (official value 33¢ U.S.; free value approximately 30¢ U.S.). Argentina has the highest credit of any Hispanic-American country. No bonds of the Central Government are in default, although several provinces have suspended interest payments. On Dec. 31, 1936, the latest date for which official figures are available, the total funded debt of Argentina was 4,153,020,336 pesos, of which 1,631,225,031 pesos was in foreign currency (including 228,454,953 pesos in dollar bonds). The floating debt at the same time was estimated at 81,037,325 pesos. The total revenues, according to official provisional figures for 1936, were 1,043,000,000 pesos. For the third year in succession the budget was balanced in 1936, with a total of 873,300,000 pesos. The budget for 1937 was reduced to 833,900,000 pesos.

**Education and Religion.**—Along educational and collateral lines, Argentina is one of the most advanced of all Hispanic-American countries. The country had, in 1936, 12,867 schools, with 1,882,791 enrolment, maintained at a cost of 242,148,900 pesos. More is spent per pupil than in any other Hispanic-American country, almost twice that in the second country (Chile). The universities, especially those of Buenos Aires and La Plata, have high international standing. The Roman Catholic Church is officially recognized by Argentina, but all sects are tolerated. Most of the population is Roman Catholic.

**Army and Navy.**—There is a regular army of approximately 30,000 men. Military service for one year, or naval for two years, is compulsory. The Argentine navy is the largest in South America. The Government has been actively enlarging the navy in recent

years. During 1937, seven new destroyers, built in Great Britain, were launched.

**BIBLIOGRAPHY.**—Ricardo Levene, *A History of Argentina* (tr. by W. S. Robertson), Chapel Hill, N. C., 1937. (L. W. BE.)

**Arizona.** Arizona, one of the two youngest of the American States, was admitted with New Mexico in 1912; area, 113,956 sq. mi.; population according to the U.S. census of 1930, 435,573. Restricted output of mines and smelters caused decrease to approximately 406,000 in 1937. The capital is Phoenix, 48,118. Of the population 264,378 were native and foreign-born white, 10,749 coloured, and 160,446 other races, chiefly Mexican and Indian.

**History.**—The State officials, 1937, were Chief Justice A. G. McAlister, Governor R. C. Stanford, Secretary of State J. H. Kerby, Attorney General J. Conway, Treasurer H. M. Moore, Auditor Ana Frohmiller, Superintendent of Public Instruction H. E. Hendrix. Governor Stanford, nominated by the less con-

RAWGHLIE STANFORD, governor of Arizona

servative wing of the Democratic Party entered office January 1937. The entire legislature was Democratic with one exception. The Governor's chief plank was his proposal to increase taxes on mines and railroads and to reduce the sales tax by a corresponding amount, foodstuffs, fuel, and cheaper clothing to be eliminated entirely from the sales tax. The failure of the civil service measure to pass was a disap-

pointment to those interested in more efficient government. Owing to conflicting interests within the legislature and also to those between the legislature and the executive three special sessions were called, the last adjourning Aug. 4. The first convened May 10 to deal with the administration's tax program, since the Governor had not sufficient strength to permit its introduction in the regular session. The Governor's sole victory in the special session was the provision that 60% of the sales tax be returned to the counties to relieve them of depression-caused debts.

**Education.**—The University of Arizona is located at Tucson and the two teachers colleges at Tempe and Flagstaff. The last two institutions were empowered by the legislature of 1937 to grant the A.B. and B.S. degrees. In 1937 the appropriation for the three institutions for a two-year period was \$2,671,107.35. For a number of years Arizona has had no institution for delinquent girls, private institutions having taken that responsibility. The Boys Industrial school at Fort Grant has been notorious for poor equipment and inadequate appropriations, likewise the State Penitentiary, Florence, housing twice the number of inmates for which the buildings were planned.

**Charities.**—In Oct. 1937 there were 16,645 cases or families receiving some form of public aid with a total monthly expenditure of \$648,930.92. The November expenditure was slightly less.

**Agriculture and Mining.**—Citrus fruit, cotton, lettuce, and beef cattle comprise three-fourths of the value of the agricultural products of Arizona. In January 1937, the coldest in twenty-four years, 80% of the fruit that still remained on the trees was destroyed by frost. In the fall of 1937 the crop in the orchards was estimated at 2,300,000 boxes of grapefruit and 300,000 boxes of oranges, Arizona ranking third State in the production of grape-

fruit. The cotton crop for 1937, the largest in history, amounted to 280,000 bales from as many acres. Arizona produced one-fourth of the commercial lettuce raised in the U.S., the harvest ending April 1937 amounting to 10,500 carloads taken from 31,000 acres. The beef cattle of the State number approximately 900,000 produced on grazing lands and later fed for the market.

Copper production, at the peak of the market in March, was estimated as normal. With the decline in price in the autumn of 1937 Phelps Dodge cut its production about 33% and Inspiration 70%. The value of the production for the year has been estimated at about \$45,000,000. (H. A. H.)

**Arkansas**, twenty-fifth State of the United States, popularly known as the "Bear State"; area, 53,335 sq.mi., population (U.S. census, 1930), 1,854,482; (estimate July 1, 1937), 2,048,000. Capital, Little Rock, 81,679; the next largest city is Fort Smith, 31,429. Hot Springs, a well known health resort, has 20,238. The rural population of the State (1930) was 1,471,604, or 79.4%. Of the total population 478,463 were coloured, 10,173, foreign born. State officials (1937): governor, Carl E. Bailey; lieutenant governor, Bob Bailey; secretary of State, C. G. Hall; attorney general, Jack Holt; comptroller, J. O. Goff.

**History.**—In the 1937 session of the legislature Governor Bailey had two main objectives in view, the refunding of the debt and the establishment of a merit system for office holders. Two such bills passed. The former never was utilized; the latter is regarded as one of the best civil service laws in the United States. Among other important laws passed at this session were those creating a State department of public welfare; prohibiting competition of prison labour with free labour; creating a commission for interstate co-operation; making the sales tax of 2% more comprehensive; providing for unemployment compensation; providing for soil conservation; revising the corrupt practices act; providing for the creation of housing authorities in cities of the first class; enacting a retirement act (contributory pension) for teachers; creating a State police. At the general election of 1936 an initiated act was adopted to improve judicial procedure and the criminal law, an act which the legislature had refused to pass. Also an initiated act to provide free textbooks through the eighth grade.

An amendment to the constitution exempts from State taxes homesteads up to \$1,000 and authorizes the legislature to raise the exemption to \$2,500. Another act took from the legislature the power of reapportionment and gave it to a commission consisting of the governor, the secretary of State, and the attorney general. The legislature had refused to reapportion for thirty years. An initiated act proposed an old age pension of \$50.00, but was ruled off the ballot because of defective title. It has been prepared for resubmission in 1938. A special election was called to fill the vacancy caused by the death of U.S. Senator Joseph T. Robinson. The State Central Democratic Committee nominated Governor Carl E. Bailey, but Representative John E. Miller won as an independent.

**Education.**—The public schools were hit hard by the depression and some were saved from closing only by Federal aid. In 1936 there were 3,505 grammar schools for whites and 1,293 for negroes with an enrolment of 292,805 and 106,802 respectively. There were 599 white high schools with 56,032 students and 77 negro high schools with 5,230. The preliminary report for 1937 indicated a slight increase in the white schools, a slight decrease in the negro schools. The total outlay for education in 1936 was \$11,073,498. The total for 1937 was approximately \$13,000,000. Fifty per cent of the sales tax, first laid in 1935, is devoted to education.

CARL E. BAILEY, governor of Arkansas

## Banking and Finance.

—On Jan. 1, 1938, 175 State banks and trust companies had a capital of \$7,799,000 and total resources of \$82,904,000 and 50 national banks had a capital of \$6,369,000 and total resources of \$109,993,000, the figures of both being slightly below those for the previous year. The State debt stood at \$145,603,167 on Dec. 31, 1937, a reduction of more than \$2,000,000

over the preceding year. Over 91% of the debt was incurred in building highways.

**Agriculture, Manufactures, Mineral Production.**—Agriculture is Arkansas' leading industry. Production for 1937 was considerably in excess of 1936, but low prices prevailed and the farm value was less. Benefit payments from the government, however, brought the total income above that of 1936. Crops valued at over \$5,000,000 were: 1,830,000 bales of cotton, \$74,115,000; 40,640,000bu. of corn, \$24,384,000; 814,000 tons of cottonseed, \$14,652,000; 969,000 tons of tame hay, \$9,302,000; and 9,342,000bu. of rice, \$5,325,000. During 1935 a total of 1,072 manufacturing concerns produced goods valued at \$122,447,739.

Lumber products led with a value of \$25,175,617 followed by petroleum refining with \$10,476,049. The estimated mineral production of the State for 1937 showed minerals valued at \$22,650,924, an increase of 16.53% over 1936. The three most valuable products—petroleum, coal and bauxite—maintained their 1936 positions. The value of petroleum, \$10,631,530, was the greatest; coal was second with \$3,837,471; and bauxite was valued at \$2,875,257. (D. Y. T.)

**Arkansas River:** see MISSISSIPPI RIVER SYSTEM.

**Armenian S. S. R.** A Transcaucasian republic, a member of the U.S.S.R. (*q.v.*) bordering on Georgia, Azerbaijan, Turkey, and Iran. The capital is Erevan, and the national flag has a red ground, with, in the top left corner, a gold hammer and sickle and the initials "Z.U.Z." Leading cities, with 1936 populations, are: Erevan 144,300, Leninakan (formerly Aleksandropol) 73,300 and Kirovakan (formerly Karaklis) 15,400. Area: 30,000 sq.km. Population (1933): 1,109,000 (rural 845,000, urban 264,000), 84.7% being Armenians, and 8.2% Turks. The total number of school children (1936-37) was 242,000, and there were 13 higher educational institutions with 5,000 students. On March 23 the Ninth Extraordinary Soviet Congress in Erevan adopted the new Armenian constitution. According to it, Armenia belongs directly, as an independent Union Republic, to the U.S.S.R. At the end of December a sensational anti-Trotskyist process began, at which eight leading personalities of the country were indicted. The main agrarian pursuits are: cotton and fruit (especially grapes) production, and animal breeding. The natural resources include copper, marble, and water power from the Sevan lake. The retail trade turnover (1936) was 0.5 milliard roubles, and the output of industry, 1936 (at prices 1926-27) was 180 million roubles.

The length of railways (1936) was 401km., and the freight carried was 2,307,000 tons. (S. YAK.)

a. 878,200 reserves on active duty shown under active army. b. Includes reserves. c. Excludes at least 5,000,000 unorganized but trained. d. July 1, 1936. e. 60,000 aviation; 40,000 anti-aircraft. f. Rough estimate; not included in total.

**Armies of the World.** The past two years have seen in most countries a crystallization of policy with respect to the size and type of army. Many details are still the subject of experimentation with consequent changes but the fundamentals are no longer a matter of doubt. This crystallization is due to a number of causes. First, the progressive failure of the world's peace machinery has forced even the most pacifistic countries to recognize the need for sufficient armament to insure protection of those policies essential to national security. Second, the experiments carried on in most countries have determined the powers and limitations of the newer weapons with their increased rate of fire, of gas, motorization, mechanization and aviation. Third, the war in Abyssinia against a semi-savage enemy occupying a difficult terrain, the Civil War in Spain and the operations of the modernly armed and equipped Japanese army over vast distances in China against all types of Chinese troops from poorly armed and equipped to reasonably first-class units, have given a wide opportunity to check on peace time experiments. Fourth, the new German army has taken definite form. The drastic German disarmament carried out as a result of the Versailles peace treaty gave Germany the opportunity to build a new army "from the ground up." The victors in the war of 1914–

18 have to first clear away the old structures before they can begin on a new.

The two most important questions concerning the proper organization of an army were caused by aviation and mechanization. They were: first, could aviation alone produce decisive results thus making large armies on the ground unnecessary and, second, could a large force of armoured and armed motor vehicles manned by a comparatively small number of highly trained military personnel cut through, destroy and defeat large bodies of infantry in the same manner as did the armoured knight in the heyday of feudalism?

**Aeroplanes and Tanks.**—During the World War the best type of weapons to be used against aeroplanes and tanks were not developed. Above all the necessary type of range finding and sighting apparatus did not exist. Today just as the development of adequate fire power proved to be the answer to the invincibility of the knight, the rapid and accurate fire quickly developed by anti-aircraft and anti-tank weapons has put aviation and tanks in a position such that they are less to be feared by well armed, well trained and well led infantry than was true in 1918.

The backbone of the new German army is the infantry. Each infantry division has, however, a far greater proportion of anti-aircraft and anti-tank weapons of all types as well as artillery than has ever before existed for the same number of infantry. It might be said that the infantry of a German division marches and fights surrounded on the ground and in the air by a hemisphere of fire. In fact, the development of fire by modern, well equipped, well trained, and well led infantry and artillery is so great that tanks need the assistance of this fire if they are to attack successfully.

In general the mission of aviation on land is:—first, when the opposing nations are close enough to make air raids to delay mobilization and concentration of the enemy's army, and to destroy war factories and supply centres; and second, to use its great powers of surprise attack to aid its own army on the ground. While deliberate attacks on civilian population with the intent of breaking a nation's morale are possible, such use of an air force is generally considered, aside from humanitarian grounds, of far less military value than the two purposes given above.

Besides aviation and tanks, the motor has caused three other changes in armies. One is the substitution in the cavalry of armoured cars and light speedy tanks for horses for reconnaissance and cavalry screen (to check enemy's reconnaissance groups from getting information concerning main body of the army) work. Two is the substitution of tractors for horse teams to haul artillery. Three is the transport of not only ammunition and supplies, but whole divisions complete by motor transportation. This motorization will permit even more drastic changes in strategy than those produced by the use of the railways on a large scale first in the American Civil War of 1861–65 and secondly by Von Moltke in 1870. Yet the horse has not yet disappeared from either the cavalry or field artillery as experimentation shows that in many terrains and circumstances he is of more use than mechanization.

**Chemical Warfare.**—Gas remains as during the World War a weapon of secondary importance. Up to the present there is nothing to justify the fear of its use to cause widespread destruction.

The constantly increased proportion of automatic weapons, of guns of all types, of mechanization and motorization and the considerable number of men on the ground needed to maintain planes in the air have greatly increased the proportion of specialists in all armies. In some countries the shortening of the term of service to 18 months or one year has had to be compensated for by an increase in the number of career or professional soldiers, if the training was not to deteriorate.

**Military Service.**—In all countries of any importance except the United States, the British Empire, and China, the army is raised by Universal Service. In the United States and the British Empire the armed forces are raised by voluntary enlistment. In China the different generals raise their own forces. For some years General Chiang Kai-shek has been trying to insure uniformity of training and equipment and to bring all generals under control of the Central Government. He has been, however, only partially successful.

The length of active service in the Universal Service armies varies from 65 days for Swiss infantry, engineers and foot artillery and but one month's training for probably 25% of the Russian army, to an average for most armies of two continuous years followed by various short periods from time to time while in the reserve. As the number of young men physically fit for military service each year in most countries exceeds the number which can be trained in the standing or active army, this excess is generally given short periods of training from time to time. This is particularly true in Russia. It is their basis for claiming a far larger number of trained reserves than those possessed by any other country. On the outbreak of war the trained reserves are used;—one, to bring the standing army to war strength; two, to mobilize new units made up of reservists, and three, to replace casualties. The British army service includes both active and reserve service. The U.S. army service is only active. Thus the U.S. army lacks even the enlisted reserves needed to bring it to war strength. It has an Officer's Reserve Corps.

In Italy, Germany and Japan boys and young men are given a certain amount of training before they reach the age of military service. In the United States besides private and State military schools, there are limited courses of military training in a number of colleges and each year camps at which a relatively small number of boys receive one month's training without obligation of service. In Britain there are Reserve Officer's Training Corps in a number of schools. In the U.S. the National Guard, a volunteer civilian military force, is armed and equipped and partially trained by the National Government. In Great Britain there is a similar force called the Territorials.

In Germany, besides the professional army, there are partially trained Black Shirts (12,000 are well trained and equipped), Brown Shirts, Technical Emergency Help Corps and a number of other Nazi-uniformed bodies. In Italy the Fascist militia which is partially trained has part of its force on active duty. In addition there are Railway, Port, Forestry, Highway, Anti-aircraft, Coast Defence and other militias.

**Infantry.**—The infantry division remains as during the war of 1914-18 the basic unit of all armies today. When that war broke out the standard type of infantry division consisted of two infantry brigades, each of two infantry regiments in turn composed of three battalions—of from 800-1,000 men. Each battalion was made up of four rifle companies. While the number varied somewhat, 36 field guns to 10,000-12,000 infantry or 1.33 guns per 1,000 infantry could be taken as an average proportion. During the war increasing difficulties in finding sufficient replacements for

existing infantry units coupled with the necessity of finding the personnel for the great increase in the proportion of machine guns to rifles, the introduction of automatic rifles, trench mortars and anti-tank guns; all led to a reduction in the number of infantry soldiers—in most of the infantry divisions of the French, British and German armies. This was generally accomplished by reducing the division from four to three regiments and each regiment from three battalions of four companies each to three of three companies each. Thus instead of 48 companies of infantry a division had 27 companies—a net loss of 21. As a rule the artillery per division of infantry was not decreased, with the result that the proportion of artillery to infantry increased. As the amount of Army Corps (two more infantry divisions to an Army Corps) and army (two or more Army Corps to an army) artillery steadily increased as did the artillery directly under the commanding general of each national army the proportion of artillery to infantry was greatly increased.

Post-war developments have steadily tended to increase the proportion of automatic weapons and guns of all types which now include trench mortars, anti-tank and anti-aircraft weapons as well as field guns and howitzers. Thus to prevent the infantry division from becoming too cumbersome to be handled as a unit by the Commanding General, a reduction in the number of infantry riflemen had to be made. The increasing use of motor transport to move the division also made a reduction advisable. Various methods of reduction have been advocated. A continuation of the war division of three regiments of infantry each of three battalions of three companies each is one method. Infantry battalions of four companies each but with a lesser number of men per regiment is another.

Today Japan is the only important country in which the Infantry Division still consists of two infantry brigades, each of two infantry regiments made up of three or four-company battalions. France, Germany and Russia have suppressed the infantry brigade. Each has three regiments of infantry to the division. Great Britain from the days of the Cardwell reorganization has used a battalion instead of a regiment as the tactical unit. Four battalions grouped together constitute a brigade. It is commanded by a Colonel with the temporary rank of Brigadier General. Three of these brigades constitute an infantry division. The organization of an infantry division is being experimented with in the United States with particular reference to insuring mobility for the whole division by means of motorization and mechanization. The probabilities are that this will lead to the replacement of the present division of two infantry brigades, each of two regiments, each of three to four-company battalions by one of three infantry regiments, each of three or four-company battalions. In practically all armies the infantry regiment is now of three battalions. In the French, German, Italian and Russian armies there are three companies to a battalion. In the British and Japanese armies there are four. An infantry of 10,500 is the strength in most countries. Germany has but 8,400 while Japan has 15,138.

**Artillery.**—The proportion of rifles and light and heavy machine guns per 1,000 infantry soldiers varies. Japan has the highest number of rifles, 837, and France the lowest, 277; Germany the highest number of light machine guns, 38.6, and Italy the lowest, 23; Russia the highest number of heavy machine guns, 15.8, and Japan the lowest, 6.5. Germany leads with by far the greatest number of close support weapons for the infantry; such as mortars, small calibre light guns, howitzers, anti-tank guns. Per infantry division the total is around 231. Most other countries average under 100. Russia has but 38. However, each Russian infantry regiment has 6-76mm. field guns assigned to it. This in addition to the divisional artillery.

The divisional artillery consists of one or more regiments of

artillery except in the British army where there is no regimental tactical organization—the three battalions being organized into a brigade which is the equivalent of a regiment in other armies. Where there is more than one regiment the artillery is organized into a brigade. The regiments are of two to four battalions of two or three batteries each. Batteries are of three, four or six guns, four being the more usual number. Except in the British and Italian armies where only guns are assigned to the divisional artillery, the divisional artillery consists of both guns and howitzers. One of the questions under discussion in various armies is whether it is better to have only guns with the infantry division, the howitzers being with the Army Corps artillery and sent to the divisions when needed, or to have the howitzers an integral part of the divisional artillery. The light guns are around 3in. in calibre and the heavy from 4in. to 4.5 inches. The light howitzers are around 4in. or 4½in. in calibre and the heavy around 6 inches. The number of artillery pieces per 1,000 men in the division varies from 1.87 in the Japanese army to 3.49 in the German army. In all countries while the fundamentals of an infantry division have generally been decided upon changes in detail are constantly taking place.

**Cavalry.**—There are three types of cavalry division today:—one, entirely mechanized; two, mechanized reconnaissance units with the mass of the division still horsed and, three, horse divisions. Russia with about 23 horse cavalry divisions has by far the greatest amount of horse cavalry. Germany is the leader in having an independent mechanized force directly under the high command with a "Panzer Corps" of at least two mechanized divisions. Russia is reported to have from two to six mechanized divisions, but how far these are actually "in being" is not known. Great Britain has one independent mobile division consisting of two mechanized brigades, one tank brigade, one infantry battalion and service troops. The Japanese Kwantung army is motorized and mechanized, but the details are secret. France has one light mechanized division (cavalry) and is organizing another. In Italy the mechanized forces are under army unit commanders.

In the United States and Japan, the army and navy each have their own air forces. In other countries the air forces are independent of the army and navy except that in Russia the land forces, air force and sea forces are all parts of the same organization.

**Maginot Line.**—In France the construction of the Maginot Line of fortifications along the German border is responsible for two new developments. First, the line itself is not a series of strong detached forts with long intervals of open ground between as were the old lines from Verdun to Toul and from Epinal to Belfort. Instead, it is a long trench system of the 1914–18 war with all the machine gun nests, battery positions, observatories in concrete and steel instead of earth and wood plus an elaborate system of concrete dug-outs and communicating tunnels with gas proof chambers, kitchens, living quarters, supply and ammunition chambers and dressing stations for the wounded. In the second place, the officers and many of the troops needed to garrison this line are part of a new special frontier corps permanently quartered alongside their defence sector. The reservists necessary for war strength are the male inhabitants of the nearby villages. This corps was brought into existence to prevent the danger of the line being broken through before the fortifications could be manned by a surprise attack of a mechanized and motorized force supported by aviation. (See also MARINE CORPS; MUNITIONS OF WAR; NATIONAL GUARD; WARFARE; WORLD ARMAMENTS.) (H. J. RE.)

## Armstrong, Henry Edward

(1848–1937), British chemist, who taught in London for 30 years, died in London, July 13, 1937. The *Encyclopædia Britannica*, vol. 2, p. 394, contains a brief biography.

## Art Exhibitions.

In the United States, Mr. Jules S. Bache announced his intention to present to the State of New York his house filled with art treasures, one of the finest collections in the U.S. This has since been opened to the public. In New York, also, the Van Gogh exhibition reopened at the Museum of Modern Art; pictures and prints dealing with sport were shown at the Metropolitan museum, followed by The Art of Renoir; and at Wildenstein's, "Thirty Years of Manet." At the Pennsylvania museum 10 new galleries devoted to French art were opened, and 50 paintings by Guardi were placed on view at the Springfield Museum of Fine Arts. The Metropolitan museum of New York celebrated the 200th anniversary of John Singleton Copley, R. A.

Throughout the summer an important exhibition of works by Frans Hals, 34 being loaned from America, was held at Haarlem, Holland.

The prospects of a coronation season encouraged a heavy crop of art exhibitions in London. Following the Jubilee exhibition of the British school at Athens, Burlington house in London opened its doors in January to a retrospective display of British architecture covering the past 336 years, an interesting feature of which was John Nash's original layout for the Regent's Park estate. At Knoedler's were shown a series of portraits of royal and noble personages by Winterhalter (d. 1873). During February, a loan exhibition of works by Sir Joshua Reynolds was held at Sir Philip Sassoon's house in Park lane. The principal events during April were the Centenary exhibitions of John Constable at the Tate gallery, at Wildenstein's and at the British museum; and the opening by the King of the National Maritime museum at Greenwich.

The coronation month (May) began with the annual Royal Academy exhibition, and the Royal Treasures exhibition, continued from the previous month. Pictures and relics illustrative of the Kings and Queens of England were on view at the Victoria and Albert museum, a coronation exhibition was held by the Royal Society of British Artists, and modern painters, mostly French, were being shown at the Leicester galleries. A further coronation exhibition was held at Agnew's. Gems of painting and of engraving were at Sabin's.

Works by Wilson Steer were seen at Barbizon house, followed by those of Henry Tonks, late Slade Professor at University college. On June 29 extensive new sculpture galleries, the gift of Lord Duveen to the Tate gallery, were opened by the King.

Late in September, the antique dealers' fair staged its fourth annual exhibition at Grosvenor house (London), remaining open for three weeks, and Sea Power pictures at the New gallery were introduced by Mr. Winston Churchill. Throughout November 240 works in oil- and water-colour by Peter de Wint were shown at Lincoln City.

Later in the year also, a new experiment in presentation was the documented and "extra-illustrated" exhibition in Paris of works by Van Gogh at the Musée d'art Moderne.

The seasonal salons in Paris took place as usual, but were somewhat eclipsed by the wonderful display of 1,000 masterpieces of French art from Gallo-Roman times to the 20th century at the Musée Moderne in the International exhibition. Examples of Catalanian and Austrian art of the 19th century were placed on view at the Musée du Jeu de Paume, and, in July, paintings by El Greco, nine of them lent by King Carol II of Rumania, were shown at the Galerie des Beaux-Arts. An extensive gathering of modern paintings, drawings, sculpture, and engravings by the *Maîtres de l'Art Indépendant* was to be seen at the Petit Palais. Paintings by Gauguin were shown at the Galerie des Beaux-Arts; works by Turner and Blake at the Bibliothèque National introduced

to the French public certain specialized and individual aspects of British art, and at the Musée des Art Décoratifs were over 400 drawings by Constantin Guys. An important show of Rubens and his Time at the Orangerie in Paris was a notable event earlier in the year. (See also ART GALLERIES AND ART MUSEUMS.)

(H. G. F.)

**Art Galleries and Art Museums.** The year 1937 started off with an epochal event. In his New Year's mail President Roosevelt found a letter from Andrew W. Mellon, former American ambassador at the Court of St. James, in which the United States Government was offered the Mellon collection, valued around \$20,000,000, a building for it to cost about \$10,000,000, and an adequate endowment for staff and growth. This *étrenne* which promises to amount to some \$50,000,000 was accompanied by a number of conditions, all of which proved acceptable, and subsequent legislation consummated the gift. The new museum is to be called the National Gallery of Art and as an autonomous unit of the Smithsonian Institution to be located on the Mall in Washington. While the works of art of the Mellon collection form already a substantial nucleus, the gallery will be of greater importance because of the opportunity for growth afforded by its endowment and by its claim on Government support. The most interesting of Mr. Mellon's conditions was that new acquisitions be kept to the standard of quality of the donor's collection. He also stipulated that John Russell Pope be the architect, and before Mr. Pope's death, Aug. 28 (following Mr. Mellon's Aug. 26), the architect's plans were sufficiently advanced for the condition to be met.

Meanwhile from the designs of Mr. Pope, associated with the London architects Messrs. Romaine-Walker and Jenkins, five new halls for sculpture, Lord Duveen's gift to the Tate gallery, were completed. Architecturally they restore unity to the design of the gallery and the three largest form a magnificent vista nearly 300ft. in length. The formal opening in June was the principal museum event of the year in London, but an important new foundation, though it does not involve a new building, is the University of London Institute of Archaeology housed at St. John's lodge in Regent's park. St. John's lodge is a neo-classic mansion of 1819, subsequently the town house of the Marquesses of Bute. At the outset the institute will concentrate on the archaeology of Palestine and of the British Isles: the extensive collections resulting from Sir Flinders Petrie's excavations in Palestine are installed here as well as considerable material of the early iron age and Roman period.

Another capital to receive a new art museum in 1937 was Paris, where among other buildings the International Exposition brought into existence a Musée d'Art Moderne. This was opened in June, a building in the international style, on the avenue Président Wilson facing the Musée Galliéra and running through to the Seine. The building has two separate parts joined by a colonnade and sculpture court. The western part is a national museum intended to replace the Luxemburg after the Exposition. The eastern part is a city museum, an adjunct of the Petit Palais, which it will supplement in the display of the collections of the city of Paris, chiefly formed by purchases from the annual salons since 1875. The International Exposition has also occasioned the complete transformation of the Palais du Trocadéro. The central block has been removed and the two wings redesigned in white stone. The west wing will house the famous Musée de Sculpture Comparée, the east the Musée d'Ethnographie and a new museum of French folklore.

While the development of museums in the world's capitals is conspicuous, it is perhaps less significant than the ubiquitous

museum activity in remote parts of the world. Some of this activity is as peripheral in character as it is in geography, and more new ideas may come from it because of its variety. The publication, delayed until 1937, of the sixth volume, *India*, completed the Museums Directory (of the British Empire) published by The Museums Association, London, and caused a great deal of comment. First, the world in general was oblivious of the 105 museums in India. Second, the problems of a museum are novel in a country where literacy is not regarded as a panacea. Third, the whole status of museums is in question where 90% of the population are not urban and where there are 3,000,000 inhabitants per museum—in contrast to the 48,000 per museum in Norway. As with regard to so many other matters India offers in connection with museums its usual challenge to Western civilization.

The report in the spring of 1937 of the Empire Grants Committee, which since 1934 had made 25 grants totalling about £11,000; the money was given for these grants by the Carnegie Corporation of New York, brought to public attention many almost unknown museums scattered through British possessions from the Fiji islands to the Falklands and from Bermuda to Zanzibar. Even in England it is notable that the most important new museum of 1937 is not in London but at Sheffield where the City museum was opened in April. Combined with it is an extension to the Mappin Art gallery. The former provides a dignified home for the Sheffield collections of cutlery, metalwork, pottery, silver, etc.; the latter contains some 300 objects from the art collection of Alderman Graves, who had already given to Sheffield the Graves Art gallery opened in 1934.

In the United States, while there has been growth at many of the great art museums, such as the wing added to the Cincinnati museum, the ten new galleries for French art opened at the Pennsylvania museum, and the new wing of the Baltimore museum, the year 1937 has been characterized also by the museum activity of remote districts. Two of the smallest of the State universities, Maine and Montana, have undertaken the building of art galleries (other new museums are at the University of North Carolina and the University of Colorado), and the lesser cities have been the ones to acquire museums during the year, such as Little Rock, Ark.; Syracuse, N.Y.; and Grand Rapids, Mich. (for furniture). The inevitable result of taxation in America is to cause the large private collections to become public property. In 1937 two such transfers occurred—the collections of the late John Ringling at Sarasota, Fla., and of Jules Bache in New York.

The Paris Exposition, like that of Chicago before it, is indicative of a coming trend in museum development. Open air museums have long been characteristic of Scandinavia, where the first one "Skansen," was opened by Dr. Arthur Hazelius over 50 years ago. The majority of these were designed to show the peasant life of bygone days but such a one as that at Aarhus, Jutland, founded in 1909 shows the life of an old town, and it is the open air museum of this type that has been the inspiration of the various "villages" of the Chicago and Paris fairs. Something of the same sort is the Williamsburg, Va. reconstruction, and the restoration of the Derby Wharf national historic site at Salem, Mass. Minor examples of the same sort of thing can now be expected anywhere. Two approaching the Scandinavian models and dating from 1937 are the Mandan village (an Indian village) in North Dakota and the similar reconstruction at Mound park, Tuscaloosa, Ala.

Historic spirit likewise underlies the transformation of a great number of houses into new museums. Most of these historic house museums definitely propose to preserve a record of a specific period, frequently of the period when some conspicuous personality was resident in the house. One of the most successful

examples in England is Belgrave hall, a house of the early 18th century, with appropriate furnishings, which was opened as a public museum of Leicester in May. Among historic houses in the United States recently converted into museums are those of the Presidents, Andrew Johnson, James Buchanan, and Benjamin Harrison; of the poets, James Whitcomb Riley, Paul Laurence Dunbar, and Edgar Allan Poe; of the admiral, John Paul Jones, the general, Stonewall Jackson, and the painter, Winslow Homer. In some cases the undertakings of this sort will serve both art and history, for example, making a State park of the Ephrata Cloisters in Lancaster county, Pa., where the church, Sisters' House, Brothers' House, and several small structures will form an open air museum of unique architectural character and historic significance. In other cases sentiment will chiefly be served, for example, by the Betsy Ross house and by the Squire Boone farm (birthplace of the explorer Daniel Boone). (J. Sy.)

**Arthritis.** The greatest recent advance in the conquest of arthritis has probably been made in its prevention. By recognizing the disease early, and instituting correct treatment before permanent joint changes have taken place, the disease can be cured or arrested in the vast majority of cases. Support is constantly being added to the belief that complaints such as neuritis, bursitis, lumbago, sciatica, or sacroiliac disease are in reality indications of beginning arthritis. Palliative treatment in these cases may give temporary relief, but years later many of these patients develop general joint disturbances. If a more comprehensive attack on the arthritis problem is instituted when the first symptoms appear, further involvement of the joints may be prevented.

A well rounded plan of treatment for arthritis must include measures to remove or relieve any existing infection. Vaccine is to be used to combat the effects of infection. Dietary regulation is frequently necessary, the most satisfactory diet consisting of simple foods, an abundance of fruit and green vegetables, and a moderate amount of protein and carbohydrate. Rich, high calorie foods should be restricted. Incorrect living habits and emotional difficulties should be adjusted. An abundance of rest is helpful and exercise should be gauged to the patient's capabilities. Physical measures such as baths, hydrotherapy and light massage are necessary to maintain muscular tone and mobility of the joints, and in cases where crippling is more advanced, underwater massage and exercise in the therapeutic pool is helpful.

Among the measures which have been receiving increased attention in recent years may be mentioned short wave diathermy, iontophoresis (forcing drugs through the skin by means of galvanic electric current), fever treatment, sulphur injections and massive dosage of vitamin D. In spite of an occasional enthusiastic report, it does not seem likely that any of these measures is destined to a permanent place in the treatment of arthritis.

The causes of arthritis are still the subject of considerable controversy. The disease results from a combination of disordered bodily functions some of which may be inherited. Focal infection or sensitivity to germs or their poisons is the important causative factor in most cases. Germs of the *streptococcus haemolyticus* group are most often the infecting agent although other germs may play a part. Environmental conditions and emotional disturbances are important factors in predisposing a person to arthritis and such elements as physical or mental fatigue, injury to the joints, digestive disturbances, respiratory infections, and the menopause are frequently involved in precipitating the onset of the disease. (M. F. L.)

**Art Sales.** For various reasons the most important Continental and many American sales in 1937 were staged in London. In April, 43 pictures, owned by Capt. C. N. F. Loyd, mainly Dutch, were sold at Christie's for £53,487. On April 19, the sale of the extensive Rothschild collections at 148 Piccadilly was undertaken by Messrs. Sotheby. Twenty pictures were sold for £23,000, including £17,500 for a work by De Hooch, the highest price of the year. The Continental and English plate realized over £40,000, and with the remaining objects the total achieved was £125,000. This marked the season's culmination. At a sale of armour at Sotheby's, the funeral helm of Henry VI was acquired for St. George's Chapel, Windsor.

In New York, at the American Art Association Anderson Galleries, a record was made by the sale of a silver monteith by John Coney of Boston (1655-1722) at \$30,000, and, also in April, the Hubert Lawton collections, American furniture, pictures, etc., realized \$93,000.

At Christie's in May, 120 pictures from the Leonard Gow collection reached a total of £43,000, while at the same rooms 140 lots of silver fetched over £17,000, including a parcel-gilt tankard, sent by Lord Rochdale (£11,950). In New York, the colossal assemblage of works of art forming the Brady collections were sold for \$471,000 (American Art Association Anderson Galleries).

At a sale of pictures totalling £47,000 on July 2 at Christie's, £12,500 were given for 23 drawings by Turner, from Farnley Hall. At Christie's also, in a silver sale which yielded £13,030, the mace of the Irish House of Commons (1765-1801) was purchased by the Bank of Ireland for £3,100. At Christie's, again in July, eight paintings of Canaletto from the Earl of Lovelace realized £11,030.

Paintings, the property of the late T. S. Pearson Gregory, included five overdoor panels by Boucher, which reached the unexpected sum of £23,000, and £14,000 resulted from the sale of Sir Leicester Harmsworth's pictures. July also saw the dispersal at Sotheby's of the W. F. van Heukelom (Amsterdam) collection of Chinese porcelain, which attained nearly £15,000. On the 22nd, the famous Greffuhle collections from Paris (pictures and works of art) achieved £62,300, which included a drawing by Watteau, £5,800. In October, Messrs. Christie sold the remaining contents of the Clumber mansion and gardens on the premises for about £11,500.

The re-opening of the season in November saw the dispersal of the Guilhou collection of rings, sent from Paris, a four days' sale at Sotheby's resulting in £15,000. The Martin Erdmann mezzotints, sent to Christie's from New York, brought £17,234, with other articles totalling £31,364. English silver, the property of an American collector, yielded £21,664 at Sotheby's on Nov. 15. (See also BOOK SALES.) (H. G. F.)

**Asbestos.** A world output of 400,000 metric tons in 1929 declined to 205,000 tons in 1932, reached a new high record of nearly 500,000 tons in 1936, and will probably show a still further increase in 1937. Asbestos is a mineral that is largely of British origin, since 90% of the 1929 output and 70% of that of 1936 was mined in the British Empire. In 1936 Canada supplied 54% of the world total, Southern Rhodesia 10%, South Africa 4% and Cyprus 2%; the only large producer outside the Empire was the Soviet Union, with 26% of the 1936 total, increased from 7% in 1929. The only other large producer to increase output was Rhodesia, where production has expanded by one-third since 1929. The United States consumes over one-half of the world supply but has only a minor output, which, however, has increased by more than threefold during the past few years, reaching 10,000 tons in 1936. (G. A. Ro.)

**Ascension:** *see* ST. HELENA AND ASCENSION ISLAND.

**Ashton, Algernon Bennet Langton** (1859-1937), British musical composer; born at Durham, Dec. 9. He lived at Leipzig from the age of three to that of 20, and studied music there under, among others, Franz Heinig, Karl Reinecke, and E. F. Richter, and later at Frankfort under Joachim Raff. After having returned to England, he was professor of the pianoforte at the Royal College of Music from 1885 to 1910, and from 1913 to 1935 was on the staff of the London College of Music. He published a very considerable amount of music, much of which is of a high quality; but was more in the public eye as a prolific writer of letters to the Press. In 1909 he married Ethel Clara Hall, and he had one son. He died in London, April 10, 1937.

**Asia Minor,** a geographical term, no longer in local or official use, formerly employed to designate the peninsula on the extreme west of the continent of Asia, bounded on the north by the Black sea, on the west by the Aegean, on the south by the Mediterranean, and on the east by the Armenian plateau, being separated from Europe on the north-west by the Bosphorus and Dardanelles.

**Asphalt.** More than half of the world supply of native asphalt comes from the famous asphalt lake of Trinidad; the bulk of the remainder is divided between Egypt and the United States, with possibly 10% distributed among several minor producers. A number of countries, with the United States in the lead, produce considerable quantities of asphaltic or bituminous rock, carrying usually less than 10% of true asphalt. The largest item, however, is petroleum asphalt, of which there was produced in the United States in 1936 some 5,500,000 short tons, two-thirds from domestic petroleum, and one-third from foreign. As compared with this, the domestic production of bituminous rock was 547,000 tons, and native asphalts only 33,700 tons. (G. A. Ro.)

**Assassinations.** A list of assassinations, actual or attempted, during 1937 includes:

- Feb. 4 General Wang I-chey, Shensi province, China, assassinated by mutineers.
- Mar. 17 Miss Magda de Fontanges shot and wounded Count Charles de Chambrun, former French Ambassador in Italy, over alleged disruption of romance with Mussolini.
- July 14 Lisbon, Portugal. Attempted assassination of Prime Minister Antonio de Oliveria Salazar by bomb. Statesman unhurt.
- July 18 Warsaw, Poland. Attempt to bomb Col. Adam Koc, politician. Assassin killed.
- Aug. 12 Bagdad. General Baqir Sidqi, dictator of Iraq, assassinated by soldier. Major Mohammed Ali Jawdat, Commander of Iraq's air force also killed.
- Sept. 26 Nazareth. Lewis Yelland Andrews, District Commissioner of Galilee and his bodyguard Constable Peter R. McEwan shot and killed.
- Oct. 12 Beirut, Syria. United States Consul James Theodore Marriner killed by crazed Armenian.

**Astronomy.** In astronomy, probably more than in other sciences, a large proportion of the year's work is of a routine character. Examples of such work are: cataloguing stars according to position in the sky and recording their apparent magnitudes, spectral types, proper motions, and determining their parallaxes; systematic observations of variable stars; observation of motions of the Solar System; recording solar activity; making surveys of extra-galactic nebulae. Further, extensive mathematical and physical investigations are carried out as necessary preliminaries to forming theories of astronomical phenomena. So the results about to be described, selected for their representative or novel character, are *immediate* fruits of only a fraction of the year's activities.

Before giving these results, we may instance just one of the modes of investigation of recent growth, which is leading to new astronomical discoveries. Since our knowledge of celestial objects is derived almost exclusively from the radiation they transmit to us, advances in this knowledge depend on increasingly refined study of this radiation. A recent refinement is the study of *line profiles*, a highly technical investigation of the minute detail in the structure of absorption and emission lines in astronomical spectra. It is now understood how nearly all the physical circumstances of a star's atmosphere influence the profiles of the lines in its spectrum; thence very accurate knowledge of the surface layers of stars is being obtained. Similar methods are applied to the study of gaseous nebulae and interstellar matter, and even planetary atmospheres.

**Solar System.—The Sun.**—This has been a year of great solar activity, as was to be expected, since a sunspot maximum in the 11-year solar cycle occurs early in 1938. Some sunspot groups in recent months were amongst the largest ever recorded. An important discovery has been made concerning bright solar eruptions. These consist in a sudden ejection and subsequent dispersal of intensely luminous gas, probably mainly hydrogen, from small areas of the sun's surface, usually near sunspots, the whole phenomenon lasting on the average about 20 minutes. It is found that sudden radio fadeings on the sunlit side of the earth frequently occur at the same time as these eruptions, and are of similar duration. It appears therefore that these small parts of the sun's atmosphere emit some kind of radiation, travelling with the velocity of light, which profoundly affects the state of the earth's ionosphere. Incidentally, it has also been discovered that the ionosphere may be influenced by the entry of a meteoric shower.

Motion pictures have now found a place in astronomy, having been successfully made at the 1936 and 1937 solar eclipses, and also during the year many astronomers have seen the films made at the McMath-Hulbert Observatory of various types of solar prominences "in action." Colour-photographs have also been made at recent eclipses.

The solar eclipse of June 8, 1937, gave the longest period of totality, over seven minutes at noon-point, of any eclipse since A.D. 699. Unfortunately its track lay almost entirely over the Pacific ocean. However, it was successfully observed from Canton island, in the Phoenix group, by New Zealand and U.S. expeditions, and from Peru, shortly before sunset, by Japanese, S. American, and U.S. astronomers. The corona was of the form characteristic of spot-maximum, and estimates of its total light vary from 0.5 to 1.5 times that of full-moon. Dr. Dunham announced the discovery of new lines of unknown origin in the blue region of its spectrum. Much curiosity was aroused by reports that photographs taken by Major Stevens from an aeroplane in Peru, at a height of 25,000ft. showed a "globular" corona much more extensive than that photographed through the earth's lower atmosphere. This is taken to confirm the view already held by astronomers, that the coronal "streamers," usually featuring prominently in

COMET FINSLER, discovered by Dr. P. Finsler of Switzerland, July 4, 1937, which came within 45,000,000 miles of the earth August 9

photographs, do not constitute the whole corona, which consists in addition of a more uniform envelope extending round the sun to a height greater than that to which the streamers are visible.

Dr. B. Lyot made a great advance in 1931 by photographing the corona, from the Pic du Midi, without an eclipse. This year he published new results of such observations, including the profiles (*see above*) of the emission lines in the coronal spectrum, the only important lines in astronomical spectra whose origin is still unknown.

**Planets.**—Recent redeterminations of the moon's motion have enabled Dr. Harold Jeffreys and Dr. Spencer Jones to recalculate the figures of the earth and moon. They find for the reciprocal of the earth's ellipticity (the ratio of the difference between the equatorial and polar diameters to the equatorial diameter) values  $297.19 \pm 0.52$  and  $296.08 \pm 0.95$  respectively. Jeffreys finds the moon to be of nearly homogeneous density, and that the high values he obtains for its ellipticity cannot be explained if it be supposed to have solidified when keeping the same face to the earth, but could be explained if it was rotating in about three and a half days when solidification occurred.

**Comets.**—This year has seen the 39th reappearance of Encke's comet since its discovery in 1786. Comet 1937f (Finsler) reached a brightness of fourth magnitude in August, so it could be seen with the naked eye. It developed a tail, extending over more than  $20^\circ$  of the sky, which showed rapid variations in structure.

Dr. Robertson has recalculated the retardation experienced by a particle moving round the sun, due to the radiation field, this being analogous to the drag on a body moving through falling rain. The effect is not great enough to account for certain unexplained peculiarities in cometary motion, but is important in precluding the continued existence of certain resisting media sometimes supposed present in the solar system.

**Stars.**—*Special Stars.* A star of peculiar interest is  $\zeta$  Aurigae.

It is an eclipsing binary star, of which the components are a red super-giant K-type star, whose radius is about 300 solar radii, and a normal B-type star, whose radius is between two and three solar radii. At the beginning and end of the eclipse the light of the B-star reaches us through the atmosphere of its companion, the depth of this atmosphere being of the order of one-quarter the K-star's radius. The analysis of the observations makes possible for the first time a measurement of the structural details of the outer atmosphere of a star other than the sun. The period is 972 days; an eclipse occurred this year, commencing April 21, numerous observations being made. An interesting preliminary result is that the whole eclipse lasted about 13 hours longer than the preceding one (1934), probably indicating that the depth of the K-star's atmosphere was about one per cent greater in 1937 than in 1934.

No notable ordinary novae have been discovered this year, but observations continue to be made on those of recent years. Nova Herculis 1934 evidently split into two components during its outburst, and this year's observations show that the distance between the components is increasing at an approximately constant rate.

A significant result now being established is that there are apparently *two* classes of novae, ordinary novae and *super-novae*. The former at maximum generally reach an absolute brightness from 10,000 to 100,000 times that of the sun, while the latter appear to reach a brightness from 10 to 100 million times that of the sun, or even more. They are the only individual stars which can be seen up to about the greatest distance to which extra-galactic nebulae can be observed. It is estimated that, in any one galaxy, about 30 ordinary novae appear annually, while a super-nova occurs on an average only once in several centuries. "Tycho's star" of 1572, which could be seen in daylight, was probably one in our own galaxy. Dr. Zwicky has instituted a systematic search for these objects, and already, in August and September (1937), has

TOTAL SOLAR ECLIPSE, June 8, 1937. Photo by J. E. Willis of the National Geographical Society—U.S. Navy Expedition to Canton Island

found two. The former is in the nebula in Canes Venatici, and its spectrum was secured.

The estimated absolute brightness (— 16 magnitudes) of the latter, when first observed, made it the most luminous known celestial object, considerably exceeding the total brightness of the nebula (N.G.C. 1003) in which it occurs.

**Stellar Structure.**—Astronomers are still attacking the problem of the source of energy-generation in stellar interiors, having regard to the latest laboratory data on atomic transmutations. The theory, current a few years ago, that stellar energy is produced by the annihilation of atoms, has now given place to the idea that it is produced by the building up of heavy atomic nuclei out of lighter ones. This process results, as is well known, in a net loss of mass whose energy-equivalent must ultimately reappear as radiation. It is supposed that a star commences its life as a mass of pure hydrogen; collisions between its atoms produce firstly neutrons and then the nuclei of light elements, notably helium; these in turn act as catalysts in building up heavier atomic nuclei. It is calculated that these processes would liberate sufficient energy to maintain the sun's radiation at its present rate for  $3 \times 10^{11}$ : i.e. 10 to the power of eleven, years, which on the whole fits in with other estimates of the age of the stars.

**The Galactic System.**—Fresh data appear to demand no fundamental revision of the general ideas of the structure and motion of the galactic stellar system sketched some years ago by Shapley and Cort, respectively. Professor B. J. Bok, summarizing our present knowledge, endorses Seare's suggestion that, seen from outer space, the Milky Way very possibly would look like the spiral nebula in Triangulum; our sun would be in one of the

spiral knots about two-thirds of the way from the centre of the nebula to its edge. It would be seen to possess a central layer of obscuring material, about 500 parsecs thick.

Current studies of galactic nebulae, zodiacal light, the "fixed" calcium and sodium lines, and the absorption of light in space, are revealing the nature of this material, showing it to consist partly of atoms and partly of dust particles. This year evidence of the presence of *molecules* has also emerged.

**Extra-galactic Nebulae.**—As examples of the magnitude of current investigations of extra-galactic nebulae, or "island universes," one may cite the publication of surveys by Hubble (end of 1936) of over 8,000 of these objects down to apparent photographic magnitude 21 (i.e. to a distance of over 300 million light years), using the Mt. Wilson 100-in. reflector, and by Shapley of 36,000 southern galaxies, and of a theoretical study by Holmberg of 827 double and multiple galaxies. Also individual galaxies receive particular attention; e.g. Redman and Shirley's photometric study of the Andromeda nebula leads them to conclude that extra-galactic nebulae are more extensive than had been thought, and tends to dispel the idea that our own galaxy, while similar in structure to other spiral nebulae, may be above the average in size.

All such work is directed to discovering the large-scale structure of the universe. Surveys like those mentioned indicate that, to a first approximation, the galaxies show a statistically uniform distribution throughout the space accessible to existing telescopes. A second approximation indicates a small departure from this, if the classical properties of space be assumed, while it is well known that the spectral lines of these nebulae show a red-ward displacement.

These features are usually explained either by means of one of the general relativity models of the "expanding universe," which pictures the nebulae as embedded in expanding curved space, or by means of Milne's kinematical relativity, which pictures them as a dispersing cloud of "equivalent particles." Hubble, however, inclines to the view that the simple interpretation of the red-shifts as due to recessional velocities leads to untenable conclusions about the size of the universe and the density of matter in it. Most astronomers probably prefer to suspend judgment until yet more extensive data are available. (See also PHOTOGRAPHY: *Special Application*.)

**Atom:** see MATTER, STRUCTURE OF.

**Atom-Smasher:** see CHEMISTRY: *Atom-Smasher*.

**Auckland.** Largest city in the Dominion of New Zealand (*q.v.*); situated on the sheltered Hauraki gulf, on the east coast of the North Island; regular port of call for mail and other ships plying between Australia and North America. Pop. (1936), including Maoris: Auckland city, 102,295; total urban area, 212,159. Tonnage entered (1935): 2,307,664 tons engaged in overseas trade. Imports handled (1935): £NZ 12,136,235. Exports: £NZ 16,084,922 (including 107,529 tons of butter). At the end of 1936 and beginning of 1937, Auckland was the centre of an important strike of workers in freezing-works and cool-stores. The men demanded higher pay as the alternative to a 40-hour week. Go-slow tactics were followed by the first stay-in strike in New Zealand. The strike was settled through the intervention of the minister of labour, who persuaded the employers to increase time-wages pending arbitral review of the main issue. The outstanding event in the city's history in 1937, however, was the successful conclusion of experimental flights by Imperial Airways' and Pan-American Airways' flying-boats, with a view to making Auckland the terminus of regular freight and passenger air routes from San Francisco *via* Hawaii and from London *via* India and Australia.

**Australia, Central:** see CENTRAL AUSTRALIA.

**Australia, Commonwealth of,** a self-governing member of the British Commonwealth of Nations, situated in the southern hemisphere between longitudes 113°9' E. and 153°39' E. and latitudes 10°41' S. and 43°39' S.; capital, Canberra (Federal territory); ruler, King George VI, represented by a governor-general, Lord Gowrie, and by State governors; national flag, a blue ensign, with the Union Flag in the quarter and six white stars in the field.

**Area and Population.**—Area: 2,974,581 sq.mi.; population (March 1937): males 3,452,503, females 3,367,208, total 6,819,711; urban population (June 1933 census): 69.24%. The number of full-blood aborigines is estimated at about 55,000. The Church of England numbered (1933 census) 2,565,118 adherents; Roman Catholics, 1,161,455; Presbyterians, 713,229; Methodists, 684,022; other Christians, 603,914; non-Christians and no definite religion, 902,092. The overwhelming majority of the population speaks English, and there are only 29,738 English illiterates. Population 1935: Sydney, 1,254,780; Melbourne, 1,008,300; Adelaide, 315,130; Brisbane, 306,154; Perth, 210,365; Newcastle, 104,485; Hobart, 60,900.

**History.**—Federal Cabinet reconstruction was necessitated by

the electoral defeat, in Oct. 1937, of three ministers—Sir Archdale Parkhill (defence), Sir George Pearce (external affairs), Mr. T. C. Brennan (minister without portfolio)—by the simultaneous retirement of Mr. T. Paterson (interior) and Mr. J. A. J. Hunter (without portfolio), and by the resignation, in March 1937, of Sir Henry Gullett (without portfolio, in charge of trade treaties). The new ministry, announced on Nov. 29, was as follows: prime minister, J. A. Lyons; commerce and health, Dr. (later, Sir) E. C. G. Page (formerly commerce); attorney-general and industry, R. G. Menzies; external affairs and territories, and vice-president of the executive council, W. M. Hughes (formerly health); postmaster-general and leader of the Senate, Senator A. J. McLachlan (formerly postmaster-general and development); trade and customs, Lieut.-Col. T. W. White; treasurer and development, R. G. Casey (formerly a treasurer); defence, H. V. C. Thorby (formerly without portfolio); repatriation, Senator H. S. Foll (new minister); interior, J. McEwen (new minister); assistant ministers, J. A. Perkins, V. C. Thompson, A. G. Cameron, and Senator A. N. MacDonald.

The Australian commonwealth is a federation of six States sovereign in their own field. Amendments of the constitution must be passed by the Federal Parliament, and approved at a referendum by a majority of the votes cast and by a majority of voters in a majority of States. Amendments to extend the powers of the commonwealth in regard to marketing and to give it full powers to legislate for air navigation and aircraft were passed by Parliament and submitted together in a referendum on March 6, 1937. Both were defeated. On the marketing amendment, 1,259,808 electors voted yes and 2,214,388 voted no. The aviation amendment secured a total majority of 1,924,946 to 1,669,062, but not the required majority in four States. Uniformity of laws on civil flying was subsequently secured through the passage of similar legislation in all States.

A Federal general election was held on Oct. 23, the triennial term of the House of Representatives having expired, and the Senate seats due to fall vacant in July 1938 being filled simultaneously. The united Australia and country parties stood as a Government coalition, against the Labour party, Social Credit, and minor groups. Mr. Curtin (Labour), in his policy speech, said Australia should not be committed to warlike activities outside the commonwealth without the people's consent. She should concentrate on local, particularly air defence. Her self-reliance would be a notable contribution to the defence of the British commonwealth. He promised to "make the Commonwealth bank the nation's bank." Labour would enforce the 40-hour week and would provide £6 millions from Federal revenues for inaugurating a system of unemployment allowances. Mr. Lyons (U.A.P.) told the electors that, if the birth-rate declined further, without immigration the population would begin to fall in 20 years or sooner. On defence, Australians desired confirmation of the benefits of the imperial connection rather than isolation. The Ottawa agreement, the Government felt, required revision, and they also sought a satisfactory trade pact with the United States. They would strengthen the Commonwealth bank as recommended by the Royal Commission (*see below*). They would submit to Parliament plans for sickness and widows' and orphans' pensions affecting three million people. The States were better able to handle unemployment insurance, but the commonwealth would help. The Government, while not opposed to the 40-hour week, asked for preliminary inquiry.

The campaign was mainly concentrated on issues of external policy and defence. The result was a victory for the Government in the Lower House and a setback in the Senate.

The principal measures introduced in the Federal parliamentary session of June 17 to Sept. 15 were obliged to stand over, not

having been passed by the date of the dissolution. They included a bill to adopt the sections of the Statute of Westminster which had been left for Australia to adopt at her option, and a bill reconstituting an inter-State Commission for commerce and finance. The session was largely occupied with debates on the Imperial Conference and on the budget.

After the general election, discontent was manifested in the Labour party with the leadership of Mr. John Lang in New South Wales. Two of his chief supporters, Mr. Beasley and Mr. Rosevear, were displaced in the Federal Labour Executive by members of the opposite faction.

Great concern was aroused in Australia by the Chinese-Japanese war (*q.v.*). The Australian Government had shown its close interest in Far-Eastern affairs by proposing, at the Imperial Conference (*q.v.*) in May, a regional understanding and pact of non-aggression among the countries of the Pacific, "conceived in the spirit of the principles of the League." Considerable anti-Japanese feeling was apparent later in the year. Trade unions in South Australia and New South Wales voted for a boycott of Japanese goods, and there were other sporadic anti-Japanese demonstrations.

At Geneva, Australian representatives played a leading part in promoting an approach to world economic betterment through a study of standards of nutrition.

**Trade and Communications.**—The principal agricultural and pastoral products, with value<sup>1</sup> of output in 1935–36,<sup>2</sup> were wool, £55,186,000; beef, £14,556,000; mutton and lamb, £13,369,000; dairy products, £32,448,000; fruit, £7,702,000; eggs and poultry, £9,578,000; wheat, £29,768,000; sugar-cane, £7,493,000. Total area under crop, 1935–36, 19,974,042 acres. The output of the principal non-agricultural products was valued as follows in 1936: gold, £10,183,000; silver, £368,000; lead, £764,000; silver lead ore, concentrates, etc., £3,815,000; zinc and concentrates, £935,000; tin and tin ore, £659,000; coal, £6,663,000; ironstone, £2,172,000; forest products (net value, 1935–36), £6,808,000.

**Employment.**—The value of Australia's principal exports in 1936–37 was: wool, £62,529,000; wheat and wheaten flour, £24,362,000; meat, £10,323,000; fruits (fresh, dried, and preserved), £5,053,000; butter and cheese, £8,100,000; gold, £13,724,000; lead, £5,073,000. Total exports, including gold and silver, amounted to £126,200,000 sterling, against total imports of £90,500,000 sterling. After allowing for £22 millions sterling of interest on public debt, and for other invisibles, approximately £20 millions was added to Australia's sterling assets. The export price index reached a peak of 1,019 in April 1937 (1928=1,000). By September it had fallen to 919, but was still nearly 15% above the level of Sept. 1936.

The net value of production in the principal factory industries in 1935–36 was: iron and steel, £7,133,000; general engineering, £6,128,000; railway rolling-stock and tramcar building, £6,774,000; wool manufacture, including hosiery, £8,048,000; total clothing, including boots and shoes, £14,015,000; breweries, £4,363,000; printing, £4,732,000; total, all industries, £162,437,000.

The percentage of trade unionists unemployed fell to 9.3 in the third quarter of 1937, comparative third-quarter percentages being: 1936, 12; 1932, 29.6; 1929, 12.1. Factory unemployment, estimated at 535,000 in June 1937, was then 19% above the 1928–29 average. The estimated value of material production (gross for primary and net for manufacturing industry) rose from £405 millions in 1935–36 to £432 millions in 1936–37.

**Railroads.**—Mileage open, 1935–36: Federal, 2,145mi.; State, 24,944 miles. The Federal budget for 1937–38 included the following estimates (actual results for 1936–37 in brackets): rail-

way receipts, £480,000 (against £436,293); ordinary railway expenditure, £1,206,000 (against £1,076,077); new railway works from revenue £269,000 (against £194,000).

The total of steam and motor tonnage on Australian registers at Dec. 31, 1936, was 250,512 tons; other tonnage, 86,051 tons. The volume of shipping entered into Australian ports in 1936 comprised 4,343,118 tons under British flags and 1,894,558 tons of foreign shipping. Inter-State and coastal shipping, other than through voyages, is reserved for Australian ships.

During the 1937 Imperial Conference, the United Kingdom, Canadian, Australian, and New Zealand Governments discussed the problem of competition from subsidized American ships on the North America to Australasia routes. No final agreement was reached, but there was general assent to aiding the Canadian-Australasian line to replace its existing vessels by two new ships. The Australian budget included £10,000 to cover commitments under this head in 1937–38.

The combined net loan expenditure of all States on roads and bridges in 1935 was £1,415,000. A contribution of £3,039,530 was made to the States for roads from the Federal budget for 1936–37.

The route mileage of regular internal air services (Aug. 1937) was 17,000mi., plus 4,361mi. of the Brisbane-Darwin-Singapore link of the England-Australia twice-weekly service. The flying mileage on internal routes totalled 5 millions per annum.

On Jan. 25, 1937, it was announced that agreement in principle had been reached with the British Government on the projected London-Sydney flying-boat service, timed to begin in Jan. 1938. Australia would retain administrative and defensive control over the section to Singapore. All first-class mail from Great Britain would be carried for 1½d. (sterling) a half-ounce, but Australia would retain a surcharge of 5d. a half-ounce. The agreement was for 15 years subject to satisfaction. Introduction of the scheme was retarded by delay in constructing flying-boat bases, but on Dec. 21, the minister of defence promised that temporary bases would be ready in April 1938.

Telephone facilities were extended in 1937, especially in the country districts. Six new national broadcasting services were installed in 1936–37, bringing the total to 21. There were also 80 commercial broadcasting services.

**Finance and Banking.**—(a) *Currency and Exchange.*—The Australian pound (£A) with sub-units as in English money had throughout 1937 a value 20% below that of sterling, *i.e.* approximately 16s. In Sept. 1937 £100 (nominal) of gold cost £A207.

(b) *Budget and Taxation.*—Mr. R. G. Casey, Commonwealth treasurer, presented his 1937–38 budget on Aug. 27. The realized surplus for 1936–37 was £1,276,558, revenue being £82,807,977 and ordinary expenditure £81,531,419. Income tax produced an excess of £1,076,000, thanks mainly to accelerated payment of arrears. Of the surplus, £1 million was appropriated for post-office public works, the remainder being set against past deficits.

In view of the formidable and inescapable increases in its obligations, said the treasurer, the Government was unable further to reduce taxation. Estimated revenue for 1937–38 was £85,190,000, the main increases being in customs and excise and postoffice receipts. Invalid and old-age pensions would be raised from 19s. to £1 a week, and would cost nearly £2 millions more. The total defence provision in 1937–38, including commitments, was £11,531,000, against £8,067,000 in 1936–37. Only £6 millions (against £5,851,000), however, would be borne on the budget, £3,031,000 being drawn from two trust accounts and £2,500,000 from a loan to be raised in London. Appropriations for public works, including defence and postoffice works, totalled £12,023,330 (against £9,184,584), of which £7,721,500 (against £6,858,092) would be

<sup>1</sup> In this article, unless otherwise stated, values are expressed in Australian currency. For rates of exchange, see section herein on *Finance and Banking*.  
<sup>2</sup> The Australian fiscal and statistical year ends June 30.

provided out of revenue. Payments to the States would show an increase from £15,021,990 to £15,565,500, thanks to more liberal federal aid for roads. The railways would cost £130,000 more. Total budget expenditure would rise by £3,628,000 to £85,160,000, allowing a nominal surplus of £30,000.

The States' budgets were in deficit in the aggregate, the combined surplus for Commonwealth and States being only £965,000. The combined public debt rose by £7,090,000 to £1,262,872,000 (nominal values in sterling and Australian currency), while the public debt of the Commonwealth alone fell by £4,130,000 to £356,910,000. In June, a loan of £12,360,000 sterling was converted in London at a saving of £446,000 in interest, and one of £11,410,000 sterling was converted to a longer-term basis in November.

Banking Statistics (Third Quarter of Each Year)

	Advances and Securities	Deposits	Cash Reserves
	£	£	£
1936 . . . .	303,300,000	282,400,000	29,500,000
1937 . . . .	306,200,000	306,600,000	36,500,000

**Education** is controlled by the States, the school entry age being six or seven years, and the statutory leaving age 14. The average attendance in 1934 was: State schools, 792,892; private schools, 196,927.

**Defence Forces.**—(a) *Navy.*—The Royal Australian navy consists of two 10,000-ton cruisers and one 7,250-ton cruiser (and smaller vessels) in commission, and one 5,100-ton cruiser and one 5,000-ton seaplane-carrier (and smaller vessels) in reserve. Naval vote, 1937–38: £3,600,000, an increase of £600,000, mainly for modernizing two cruisers, improving port defences, and developing Darwin as a naval sub-base.

(b) *Army.*—Army personnel, Dec. 31, 1935: permanent forces, 1,810; militia forces, 26,270; reserve of officers, 5,625; others, 483. There is no compulsory military service. Military vote, 1937–38: £3,300,000, an increase of £1 million, mainly for coastal and anti-aircraft defences.

(c) *Air Force.*—Strength (Sept. 1937): 8 squadrons, with 96 planes. Air vote, 1937–38, including civil aviation: £3,600,000, an increase of £2,300,000, mainly for additional squadrons.

(d) *Police and Irregular Forces.*—There are no such forces organized on a military basis.

(e) *General.*—Munitions supply vote, 1937–38: £1,100,000, an increase of £500,000. Efforts are being made to increase Australia's self-reliance in munitions supply, e.g., establishment of factories to manufacture aircraft and Bren machine-guns, encouragement of production of oil from shale.

**Australia, South:** see SOUTH AUSTRALIA.

**Australian Literature.** The output of 1937 was marked by a high level of competence rather than by any enduring achievements. Henry Handel Richardson's great trilogy, *The Fortunes of Richard Mahoney* (completed in 1929), retains its primacy in Australian fiction.

M. Barnard Eldershaw (Miss Barnard and Miss Eldershaw), brought into the front rank by *A House Was Built* (1931) and *The Glasshouse* (1936), scored another success with *Plaque with Laurel*, a novel describing a conference of literary people at Canberra. Outstanding was Helen Simpson's *Under Capricorn*, which took her back to the early settler days of 1831. *A Murder in Sydney*, by Leonard Mann, described the mind of an active and

passionate girl who had seen her father's satisfaction at her invalid mother's death, and had killed his mistress. Seaforth Mackenzie's *The Young Desire* was a novel of school and early emotional relationships. Others are Philip Lindsay, with *The Bells of Rye* and *Gentleman Harry Retires*; Mary Mitchell, with *Decline and Fall of a British Matron*. Martin Boyd's *The Picnic* dealt with the reactions of an English village to an Australian family.

Even novels most characteristically Australian usually found their publishers and in large measure their public in Great Britain. Mention must be made of the more purely domestic products that achieved widest success in Australia itself, namely, Ion L. Idriess's *Cattle King*, the latest of a popular series by this author, including *Lasseter's Last Ride* and *Man Tracks*. *Wonders of the Great Barrier Reef*, written in good strong English by T. C. Roughley won a deserved success. Outstanding biographies were his daughter's life of the late Prof. Sir Edgeworth David, and George Mackness's life of Admiral Phillip. (W. A. M.)

**Austria,** a State of central Europe and member of the League of Nations. Bounded W. by Switzerland, N. by Germany and Czechoslovakia, E. by Hungary, S. by Yugoslavia and Italy. Capital, Vienna. President, Dr. W. Miklas. National flag, red, white, and red, in horizontal stripes.

**Area, Population, and Cities.**—Austria consists of eight provinces (Lower Austria, Upper Austria, Salzburg, Styria, Carinthia, Tyrol, Vorarlberg, Burgenland) and a mediatized city, Vienna. Total area, 32,369 sq.mi.; population (1934), 6,760,233, of whom 90.57% were Roman Catholics, 4.38% Protestants, and 2.83% Jews. Except for a few Slovenes, Croats, and Magyars, the entire population is German-speaking. Elementary education is compulsory, and is provided by the communes and provinces. Higher education is State, provincial, or private. There are three State universities. The leading cities are Vienna (*q.v.*), with a population in 1934 of 1,874,130; Graz (152,841), Linz (108,970), Innsbruck (61,009), Salzburg (40,232).

The Constitution, introduced on May 1, 1934, is corporative, on a Christian foundation. Besides the president, there is a Federal Diet (*Bundestag*), State Council (*Staatsrat*), and cultural, economic, and provincial Councils. The Federal assembly meets when required to perform certain exceptional functions.

**History.**—The active struggle between Italy and Germany over Austria's body came to an end, for the time, with the Austro-German agreement of July 12, 1936. The Government in 1937 continued its precarious balance amid many opposing forces. Internally, no event of importance occurred. An appeal by the Chancellor, Dr. Schuschnigg, to the workers did not notably alter their attitude, half-way between resentment and resignation. There was much monarchist agitation: the chancellor was sympathetic. Foreign policy remained that of maintaining Austria's

AUSTRIA: Industrial production index (*The Annalist*)

sovereignty and independence as a basis of "friendship with Italy, the truce with Germany, good relations with other States," particularly warm with Hungary. The chancellor visited Italy in the spring, but showed himself slightly more independent than his predecessor towards that country. With Germany, while the German character of the State and people was often emphasized, while also attempts were made to meet the wishes of the more advanced nationalists in Austria, and frequent negotiations conducted with statesmen in Germany, no real normalization of relations could be reached. There were endless incidents, demonstrations by and arrests of Nazi sympathizers, and complaints of breaches of the promised newspaper truce. Commercial exchanges with Germany improved much less than the agreement of 1936 had anticipated.

**Trade and Communications.**—Agriculture in Austria continues to expand, the recent decrease in values being due to the fall in world prices. After hay and clover, the largest crops are (in that order) rye, oats, wheat, potatoes, barley. The cultivation of sugar-beets has greatly increased, as has the production of milk and dairy-farming generally. Milk, cream, and butter are now exported in considerable quantities. Timber remains a most important article of export.

The production of lignite in 1936 was 2,897,000 tons; of anthracite, 244,000 tons; of iron-ore, 1,020,000 tons; of pig-iron, 248,000 tons; of steel, 424,000 tons. The production of electricity was 2,600 million kw., mainly hydro-electric. Industry suffered from very severe unemployment. The figure of applicants for work on Jan. 31, 1937, was 407,475; on April 30, 330,095. The number of employed in March 1937 was 922,000, against 1,449,000 in 1929; the index of industrial activity for 1936, 90 (av. 1925-29, 100).

Both imports and exports have risen substantially from the lowest level. The figures, in millions of gold dollars, are:

	1929	1934	1935	1936
Imports . . . . .	459.0	126.9	134.3	139.1
Exports . . . . .	307.9	94.4	99.6	106.1

The monetary unit is the schilling, nominally 14.07c., but standing in 1936 at an average of 79% of its nominal value. The budget for 1936 showed a revenue of 1,282 million schillings and expenditure of 1,303 million schillings. The deficit of 21 million schillings was much smaller than that of any year since 1930, except 1932. Budget estimates for 1937 were: revenue, 1,342.1 million schillings; expenditure, 1,399.8 million schillings.

**Defence.**—Since denouncing the military clause of the Treaty of St. Germain on April 1, 1936, Austria has maintained compulsory military service for all males between the ages of 18 and 42. In 1936 the budgetary effectives were 1,362 officers and 35,160 other ranks. In Jan. 1937 it was decided to form the "Front-Militia" (the patriotic pan-military organization, voluntarily enlisted, standing behind the chancellor) into the reserve of the army.

**Automobile:** see MOTOR CARS; MOTOR TRANSPORTATION.

**Automobile Racing.** Captain George E. T. Eyston of England broke the world land speed mark over a measured mile on the Bonneville Salt Flats in Utah, U.S.A., driving his racing car "Thunderbolt" over the distance

at an average speed of 311.42 miles per hour. This easily shattered the previous record of 301.1292 miles an hour set on the same flats in Sept. 1935, by Eyston's compatriot, Sir Malcolm Campbell. Captain Eyston, prior to setting the new world speed mark, also broke three other standards—the 3,000 kilometres, 12 hours and the 2,000 miles. His average speed for the 2,000 miles was 163.75 miles an hour; his new mark for the 12-hour run was 163.68 m.p.h. and for the 3,000 kilometres, 163.49 miles per hour.

Wilbur Shaw of Indianapolis, Indiana, U.S.A., won the annual 500-mile Indianapolis auto racing classic, finishing first by the margin of an eyelash. Shaw drove his Shaw-Gilmore Special to victory over Ralph Hepburn of Los Angeles, who placed second. The time margin was 2.16 seconds. Shaw's time for the long grind set a new record for the speedway. He covered the distance in four hours, 24 minutes, 7.81 seconds, doing an average speed of 113.580 miles an hour. The previous average speed mark, set by Louis Meyer in 1936, was 109.069 miles per hour.

At the newly constructed Roosevelt Raceway in Westbury, Long Island, the second running of the revived Vanderbilt Cup race saw a German representative shoot to the fore. Bernd Rosemeyer, German champion, drove his rear-motor Auto Union to victory by the slim margin of 51.03 seconds over his nearest pursuer, Richard Seaman of England. Rosemeyer covered the ninety laps in three hours, 38:00.75 minutes at an average speed of 82.564 miles an hour. These figures bettered those of Tazio Nuvolari, the Italian racer who won the classic last year, by about 17 miles an hour. The first American car to finish was in sixth place, Russ Snowberger driving his Burd Piston Ring racer.

(T. J. D.)

**Aviation, Civil.** The regular air traffic has developed steadily. About 150 companies operated public air lines during 1937 in the whole world, including the operation of feeder services. Only about 25-30 of these companies have any international importance. The United States has about 24 air services (6-7 major ones) and Great Britain and Ireland have about 17 operating transport enterprises (2 major ones). The majority of the bigger air transport concerns are national enterprises partly or wholly owned by Governments and very often directed by Government officials as well.

**Commercial Development.**—An important development of commercial aviation has been the introduction of the "All-by-Air" mailing system for a number of international air lines. By this

BERND ROSEMEYER, Nazi racing driver, winning Vanderbilt Cup Race and more than \$20,000 at Roosevelt Raceway, Long Island, New York, July 5, 1937

THE "THUNDERBOLT," driven by Captain Eyston breaks the world's record with 311.42 miles per hour over a mile course on the Salt Flats, Bonneville, Utah

system all first-class mail is transported by air, usually with a restriction of the weight limit for a single letter, but without any special "Air Mail" labels, surcharges, etc. This system has already been introduced for the British mail to and from most Continental countries, to South Africa, for the mail between Holland and the West Indies, for some German lines and other scheduled routes as well.

The Pacific ocean has been conquered and many air liners have crossed the Atlantic. A big step towards the creation of a regular transatlantic air route connecting England with the United States was taken during 1937 by means of a number of successful experimental crossings on the northern Atlantic route to Newfoundland. These experimental flights were carried out by Imperial Airways and Pan-American Airways using normal transport flying boats.

The main difficulty of the important route between Europe and North America is the meteorological conditions encountered over the Atlantic. Knowledge of Atlantic weather seems still too restricted for a regular operation of a traffic schedule over such a long crossing. The experience gained jointly by Imperial Airways and Pan-American Airways during the summer of 1937 between Ireland and Newfoundland and between Bermuda and New York is therefore of special value. These experiments are being con-

tinued. The planes used have been four-engined flying boats. Bigger flying boats are in preparation in England and in the United States for the continuation of this service.

On the southern Atlantic route to North America via the Azores and Bermuda, the Deutsche Lufthansa has been operating experimentally with the help of catapult-carrying depot ships. These special ships are stationed at suitable points along the route and handle mail-carrying seaplanes. At present four of these ships are in service. The catapults are capable of launching aircraft of 17 tons all up weight. German passenger air services across the Atlantic will be continued with airships as long as no large aircraft are ready which can make the journey comfortable from the passengers' point of view and on a paying basis. For mail-carrying purposes both float planes and flying boats are being used.

The Atlantic route to South America is over a much shorter sea route, and is therefore a scheduled route. The French company, Air France, and the German company, Deutsche Lufthansa, compete with one another. A recent experimental flight with a four-engined land plane, capable of flying at 200m.p.h., from Paris over Dakar, Natal, Buenos Aires to Santiago (7,862mi. in 59hrs. with only 52hrs. flying time) seems to indicate that landplanes may be used for the Atlantic crossing as well as seaplanes or flying boats. The French service to South America is weekly.

Of special interest have been Russian experiments on a transpolar route from Europe to North America. Trial flights undertaken during 1937 were based on the results of a careful meteorological observation in the Arctic. The Russian floating meteorological observation station established on the ice near the North Pole has secured valuable information for a future air line across these regions.

The size of modern air-line operating companies is already considerable. In the United States, one of the biggest concerns, Pan-American Airways (P.A.A.) operates nearly 50,000 route miles with 224 airports, 138 ground radio-control and 124 meteorological stations, employing about 4,500 people and 150 modern air liners. P.A.A. established the service from California to China across the Pacific ocean, and the services between the United States and South America. The next extensions will be the air line across the northern Atlantic, and a service between the United States and Alaska. Large transatlantic flying boats for 100 passengers and a crew of 16 for 5,000mi. range are under construction. Trips round the world by air for a fare of £450 (\$2,255) are scheduled, taking 28 days including several days to be spent in cities along the route.

Private transport aeroplanes are coming more and more into use. Mining and other companies in all parts of the world operate freight-carrying aeroplanes, survey planes for land exploitation, oil pipe-line control, high-tension wire grids, and business

TRAVEL BY AIR in the United States: passenger-miles flown on scheduled airlines

executives are provided with their own passenger planes by their firms. Transport planes for the safe and quick distribution of valuable or perishable freight (press photographs, film pictures, gold and jewels, newspapers, flowers, fruits and vegetables, pharmaceutical drugs, etc.) are rapidly increasing in numbers. One special charter flight across the Atlantic for £40,000 has been accomplished for the transport of coronation films and press photographs between the United States and England.

Private passenger aeroplanes for air touring are not yet as common as private transport aircraft. This is due to the expense and the scarcity of aerodromes and licenced landing-grounds, but more largely to the fact that the piloting of an aeroplane still needs considerable skill and training. The progress of light and ultra-light aeroplanes has not been as rapid as might have been with the restricted market. The ultra-light aeroplane (about up to 40h.p. for a single-seater and up to 70h.p. for a two-seater) is well represented in the United States and seems to have given satisfactory results under a subsidy scheme in France, where during the first nine months of 1937 not less than 34,714hrs. have been flown and thousands of pilot certificates have been obtained.

**Technical Development.**—Generally speaking the technical progress in civil aviation has remained restricted to improvements of transport efficiency. Cruising speeds of 200m.p.h. are by no means exceptional today. Only five years ago top speeds of 125m.p.h. were considered good. Aero-dynamical improvements and progress in power plane development largely contributed to this rise in speed.

In spite of increased engine powers and pay loads, the modern air liner has not grown much in size, the wing becoming more heavily loaded than with earlier models. This trend to high wing loadings has caused the stalling speeds to rise, and the general aerodynamical refinement resulting in decreased air resistance has caused the gliding angles to become flatter. Despite the new general use of air brakes, flaps and slots, variable pitch propellers, supercharged engines, etc., the modern air liner has become more and more difficult to handle. The assisted take-off for heavily loaded high-speed commercial aeroplanes has been studied in England in connection with transoceanic services. An experiment now undertaken by Imperial Airways in collaboration with Short Brothers is the Mayo "composite aircraft," consisting of two planes coupled together for the take-off. The lower component of the arrangement at present under test is a lightly loaded big flying-boat. This lower component carries during take-off and initial climb the fully loaded transport seaplane which has to be started. The upper component to be released from the lower component is a four-engined float seaplane, the floats of which are resting in cradles mounted on the wing of the flying-boat. The pilots of both aircraft are in telephonic connection with each other while the upper seaplane is attached to the lower one. As the catch connecting the two aircraft during flight is released at a certain height, the upper seaplane is lifted away from the flying boat. (See also AERONAUTICS.)

The refuelling of commercial aeroplanes during flight by means of a tanker aeroplane offers possibilities of a take-off with a small fuel load only and would permit economical non-stop distance flights with pay loads. "Truck-launching" is another proposal for the assisted take-off. That means catapulting aeroplanes from a permanent way by means of a carriage provided with a turntable, on top of which the aircraft is resting.

The main problem of approach and landing has not yet been brought to any new solution, the speed ranges obtainable being not greatly improved against those of eight to ten years ago. Air brakes giving an increase of drag to steepen the glide, slots and flaps which not only steepen the glide but decrease the stalling speed by producing additional lift, are in common use with mod-

ern air liners. Wheel brakes are shortening the run after the touching down, and permit an effective control on the ground. The next step already incorporated in some air liners under construction is the three-wheel undercarriage with a steerable front wheel under the nose of the fuselage and the rear wheels arranged behind the centre of gravity of the aeroplane. Its advantages are the superseding of the "three-point landing" often followed by bouncing, and the stability on the ground during cross wind starts and landings. Retractable undercarriages as a means for reducing the drag are commonly used today.

Improvements in modern air liners concern the introduction of the automatic control or "gyropilot," an ingenious apparatus incorporating gyroscopes which steer an aeroplane automatically on a steady course at a given height and direction. This kind of control has proved especially valuable for blind flying and for long-distance flights. Progress in navigational means for blind approach and blind landing cannot, however, stand comparison with the aeromechanical improvement realized during the last years. In poor visibility landing is practically still largely unsolved. The Lorenz ultra short wave approach system, which defines the gliding path to be followed into the aerodrome, is in an advanced stage and holds out great possibilities. Modern wireless direction-finding apparatus still suffers from night effect and static trouble. Commercial aircraft crossing the sea over longer distances therefore prefer to rely on celestial navigation. A Telefunken device for combating the night error is under service trials. Screened and static-proof aerials are being introduced protecting against icing-up and static disturbances.

Electric discharges during flight are now more often experienced, due to the increased flying practice. Usually the effects are not serious, and remain restricted to shocks and damage done to wireless sets, but there is still the suspicion that certain very serious accidents, which are otherwise inexplicable, might have been caused by this reason. Ice accretion still remains a serious trouble. Ice prevention devices (de-icers) on wings, tailplanes, and airscrews are common with American and French aeroplanes. Imperial Airways and K.L.M., the Royal Dutch Air Line operators, are experimenting with ice-deterrent substances. Ice warnings are now issued by meteorological stations, and have been of great help to civil aviation. The operation of air liners at great heights near the stratosphere seems to become a practical proposition. This over-weather flying needs a special equipment which is now being developed by the American industry. The aeroplane must have air-tight cabins, for passengers and crew, supercharged to a pressure of about 6lb.-sq.in. for flying in a height of 20,000ft., getting fresh air and oxygen supply; care has to be taken to deal with temperature effects in the structure. The power plant has to be equipped with two- or three-stage compressors giving normal pressure in the intake manifolds. The advantages of flying at great heights are the very high speed obtainable, the fairly regular winds, the absence of gusts and ice accretion, and finally the possibility of celestial navigation under all weather conditions.

Serious problems are presented by the airscrew for big commercial aircraft. The variable pitch and especially the constant-speed airscrew have become a necessity for reasonable take-offs and good efficiencies at cruising speeds. The two-position controllable pitch airscrew is now being superseded by the constant-speed variety which eliminates adjustments by the pilot and which gives a gain in cruising speed efficiency. The mechanical difficulties inherent to variable pitch systems may be considered as overcome. But the trend to bigger engine units (from 1,400h.p. to about 3,000h.p.) in connection with gearing down, leads to airscrews having a big diameter and fairly high top speeds. This will mean an increase of airscrew-weight up to a considerable

THE ARROWBILE, a combination automobile and aeroplane, is driven into a hangar to be converted from motor car to flying machine by attaching wings

percentage of the whole plant weight and lowered efficiencies due to high top speeds. The protection against ice-accretion is still another insufficiently solved problem. Wooden blades, now considered obsolete except for small aircraft, may again be favoured because of their lower weight.

Important development work has proved its value for the comfort of passengers. Sound-proofing of cabins is common today, and controllable ventilation and heating. Adjustable seats facilitate travelling over long distances. Sleeper berths for night flying are not exceptional. Oxygen supply for passengers and crew of planes crossing high mountains is provided for.

Metallic materials (steels and light alloys) are used for the main structure of most air liners, while for small aeroplanes a mixed wooden-metallic construction is still preferred. One remarkable exemption is the four-engined de Havilland Albatross monoplane built for long-distance experiments of Imperial Airways. This modern air liner shows a refined wooden construction. Plastic materials (thermo-setting synthetic resins) may become important for structural parts as well.

The progress in power plant construction does not appear so obvious as the aerodynamical refinement. But there has been a steady improvement in aero engine design. The reliability and life of a modern aero engine have become astonishingly high. One engine extensively used for feeder line aeroplanes, the de Havilland Gipsy Major, is now officially permitted to run for 1,000 hrs. between overhauls. Only a few years ago the interval was 75 to 200 hrs., even for engine types which were reputed as reliable. The power developed has been pushed up by increased compression ratios (due to fuels proving a higher octane number), increased engine speeds, raised intake pressures (supercharger boost), and improved cooling of cylinder heads. Every engine installation is now provided with air ducts for the effective transmission of heat on radiators and fins. The research in anti-knocking fuels has played a big part in the general development. Fuels with an octane value of 100 (the octane value is a comparative figure stating the anti-knocking qualities) are under service tests, and those with 110 octane value and more are in preparation. A few years ago the average octane value was about 70.

Nearly all commercial and civil aircraft in the United States, Great Britain, Holland, and Switzerland are equipped with air-cooled engines, only Germany and France using liquid-cooled engines. The compression ignition engine (Diesel system) is only to be found on German air liners. The fuel consumption of the compression ignition engine is reputed to be low, and several German long-distance flights with Junkers Diesel engines seem to have proved it. But it may be pointed out that in fuels of a very high octane value, permitting high compression ratios without detonation, similar thermal efficiencies are obtainable with the gasoline engine.

The output of a cylinder is restricted by the heat conduct, and in this respect the cooling of exhaust valves is limiting the further progress. Sleeve valves help to overcome this difficulty, and air-cooled Bristol radial engines incorporating this principle have done extremely well. The future may show the sleeve valve air-cooled radial in competition with the liquid-cooled compression ignition engine for air liners. For small civil aeroplanes, air-cooled engines of the four- and six-cylinder in line type are dominating.

One of the most serious problems which still has to be solved is that of fire prevention. Crashes with modern high-speed aeroplanes are often followed by fire, the cause of which is not known in most cases. The only fact which is quite obvious is that fuel vaporized by the impact of the crash is ignited while mixed with air, explodes, and starts the fire. The most effective prevention seems to be the use of fuels which are less likely to form ex-

plosive mixtures while vaporized. Most heavy fuels used for compression ignition engines should satisfy this requirement. But the Diesel engine still seems to be far from being equal to the modern gasoline engine, even if the omission of electrical ignition is regarded as an additional factor.

**Airships.**—The commercial use of airships has remained restricted to Germany, in spite of the excellent results. The "Hindenburg" airship was laid up during winter months, and underwent modifications resulting in 20 additional passenger cabins, bringing up the total to 70 passengers. The use of Blaugas as part of the fuel was discontinued. The airship which had made so many successful trips across the Atlantic met with a terrible disaster on May 6, 1937, at Lakehurst, while landing shortly after a thunderstorm. In spite of this disaster Germany decided to continue the airship service. But the use of hydrogen which has been responsible for most airship accidents is now banned, and the new "L.Z. 131" under construction is being modified for a filling with helium. Helium gas means a certain loss in lifting capacity, but it is not inflammable.

**Special Aircraft.**—Gyroplanes, *i.e.* aircraft producing lift by revolving wings, have made good progress, but can still only be considered as being in the experimental stage for scheduled air transport. The Cierva "jump start" autogiro has been successfully demonstrated. The Hafner gyroplane has shown an exceptionally good manoeuvrability. The German Focke helicopter has made cross-country flights of 50 mi. length, and is at the present holding all world's records for helicopters. (See also GASOLINE; UNITED STATES: *Aviation*.) (A. R. W.)

**Aviation, Military:** see AERONAUTICS; AIR FORCES; MUNITIONS OF WAR; AIRCRAFT; REARMAMENT.

**Azana, Manuel** (1880— ), Spanish statesman and jurist born at Alcalá de Henares; studied at Madrid and Paris, became a barrister and, while a lecturer at Madrid University, contributed widely to the home and foreign press. He specialized in military subjects, was vehemently opposed to Primo de Rivera's dictatorship, was a strong anti-clericalist, and in 1930 joined the revolutionary committee which paved the way for the Republic. Arrested and imprisoned, he was released (April 1931) on the proclamation of the new régime, and, as Minister of War in the first republican ministry, quickly reduced armament expenditure. On Zamora's resignation (Oct. 14, 1931) he became provisional president, and in the following December president. His reforming zeal in social, military, religious, and educational spheres occasioned the opposition of both conservatives and radicals, and his ministry was marked by uprisings of Catalans, monarchists, and anarchists; in June 1933 he reorganized his cabinet, but resigned in September, being succeeded by Lerroux. In 1934 the Catalan rebels nominated him head of their proposed provisional Government, but he was arrested and imprisoned for 10 weeks (October–December); in March 1935 he was again arrested on the accusation of having rendered assistance while in office to Portuguese revolutionaries, but the charge was allowed to drop, and on May 10, 1936, he succeeded Zamora as president of the Republic. During the Civil War he was forced to move from place to place with the Government, and used his best endeavours to restrain extremist groups. (See also SPAIN; SPAIN, CIVIL WAR IN.)

**Azerbaijan S. S. R.** A Soviet republic, a member of the U.S.S.R. (*q.v.*), in Eastern Transcaucasia on the Caspian sea, bordering N. on Georgia and Daghestan, W. on Armenia, and S. on Iran. The capital is Baku, the oil metropolis; and the national flag has a red ground,

with a gold sickle and hammer and initials top left corner. The leading cities, with 1936 population figures, are: Baku 702,000, Kirovabad (formerly Gandzha) 90,700, Nukha 30,900.

**Area and Population.**—Area: 86,000 sq.km. Population (1933): 2,891,000 (rural 1,921,000, urban 970,000), comprising about 20 nationalities altogether, with 63.3% Turkish, 12.4% Armenians, and 9.7% Russians. The chief languages are Azerbaijani, Armenian, and Russian. The total number of pupils attending schools (1936–37) was 549,000, and there are 13 higher educational institutions with 11,000 students, and 87 research institutions.

**History.**—The Ninth Extraordinary Azerbaijan Soviet Congress, sitting in Baku, adopted on March 14, the new Constitution of Azerbaijan, which thenceforth belongs directly to the U.S.S.R. as an equal, independent Union Republic. The Azerbaijan S.S.R. includes the Nakhichevan Autonomous S.S.R., the Nagorno-Karabakh Autonomous Province, 50 districts, and the capital Baku. About ninety-six per cent of the population took part in the elections to the Supreme Council of the U.S.S.R. on Dec. 12.

**Trade and Communications.**—Sown area (1936): 4,318 square miles. In 1937, 86.5% of peasant households were collectivized. The chief products are cotton, rice, fruit (especially grapes), and, in the south, tea, citrus, and silk. Stock breeding (especially horses) is an important activity. It is the chief oil territory of the U.S.S.R., and also has iron strata. The output of industry (1936—at prices 1926–27) was 2,054 million roubles. There were, in 1936, 847km. of railways. (S. YAK.)

**Backward Children.** The term backward child is gradually disappearing. The principal uses of the expression have been in connection with school achievement and in intelligence. In school parlance, a child is backward when he is two or more years behind the grade he should be in. In intelligence, the term is sometimes used to indicate a child whose I.Q. is between 80 and 90. This, however, is not standardized. In popular usage, it is often a euphemism for feeble-minded. Otherwise it is a general expression for all cases that for any reason do not seem to be up to expectation.

We have now learned that the backward child (in this latter sense) is generally a discouraged child. The discouraged child makes no effort to achieve. Impatient teachers scold and threaten him, call him a dunce or tell him he is stupid until he thinks it is no use to try to please them. Sometimes it is a physical handicap which no one has taken the trouble to discover and remove, such as adenoids, crippled condition, poor nutrition, poor home, poor clothes and other conditions that destroy a child's self-respect and interest in life.

Parent-teacher associations, guidance clinics, school counselors, school nurses, visiting teachers and, best of all, the elimination of the scolding, nagging teacher, all are contributing to prevent discouragement and reduce the number of backward children. Slow children, there will always be; but as long as they are not feeble-minded they need not be called backward any more than the adult should be called backward who does not work as fast or achieve as much as some other adult. (H. H. Go.)

**Bacon.** Sliced bacon to the amount of 219,541,363lbs. was produced in the U.S. in 1937, an increase over preceding years that evidenced both the growing popularity of this form of bacon and the ingenuity in new styles in packaging the product temptingly. This figure, from the U.S. meat inspection service, is believed to represent 95% of the sliced bacon produced in the U.S. in 1937. It also represents roughly close to 65% of the smoked bacon produced in the U.S., according to an informed staff member of the *National Provisioner*. The number of hogs

slaughtered in the U.S. in 1937 was 31,642,000. Average production of bacon is about 25lbs. to the hog. On this basis bacon production in the U.S. in 1937 totalled approximately 790,000,000 lbs., including sliced, smoke-cured bellies and dry-salt cured.

Improvements in curing have been developed by packers to prevent rancidity in sliced bacon. Experiments at the University of Illinois have demonstrated that flour made from oats counteracts rancidity.

Approximately 2,000,000lbs. (1,916,800lbs. for the first eleven months) of bacon was exported by Canada to the U.S. in 1937. This included the usual types of smoked bacon and also the all-lean "Canadian" bacon which has gained popularity in the U.S. in recent years and which is officially termed "Canadian style" bacon by the U.S. meat inspection service. There is confusion in the terms signifying bacon in different countries, and "Canadian" bacon, which is made from loins, is much different from U.S. bacon which is made from bellies. The importation of 2,000,000 lbs. of Canadian bacon into the U.S. was part of the year's pork importations, which, for the first time in history, exceeded exports of pork from the U.S.

Despite the contention of Canadian growers that Dominion bacon is second to none, Danish bacon continues to rank first in popular favour in the United Kingdom. U.S. bacon does not compete against either the Danish or the Canadian in the British market because it is of a fatter type. While swine breeding in the U.S. has produced bacon-type pigs they are still nearer to lard-type swine than are the Danish and Canadian pigs which are grown primarily for bacon and ham, lean meat. (S. O. R.)

**Bacteriology.** Amongst the new species described in 1937, the sulphur bacteria are represented by *Thiospirillum pistiense*, a thermophilic, autotrophic sulphur oxidizing organism found in hot springs. Bacteria of this type grow at abnormally high temperatures and do not use organic substances for food. *Bacillus thiocyanoxidans*, which could oxidize thiocyanates to sulphates, was isolated from gas-works liquors. *Proteus melanovogenes*, a soil and manure organism, was found to be responsible for a black rot of imported eggs.

Several new plant pathogens have been described. Amongst these the following caused leaf-spot diseases: *Bacterium flavozonatum* (Begonia), *Phytomonas lactucaescariolae* (wild lettuce), *Phytomonas primulae* (Primula), *Phytomonas geranii* (Geranium), and *Bacterium tardicrescens* (Iris). *Phytomonas fabae* was found to be the cause of a black stem rot of *Vicia faba*, and *Bacterium pseudotsugae* produced galls on Douglas Fir. New animal pathogens included Gram-negative cells, less than half a micron in diameter and considered to be intermediate between the viruses and the bacteria, causing mouse catarrh and fowl coryza. *Serratia anolium* caused tumours in lizards. Four new species of *Salmonella* (typhoid and paratyphoid bacteria) were recorded.

Concerning the growth of bacteria, the gamma rays from radium were shown to inhibit cell division but not increase in cell volume in *Bacterium coli*, so that long filaments resulted. Pimelic acid, nicotinic acid, and  $\beta$ -alanine were all necessary growth factors for the diphtheria bacillus. Uracil was essential for the growth of *Staphylococcus aureus* in the absence of oxygen, whilst nicotinic acid and vitamin B<sub>1</sub> were required for the aerobic growth of the same organism. The V factor necessary for the growth of *Haemophilus parainfluenzae* could be replaced by purified codehydrogenases. These are activators of the dehydrogenase type of enzyme, namely, enzymes catalysing the removal of hydrogen from organic substances. Lactic and propionic acid bacteria also required growth factors. Nutrient broth has been shown to contain substances which inhibit toxin production by *Staphylococci*

and sporulation by *Bacillus subtilis*. These substances could be removed by adsorption on cellophane and charcoal respectively. From the Crown Gall organism, *Bacterium tumefaciens*, a complex endotoxin capable of producing tumours in sunflowers has been extracted. This organism also produces  $\beta$ -indolacetic acid, which itself can cause tumour formation in a number of plants.

The bacteriorhizas (mixed bacteria closely associated with roots) of various seedlings have been shown to stimulate the germination of seeds, and by the use of strains of bacteria capable of dissolving fungi the incidence of fungal disease in seedlings has been reduced. The root secretions of maize and wheat have been found to inhibit the growth of the nitrogen-fixing organism *Azotobacter*. Also, the secretions from pea roots exerted a deleterious influence on beneficial soil bacteria. Finally, a protein possessing the properties of Bacteriophage, the mysterious and apparently living agent which causes the destruction of bacteria, has been isolated. This protein had a molecular weight of 500,000, and was active in the incredibly small dose of one million millionth of a milligram. (S. E. J.)

## Badminton.

Badminton suffered a great loss during the year in the death, on Nov. 28, of Mr. F. W. Hickson, a tireless Hon. Secretary of the Badminton Association for 10 years. The position is now filled by Mr. D. L. H. Mercer, the well-known Hornsey cricketer.

The steady growth of the game was maintained during the past year, the latest figures showing that in England alone there are 1,229 affiliated clubs.

The playing side of the game suffered a loss, too, when Miss Thelma Kingsbury, the ladies' singles champion and joint holder, with I. Maconachie of Ireland, of the mixed doubles title, became a professional, and followed so many of England's best professional players to the U.S.A. and Canada.

The reigning open champion is R. C. F. Nichols, who, in partnership with his brother L. Nichols, also won the men's doubles title. The ladies' doubles title went to Mrs. Uber and Miss D. Doveton. Cambridge won the University match for the eighth consecutive year, while the county championship also followed the usual course and was won by Middlesex. It is hoped to organize a second-team Inter-County championship.

Recent rule changes have been mostly of a superficial nature. Throughout the rules the word "point" is now substituted for the word "ace." For the purposes of ladies' singles matches, when the score is 9-all, the game may be "set to 3" (formerly the number was "5"), and at 10-all the game may be "set to 2" (instead of "3"). This change was made with a view to increasing the popularity of ladies' singles contests.

## Bahamas,

a British colony and island group east and south-east of Florida; language, English; capital, Nassau (pop. 19,756); governor, C. C. F. Dundas; area, 4,404 square miles. Population, 59,828 (1931 census); (official estimate, 1936) 66,219. The Government is administered by an appointed governor and legislative council and an elected assembly. The chief events of note in 1937 were the appointment, in May, of C. C. F. Dundas as governor, succeeding Sir Bede Clifford, and a spectacular and serious riotous outbreak on Great Inagua, the most southerly island, in August, during which one person was killed and 15 deported by the rioters. Five steamship lines call regularly at New Providence, and semi-weekly air communication (daily in winter) is maintained with Miami. In 1936, imports were £967,240, principally from the United States (42.9%), Great Britain (24.6%), and Canada (13.4%); exports were £142,104: United States (36.8%); Canada (24.1%); and Great Britain (16.5%). The "unfavourable" trade balance was offset by a

## BADMINTON—BALANCE OF TRADE

growing tourist trade, valued at £1,000,000 annually, and increasing real estate investments. Principal export commodities were sponges (38.5%), fresh tomatoes, especially to Canada (19.3%), hemp (10.5%), and lumber (8%). These commodities and fish for local consumption, with an annual catch estimated in value at £22,500, were the chief products. The monetary unit is the pound sterling (\$5). Colonial revenue for 1935-36 was £453,310, and expenditures, £426,909. In 1936 there were 166 elementary schools (enrolment, 14,734), an industrial school, and five secondary schools. Approximately 5% of Government expenditure was for education. (L. W. BE.)

## Bahrein Islands,

in the Persian gulf, are under the protection of Great Britain. During 1937 there was a steady increase in agriculture and in trade. Artesian wells were sunk to provide ample water in the towns, and for land which had previously been uncultivable. The Bahrein Petroleum Company opened a refinery in December capable of producing 25,000 bbls. a day; and a causeway, one and a half miles long, between Manamah, the capital, and Muharra, the adjacent island, has been completed except for one bridge.

## Baker, George Fisher

(1878-1937), American financier, who inherited a fortune of \$60,000,000 from his father in 1931 and since then had been chairman of the board of the First National Bank of New York. He was a director of a number of the largest American corporations, such as the American Telephone and Telegraph Company, General Motors Corporation, the United States Steel Corporation, and the New York Central Railroad Company. He was born in New York city, March 19, 1878, and received his A.B. degree from Harvard in 1899. He died, May 30, 1937, in Honolulu after an operation.

## Baker, Newton Diehl

(1871-1937), U. S. lawyer who served as secretary of war during the World War, was born at Martinsburg, W. Va., Dec. 3, 1871. An account of his services as secretary and as solicitor and mayor of Cleveland, Ohio, may be found in the *Encyclopædia Britannica*, vol. 2, p. 944. With the end of the Wilson administration in 1921, he returned to Cleveland where he became known for his legal services for large corporations. In 1928 he accepted appointment to the Permanent Court of Arbitration at The Hague in the hope of forwarding peace. His public services became even wider after he received a Distinguished Service medal in 1929 for his war work. He headed the National Crime Commission, accepted membership on the National Law Enforcement Commission, was the recipient of numerous awards for public services, led the national committee for the mobilization for human needs during 1931-33, and was re-appointed to The Hague in 1935. A prominent candidate for the Democratic presidential nomination in 1932, he worked on early New Deal labour committees but became critical of such measures as the TVA, supreme court changes and the Wagner Labor Relations Act. His death occurred in Cleveland, Dec. 25, 1937.

## Balance of Trade.

The course of national balances of payments in 1937 was affected by a number of general factors; the rapid rise of world prices for raw commodities in the first four months of the year and their subsequent decline; the accelerated internal economic activity of manufacturing countries, especially under the stimulus of expenditure on arms; the efforts of certain countries to reduce their dependence on imported raw materials; the higher level of shipping freights as world trade expanded faster than the available

tonnage; the wars in China and Spain, and other political disturbances. Currency movements seem not to have played as great a part as in earlier years; nor was there, in 1937, any outstanding migration either of long-term or of short-term capital.

**United States.**—Both imports and exports of the United States showed a big increase. Retained imports, from a monthly average of \$202 millions in 1936, rose to \$296 millions in March. Higher prices and increased consumption both contributed to this movement. Exports increased from a monthly average of \$201 millions in 1936 to \$285 millions in May 1937. Both sides of the account then receded, but exports returned seasonally to a high figure in the autumn. Exports from January to September totalled \$2,238 millions, against imports of \$2,370 millions. In the same period there was a net import of \$1,455 millions of gold. This was not the counter-part of a long-term capital movement; the net inward movement was only \$231 millions to June 30, and in later months capital left the United States. To that date, however, there had been a net inflow of \$708 millions of banking funds, enough to balance two-thirds of the payments for gold.

**United Kingdom.**—Imports into the United Kingdom continued to expand, despite falling prices, from a monthly average of £65,710,000 in 1936 to £91,945,000 in Nov. 1937. Exports also increased, but not in such large measure; the debit balance of trade for the first 11 months of the year was £387,208,000 in 1937 against £311,022,000 in the same period of 1936. It was estimated that roughly £30 millions of the increased debit would be covered by higher shipping earnings (yielding £95 millions in 1936) and roughly £20 millions by bigger dividends on investments abroad (yielding £195 millions in 1936). As there was a simultaneous net import of about £80 millions of gold, Britain's liabilities to the outside world were plainly increasing faster than her external assets.

**Gold Bloc.**—The effect of devaluation on France's balance of trade was not, as might superficially have been expected, a check to imports combined with a stimulus to exports. Imports rose faster than exports, from a monthly average of 2,117 million francs in 1936 to one of 3,347 million francs in the first nine months of 1937, the corresponding figures for exports being 1,288 millions and 1,871 millions respectively. This increase of 647 million francs in the monthly trade debit was offset by a great curtailment of exports of capital. Other former gold-bloc countries fared similarly. Thus the monthly average debit on the Netherlands' foreign trade rose from 22.5 million guilders in 1936 to 33.4 millions in the first nine months of 1937, and in Switzerland the corresponding rise was from 32.05 million francs to 48 millions. Belgium, which had devalued her currency a year before the others, also underwent a slight increase in her debit balance of trade early in 1937. The tendency of imports to rise faster than exports in industrial countries was a natural outcome of higher prices for raw products, and of increased internal activity.

**Scandinavia.**—The Scandinavian countries may be taken as another typical group, their chief exports being timber, dairy products, and other high-class foodstuffs, with some industrial manufactures. Their currencies were all linked to the pound sterling. Denmark, Norway, and Sweden had the same general experience, namely, a sharp rise of imports towards the end of 1936 and the beginning of 1937, followed after an interval by an almost equal (in Sweden, a greater) rise of exports. The net result was a slight increase of their monthly debit balances of trade in the first nine months of 1937 compared with the 1936 average, thus: Denmark, 12.7 million kroner, compared with 8.7 millions; Norway, 41.6 million kroner, compared with 19.8 millions; Sweden, 14.7 million kronor, compared with 11.5 millions. These increased debits were probably fully covered by larger invisible income, notably shipping earnings.

**Germany, Italy, Russia, etc.**—In 1936, Germany had maintained a credit balance of trade averaging Rm.45 millions a month. Higher commodity prices caused some inroad on this, but Germany's export business shared fully in world trade revival, and in the first nine months of 1937 her average credit was Rm.34 millions. The four-year plan of self-sufficiency had yet had little total effect on her balance of trade. Italy, on the other hand, failed to maintain her trading position, despite the devaluation of the lira. Her monthly average of exports rose from 455 million lire in 1936 to 855 millions in the first nine months of 1937, but imports more than doubled in value—from 501 million lire to 1,152 million lire a month. As a result, Italy's book balance on her exchange clearings changed from a credit of 529 million lire in Dec. 1936 to a debit of 253 million lire 11 months later. On the whole, the smaller countries of central and eastern Europe had a more favourable trading experience in 1937 than in 1936, a bigger surplus becoming available for debt service. Russia's position also improved, her imports being practically stabilized and her exports responding to favourable market conditions for wheat, oil, gold, etc.

**Australia, Argentina, etc.**—The typical experience of countries exporting mainly foodstuffs and raw materials was a high level of exports in late 1936 and the first half of 1937, followed by a recession, while imports remained at an expanded figure, thanks to greater internal purchasing power. Thus, Australia's exports, which had totalled £A23,700,000 in April, May, and June 1936, rose to £A35,300,000 in the same months of 1937. By Sept. 1937, however, the increase was less than £1 million a month, while imports were £2,400,000 (sterling) higher than in Sept. 1936. New Zealand's position was similar. Argentina's exports were actually lower in Sept. 1937 than a year previously, and imports had almost overtaken exports; her credit balance in the earlier period, however, had been abnormally high. Although Brazil's export expansion was longer maintained, she, too, underwent a substantial and continuing rise in imports.

**China and Japan.**—Up to the outbreak of war, China shared in the general expansion of world trade, the monthly average of imports rising from \$78.5 millions (standard dollars) in 1936 to \$104.3 millions in the first seven months of 1937, while the export average rose from \$58.8 millions to \$81.7 millions. In the subsequent three months, imports averaged \$42 millions and exports \$53.7 millions. High prices and defensive preparations caused a great expansion of Japan's imports early in 1937, but, on the other hand, her exports were well maintained despite the war. Monthly averages were as follows: Imports—1936, 225.2 million yen; Jan.–July 1937, 352.7 million yen; Aug.–Oct. 1937, 274.8 million yen. Exports—1936, 219.3 million yen; Jan.–July 1937, 253.3 million yen; Aug.–Oct. 1937, 285.2 million yen. For both countries it will be seen that the immediate effect of the war was to reduce purchasing power more than exporting power.

There were, broadly speaking, two phases of the movement of world balances of trade and other international payments in 1937, corresponding to the movement of raw commodity prices. In the first period, the primary producing and debtor countries accumulated increased credits, part of which had to be used for higher dividend and interest payments. The second period marked a new equilibrium, with the trade advantage turning on the whole in favour of the manufacturing creditor countries, since the spending capacity of the other group remained at its expanded level, while imports of food and raw materials were costing less.

(H. V. H.)

**Baldwin, Stanley Baldwin,** 1ST EARL, of Bewdly, Viscount Corvedale (1867–), British statesman (see *Encyclopædia Britannica*, vol. 2,

p. 967), was, following Mr. Ramsay MacDonald, prime minister from June 7, 1935, until his retirement on May 28, 1937, when (June 1) he was created a Knight of the Garter (Mrs. Baldwin being created G.B.E.) and (June 8) raised to the earldom. Lord Baldwin had been premier in four administrations, and for a longer period than any premier of recent times, Mr. Asquith excepted. His latter months of office were rendered exceptionally arduous by reason of the abdication (*see* WINDSOR, EDWARD, H.R.H. THE DUKE OF), and his duties in connection with the coronation, and, after taking his seat in the House of Lords (June 9), he enjoyed a well-earned rest. On Nov. 5 he was given a civic reception at the Guildhall, London.

**Balearic Isles.** A group of four large and eleven smaller islands lying in the western Mediterranean off the east coast of Spain, to which they belong, and of which they form a province. The larger are Majorca (1,312 sq.mi.), Minorca (278 sq.mi.), Iviza (230 sq.mi.), and Formentera (35 sq.mi.); the total area is 1,935 sq.mi., and the estimated population at the end of 1934, 376,735. Palma, the capital, on Majorca, is 133mi. by sea E. of Valencia, and 144mi. S. of Barcelona. The only other town of importance is Port Mahon, Minorca, one of the finest harbours in the Mediterranean, and, unlike Palma, heavily fortified.

On the outbreak of General Franco's rebellion in July 1936, all the islands, Minorca excepted, declared for the insurgents; within a few weeks Iviza and Formentera were taken by the Catalans, their attack on Majorca being a costly failure; but before the end of November, these islands were occupied by Italians as air and naval bases in the insurgents' cause. Questions were asked in the British House of Commons relative to this, and in the "Gentlemen's Agreement" of Jan. 1937, Italy assured Great Britain that she had no intention of disturbing the *status quo* in the western Mediterranean. Months later, on Oct. 18, the insurgents' headquarters, in consequence of reports of Italian activities in the Balearics and of a rumour of a suggested Anglo-French occupation of Minorca, announced that no cession of the islands, nor any measure of foreign control therein, would be permitted.

Meanwhile, many "incidents" had occurred: on March 30 the Government fleet shelled Majorca and Iviza; on May 24 and 26 Government planes bombed vessels in the harbour of Palma, killing six Italian naval officers and wounding others; and on May 30, the German battleship "Deutschland" was bombed off Iviza, with 26 killed and 71 wounded, an action which resulted in the bombardment of Almeria by German warships the following day. Early in August there was a recrudescence of air attack on vessels both north and south of the Balearics, and on Oct. 25, following an attack by an unknown plane on the Air France base in Minorca, France arranged for the convoy of all merchant ships from France to North Africa and for a warship to be stationed permanently off Minorca.

By early November, the Italian forces would seem to have evacuated Majorca, and Palma now became the chief Nationalist base for the blockade of the Spanish east coast and Minorca. (*See* also SPAIN, CIVIL WAR IN.)

**Balkan Entente,** a regional political understanding which came into being on Feb. 9, 1934, between Greece, Rumania, Turkey, and Yugoslavia, by the signature of a "Pact of Balkan Understanding" providing for a mutual guarantee by the contracting parties of all their Balkan frontiers, with consultation and a promise to abstain from independent action towards any Balkan Power not signatory to the pact. A secret protocol provided for joint action if any signatory were victim of aggression by a non-Balkan Power, and a Balkan Power joined in

the aggression; a further, still more secret protocol, precised measures to be taken against Bulgaria if the eventuality arose.

A permanent council, permanent secretariat, and permanent economic council were established. The councils have met regularly; in moments of crisis, such as the murder of King Alexander of Yugoslavia, the desired unity of front has been maintained. The economic council has developed much activity in discussing the economic and financial relations between the signatories, improving communications, developing tourist traffic, etc.

It was no secret that when the pact was negotiated Yugoslavia was most anxious to include Bulgaria who found herself, however, unable to guarantee frontiers which she believed to be unjust. Yugoslavia subsequently negotiated a separate treaty with Bulgaria (*see* BULGARIA). The chief misgivings felt in Greece were due to the fear that she might be involved by the pact in war with Italy; the Italo-Yugoslav agreement (*see* YUGOSLAVIA) largely removed these fears. For texts see *Documents on International Affairs*, 1933, pp. 408-9, and 1934, pp. 298 ff. *See* also *Survey of International Affairs*, 1934, pp. 508 ff. (C. A. M.)

**Ballet,** understood as co-ordinated dancing and miming by a troupe of dancers, not the intimate art of an individual (*see* DANCING), enjoyed an increasing vogue in Europe and America in 1937. While the traditional classical style held its own, much contemporary work was seen. Examples indigenous to America were Catherine Littlefield's creations, as director of the Philadelphia ballet, of *Barn Dance* (fantasy on popular airs and figures of the pre-jazz era), *Terminal* (railway-station burlesque, to "hot" music), and a new, cumulative version of *Bolero* (Ravel). This very well drilled but spirited company visited Paris and London, while Col. De Basil's *Ballets Russes* were seen in America. Agnes de Mille, the American character-dancer, besides giving solo seasons in London, participated in English productions.

In Europe, countries with State-aided ballet, such as Austria, Lithuania, and Denmark, maintained their traditions; Poland entered the field. The Moscow State schools trained excellent dancers, but artistic enterprise was ruled by propaganda. Italy produced nothing new of distinction for an exquisite Roman *ballerina*. In France, at the Paris Opéra, Serge Lifar's *Icare* and *David Triomphant* won success; he also made some interesting experiments in the substitution for music of mere rhythmic and percussive sounds. The cream of the year's art, international and native, was seen in London.

Here the former was represented by the *Ballets Russes* (Marsine, *maitre*), who gave their fourth summer season at the Royal Opera House, Covent Garden, as before, collaborating in certain operas towards the close of the "grand" season, and returning thither in the autumn in brilliant revivals such as *Petrushka* and *Scheherazade* (supervised by their creator, Fokine) and *Le Coq d'Or* (reworked as ballet only); and by René Blum's *Ballets de Monte Carlo* (Fokine, *maitre*) at the Coliseum. The allied activities of the English school of ballet centred around Sadler's Wells theatre, the Ballet Club at the little Mercury theatre, and the *Ballet Rambert* (season at the Duchess theatre), giving scope to Ninette de Valois, Marie Rambert, Frederick Ashton, and others, as choreographers.

A significant recent development has been the "setting to motion" of recognized masterpieces of music, symphonic and other, led by Massine with his *Choreartium* (Brahms's Fourth Symphony) and *Symphonie Fantastique* (Berlioz), presented in a perfected version; Mozart's G minor Symphony is engaging his attention. The tendency remains general, as witness Fokine's *Les Elements* (Bach's B minor Suite) and *Les Elfes* (Mendelssohn's *Midsummer Night's Dream* Overture and Violin Concerto), and

Lichine's *Francesca da Rimini* (Tchaikovsky's Tone-poem); even Mahler's *Kindertotenlieder* and Schubert's *Death and the Maiden* Quartet were pressed into service.

Nevertheless, the outstanding achievement of the year was *Checkmate*, an original conception by Ninette de Valois and Arthur Bliss, the English composer, who worked out a chess-board duel between Love and Death. This was first produced by the Sadler's Wells company on their visit to Paris in June, who thus secured an international reputation after an existence of only five years; it scored a great success later in London. Other noteworthy productions by Sadler's Wells were *Wedding Bouquet* (a satire on Edwardian manners by Lord Berners and Ashton, with words for chorus by Gertrude Stein), and *Les Patineurs* (a Meyerbeer-Ashton essay based on skaters' movements in the manner of *Les Sylphides*).

The Markova-Dolin company flourished under a new *maitresse*, Bronislava Nijinska, Susan Salaman's circus-frolic, *Show Folk*, and Keith Lester's *David* here typifying modern work. A curious innovation, which awaits the development of a specialized technique, was ballet skated on ice at Covent Garden. (H. Fw.)

On Jan. 24, at the age of 67, Nicolas Legat died in London, where he had been teaching for some years. He was a famous dancer and teacher of the old Imperial Russian ballet, and among his pupils in Russia he numbered Kchessinska, Preobrajenska, Trefilova, Pavlova, Karsavina, and Nijinsky.

In November Prince Serge Wolkonsky died in Richmond, U.S.A., at the age of 79. He was director of the Imperial theatres in Russia in 1901-02, and was an ardent reformer of the ballet.

On Nov. 25, Miss Lilian Baylis, who had done so much for ballet at Sadler's Wells died at the age of 63 in London. (See also DANCING; MUSIC.)

**Baltimore**, the metropolis of Maryland, is situated at the head of navigation on the Patapsco river, an estuary of Chesapeake bay. It has an area of 91.93 sq.mi. and a population of 855,127 (U.S. estimate, 1937) of which 688,290 are white and 166,837 coloured. Birth rate, 1937, 14.5; mortality rate, 1937, 13.4. The shore line of the harbour inside the city limits is 37.7mi. and there are many square miles of deep water anchorage immediately below the city.

**History.**—Mayor, Howard W. Jackson; comptroller, R. Walter Graham; president of the city council, George Sellmayer. All terms expire in 1939. Bonded indebtedness (Nov. 1937) \$182,434,579. Assessed valuation of taxable property (1938) \$1,959,566,194. Appropriations for municipal purposes for 1938, \$47,414,286. A program (\$32,000,000) of public works, including water works, bridges, street widenings and extensions to facilitate motor traffic is in progress.

During 1937 the Pan-American Airways chose the Baltimore municipal airport as the base for its regular Bermuda service in conjunction with Imperial Airways and regular flights began Nov. 14. The year saw, also, the first appointment of a Negro to the police force, the adoption of voting machines for all elections, the continuing substitution of buses for trolley cars and the razing of hundreds of buildings in the older parts of the city to make space for the parking of automobiles.

**Education.**—Among the educational institutions in Baltimore are Johns Hopkins university and medical school; Goucher college; the University of Maryland (professional schools); University of Baltimore; Morgan college (Negro); the Peabody Conservatory of Music; the Maryland Institute of Art; the Enoch Pratt library and the Peabody library. There are two notable public art collections, the Walters Gallery and the Baltimore Museum of Art, as well as several smaller ones. The city maintains a symphony orchestra supported by municipal appropriation,

with Werner Janssen as guest conductor for the 1937-38 season.

**Manufactures.**—1,928 establishments, employing an average of 86,088 persons produced products valued at \$627,325,704 in the Baltimore area in 1935. In Baltimore city proper the total value of manufactured products reached \$538,804,929 the same year.

Water-borne commerce, as always, is the backbone of the economy of Baltimore. Foreign trade, 1937: Exports \$107,677,251; imports, \$100,059,188. Coastwise trade (Atlantic and Gulf) increase of 33% over 1936. Intercoastal trade (Atlantic and Pacific) increase 50%.

(H. Ow.)

**Baluchistan.** A mountainous country lying on the Arabian sea, between Persia and India. The total area is 134,638 sq.mi., and the total population 868,617. The tract is divided into: (1) British Baluchistan (area 54,229 sq.mi.; pop. 463,508, of whom 87% are Moslems), a minor Indian province with its capital at Quetta, and (2) a number of semi-independent States under British influence, of which the chief are Kalat and Las Bela.

The country is inhabited by two distinct races, the Brahui and the Baluch, the language of the former providing anthropologists with a problem of peculiar interest. The province is under a chief commissioner, responsible to the Government of India, and has not yet been made autonomous, though a movement is on foot for enlarged political rights.

On May 1, 1935, the town and cantonment of Quetta were ravaged by an earthquake which killed 30,000 out of the 70,000 inhabitants. The seat of the administration was temporarily moved to Karachi, but active measures were pursued during 1937 to restore the devastated area.

(ME.)

**Bananas.** A year described as average was reported in 1937 in most of the banana-producing countries. There was some loss from blowdowns in Jamaica and from cool weather in Mexico. The so-called Segatoko leaf spot disease (*Cercospora Musae*) was reported as being satisfactorily cleared up by spraying and dusting with fungicides. The United Fruit Company, which has 99,934 acres of bananas in Central and South America, reported shipments of 57,846,216 bunches of bananas in 1937, compared to 52,988,000 in 1936. Shipments to the United States and Canada in 1937 were 36,875,922 bunches, compared to 34,025,426 stems in 1936. The company reported its European shipments as 20,970,294 stems in 1937 and 18,963,537 in 1936. Further data for 1937 are not available but figures for previous years show that the Caribbean countries export approximately 80,000,000 bunches of bananas or more annually, with the leading producers being Jamaica, Honduras, Mexico, Colombia, Panama, Cuba, Guatemala, Guadeloupe and Nicaragua.

**Bankers Association, American:** see AMERICAN BANKERS ASSOCIATION.

**Bank for International Settlements.** In comparison with previous years the business activities of the bank in 1937 have shown a marked increase. To some extent this is reflected in the balance sheet, which rose from 604.9 million gold Swiss francs at the end of Nov. 1936 to 653.3 million gold Swiss francs at the end of Nov. 1937; and this increase has occurred in spite of the fact that the holdings of such currencies as have been subject to depreciation represent a lower gold value. The volume of operations has increased as a result of the large movements of funds between different countries and the uncertainty that, especially at certain periods, prevailed on the foreign exchange and gold markets. Gold is being used increas-

ingly for monetary reserves and for the settlement of international balances; this means that central banks have to procure foreign exchange against gold and gold against foreign exchange in order to be able to intervene on their own exchange markets; the bank has had its share of the business resulting from such operations. It should also be mentioned that the bank has devoted increased attention to the possibilities of financing foreign trade, particularly in relation to countries with exchange control; it has been possible to arrange certain facilities to aid exports by means of credits obtained from central banks in addition to the resources of the bank itself. Though the amounts involved are still moderate, the transactions that have been set on foot can be regarded as an attempt to find suitable methods of providing credits for export trade when ordinary financing meets with great difficulties. The net profits for the fiscal year April 1936 to March 1937, after making allowance for contingencies, amounted to a little more than nine million gold Swiss francs, approximately the same as those for the preceding year.

The bank has continued to serve as a centre of contact between central banks and, in a period of great uncertainty as to the future of the monetary mechanism, this contact has been greatly appreciated, as is shown by the fact that none of the central bank governors who are members of the board has been absent from a meeting during the year. At the general meeting in May 1937, Dr. L. J. A. Trip, governor of the Nederlandsche Bank, resigned his position as president of the Bank for International Settlements and Dr. J. W. Beyen was appointed in his stead. By a modification of the statutes, a separate chairman, in the person of Sir Otto E. Niemeyer, was appointed to preside over the meetings of the board. (P. J.N.)

## Banking.

Structural trends evident in 1935 and 1936 continued during 1937 to decrease the number of commercial banks in operation in the United States. As a result of failures, voluntary liquidations, and consolidations the number of such banks fell from 15,116 on Dec. 31, 1936 to 14,878 on Nov. 30, 1937, the latest date for which figures are available. The number of mutual savings banks in operation on Dec. 31, 1937 was 562, one less institution than was operating at the end of the previous year.

Most significant of the bank asset trends during 1937 was the increase in commercial loans, accompanied by a decrease in security holdings. This trend, which reversed depression tendencies, was strong during the first ten months of the year but was arrested by the business recession during the fall. Bank holdings of direct and fully guaranteed obligations of the U.S. Government are estimated to have declined by about 10% during the year, while holdings of other securities fell more than 5%. Commercial, industrial, and agricultural loans are estimated to have increased by about 14%.

Loans to brokers and others on securities fell off sharply in the last three months of the year. The liquidation of security holdings occurred almost entirely in larger correspondent banks, in part to meet the increased commercial and industrial demand for credit, but principally as a consequence of the demand of country banks for funds to meet increased reserve requirements. Security holdings of country banks actually increased during the year.

Demand deposits, including deposits of the U.S. Government, declined by an estimated \$1,500,000,000 during the year. An increase of about \$600,000,000 in time and savings deposits is estimated to have occurred during the period. The activity of deposits, as reflected in debits to individual deposit accounts continued at a level far below that of the 1920's. For activities of the Board of Governors of the Federal Reserve System and the

Treasury in the field of money and credit control during 1937, see FEDERAL RESERVE SYSTEM.

The banks' net earnings for 1937 were probably higher than for 1936. Net profits, however, were probably lower in 1937 than in the preceding year. Interest rates continued at the low levels which have characterized the money market during the past three years. Member banks held more than \$1,000,000,000 of excess reserves at the end of 1937.

Banks continued to benefit from the savings in money costs made possible by elimination of interest payments on demand deposits and reduction of the rates allowed to be paid on time and savings deposits. Income from service charges, commissions, and fees continued to increase. Profits on securities and recoveries on charged-off assets, however, were substantially below the amounts realized in 1936.

From the beginning of deposit insurance to Nov. 30, 1937, 174 insolvent insured banks were placed in receivership or merged with the aid of loans by the Federal Deposit Insurance Corporation. The 270,000 depositors in these banks, having total deposits of \$73,395,000, were protected to the extent of \$69,760,000, or 95% of their claims, by insurance, offset, pledge of security, preferment, or through loans and purchase of assets by the Corporation. All but 621, or less than one-half of 1%, of the depositors in the suspended banks, were fully protected against loss. Of the 174 banks 123, with deposits of \$35,421,000 were placed in receivership and 51, with deposits of \$37,974,000, were merged with other banks with the aid of loans and purchases of assets by the Corporation amounting to \$16,376,000.

The National Association of Supervisors of State Banks was active during 1937. This association provides a clearinghouse for the several State and territorial supervisors of banking and co-ordinates their efforts to work in the interest of the State banking systems. The association's executive committee met in Washington on several occasions to discuss with legislators, the Board of Governors of the Federal Reserve System, and the Federal Deposit Insurance Corporation matters affecting State banks. The committee currently is working toward the enactment of uniform minimum operating standards for all State banks, a step which ultimately will improve the working basis of all classes of banks.

The ability of bank managers as well as their knowledge of banking processes should benefit from 1937's awakened consciousness of the possibilities of research and education. Announcement was made during the year of a banker-sponsored research project into all aspects of the financial structure on a scope not approached since the investigations of the National Monetary Commission 30 years ago.

Research into general and specialized aspects of banking was placed on the agenda of nearly every State association of banks and was given greater prominence than ever before by national professional groups. Supplementing the periodic meetings of State associations there were established in many instances during the past year schools of varying lengths sponsored jointly by the associations, the State departments of banking, and the State universities.

No major Federal legislation affecting banks or banking was enacted during 1937. Early in the year William G. McAdoo, U.S. Senator from California, introduced two bills. One of these would authorize the establishment of branches by a national bank anywhere within the boundaries of the Federal Reserve district which includes the bank's home office. The second bill aimed at limitation of bank stock ownership by holding companies. Wright Patman, representative from Texas, introduced a bill which provided principally for transfer of ownership of the Federal Reserve banks from member institutions to the U.S.

Government. None of these bills was called to a vote in either house of Congress in 1937. (See also FEDERAL LAND BANKS.)

(L. T. C.)

**Great Britain.**—The Bank of England is the central bank of the country, and as such acts as the banker of the Government and the commercial banks. Commercial banking in England and Wales is mainly in the hands of the 11 clearing houses (members of the London Clearing House).

Their names and average position for Nov. 1936 and 1937 are as above, all figures being in millions of pounds.

The first five of the clearing banks, known as the "big five," operate branches all over the country. The next three operate mainly in Lancashire, the next two in London, and the National Bank largely in Ireland. The general tendency during 1937 was for the banks to experience a greater demand for advances, due to the expansion of trade, particularly in the heavy industries.

Since 1932 the policy of the Government, carried out by the Bank of England (*q.v.*), has been to make credit cheap and plentiful. The gold reserves of the Bank of England have greatly increased since that year, and so this expansion of credit could be carried out without any need for heavy purchases of securities by the bank. During the past year the Bank of England, in execution of the Government's policy, has made little change in the size of the credit base. The result is the very small increase in clearing bank cash, shown in the above table. (N. E. C.)

**Canada.**—Under the Canadian Constitution, banking and control over banks are vested solely in the National Government. There are, therefore, no true Provincial banks. The Bank of Canada which obtained its charter in 1934 is now (1938) a national bank as the result of recent amendments assigning a majority of its shares to the Minister of Finance. The bank is empowered to buy and sell securities of the Dominion, the Provinces, the United States and Great Britain, and, to a limited extent, the securities of other British Dominions and France. Short term securities of the Dominion and the Provinces may be re-discounted. It may also buy and sell certain classes of commercial paper and may re-discount them when endorsed by a chartered bank. Short term advances may be made to the Dominion and Provincial Governments and to chartered banks. It may buy and sell gold, silver, nickel and bronze coin, gold and silver bullion and foreign exchange.

The Dominion Government notes have been replaced by notes of the Bank of Canada. The notes of the chartered banks are being gradually replaced by Bank of Canada notes and by 1944 the chartered banks will be allowed to issue their own notes to an amount equal to only 25% of their paid-up capital. It seems probable that, in course of time, even this limited right to issue

notes will be withdrawn. The Bank of Canada must maintain a reserve of gold equal to not less than 25% of its total note and deposit liabilities in Canada. It now holds all the gold reserves in the nation. It acts as a bank for the Government and for the chartered banks; not for the public. The chartered or commercial banks now (1938) number only 10 as compared with 28 in 1867. They are allowed to have branches in any part of Canada and in any other country which permits it. At present (1938) the number of branches in Canada is 3,398; in other countries 145. The chartered banks must maintain with the Bank of Canada a reserve equal at least to 5% of their deposit liabilities. They must make monthly reports to the Government and they are subject to regulation by Government inspectors. (J. C. HE.)

**Australia.**—The Commonwealth Bank is the central bank of the Dominion, but it also does a certain amount of commercial banking. The commercial banks are known as the "trading banks." Both the Commonwealth Bank and the trading banks hold a large part of their cash reserve in sterling in London, and these are known as "London funds." Their size, and so the whole supply of credit in Australia, depends upon Australia's trade balance. During the year to June 1937, there was an increase of about £20 million sterling in London funds, which made credit easier. There is no organized money market in Australia, and the banks lend the bulk of their funds to their customers. The main event in 1937 was the issue of the Australian Banking Commission's report, which made numerous recommendations on the relations between the Government, the Commonwealth Bank, and the trading banks.

Two main points of controversy arose: the proper relation between the Government at Canberra, the Commonwealth Bank, and the trading banks, and the function and ownership of London funds. Both points to some extent merge in the basic question of whether the Commonwealth Bank is to be partly a commercial bank, or entirely a central bank.

**India.**—The structure of Indian banking is still very complex, but during the past few years it has been simplified and co-ordinated in certain important respects. The principal change was the foundation of the Reserve Bank of India in 1935. This bank performs for India all the normal functions of a central bank, and is also bound to buy and sell sterling on demand at a pegged rate of 1s. 6d. per rupee. Thus it also acts as the supplier of foreign exchange.

India's foreign trade is largely financed by the 17 exchange banks. The internal banking structure is very complex. There are 105 joint-stock banks with paid-up capital and reserves of at least one lakh (£7,500) and those with paid-up capital and reserves of at least 5 lakhs (£37,500) must keep balances with the

Reserve Bank. There is a whole system of co-operative banks. Finally, as intermediaries between the banking system and the peasant in need of credit, there are numerous native bankers, such as the local mahajan or bania, and the shroff who discounts for the mahajan. The chain then leads on via the co-operative, indigenous, or joint-stock bank to the Reserve Bank.

**South Africa.**—The banking system consists of the Reserve Bank and a limited number of branch-banking systems. One such system (Barclays D.C.O.) also operates in other parts of the Empire. Up to the end of 1932, when South Africa abandoned the gold standard and linked on to sterling, credit conditions were very difficult. Since then, however, South Africa has passed through a period of great prosperity. This was due, first to the rise in the price of gold, due to the depreciation of the South African pound, and second, to general recovery at home and abroad. Comparing 1932 and 1937, deposits have risen from £51.3 to £59.7 millions, and discounts and advances from £21.9 to £28.3 millions.

**Europe.**—Banking in many important European countries differs from British banking in several respects. First, there is not always a clear-cut division between central banking and commercial banking. In France, for example, the Banque de France (*q.v.*) is both a central bank and a commercial bank. Next, with the exception of Holland, there is no well developed money market as exists in London. Another important point of distinction is that in many countries there are various classes of banks. Thus France has her *banques d'affaires* as well as her ordinary commercial banks of deposit, and the *banques d'affaires* make long-term investments or participations in industry. Germany has systems of commercial banks, savings banks, *girozentralen* (which now act as bankers to the savings banks), and mortgage banks. Many other countries have mortgage banks, whose primary function is to finance land purchases, and in many countries banks of all kinds are readier to engage these resources in industry than is the custom of British banks. Most countries have branch-banking systems, but again there are exceptions, as in the case of the Cantonal banks in Switzerland.

Thus, the whole banking system of the Continent is much less definite in character than in England, and in the absence of a money market, is not so susceptible to control. Generally during 1937 the tendency was in the direction of greater liquidity. Thus, Holland and Switzerland, and to a lesser degree France, benefited from the devaluations of Sept. 1936. Credit conditions in Germany have now become extremely liquid, owing to the recovery of 1932 onwards, and the methods of financing it by means of short-term borrowing. Scandinavia has been prosperous, and this again has meant liquidity. On the other hand, banking on the Continent is not only in the hands of a few large, well-defined institutions. There are a host of small houses, who can barely claim to be called banks, and many of these engage in exchange speculation.

(N. E. C.)

**Bank of England.** The recent structure of the Bank of England dates from 1928 when the Bank of England and the currency note issues were amalgamated under the control of the bank. Subsequent history includes the suspension of the gold standard in 1931 and the establishment of the Exchange Equalization Account in 1932. Some of its 1937 functions are:

(a) It is the custodian of the nation's gold reserve. Since 1932, part of this gold is held by the Exchange Equalization Account, but the account is operated by the bank under the general direction of the Government.

(b) It has the sole right of note issue in England and Wales. Its notes are legal tender and not convertible into gold.

(c) It is the Government's banker and adviser upon monetary matters. It is also responsible for the administration of the national debt.

(d) It is the "bankers' bank"; that is, it holds part of the cash reserves of the joint-stock and other commercial banks.

(e) It is the controller of the supply and cost of credit. By fixing bank-rate it roughly determines the general level of short-term interest rates. By buying or selling securities it can expand or contract commercial bank cash and the general supply of credit. It is the lender of last resort—that is, it will always lend to approved borrowers, at its own price, when other sources of credit fail.

(f) It is an unofficial but effective link between the Government and the city. It is also in contact with foreign central banks and the Bank for International Settlements.

During 1937, the way in which it exercised most of these functions can be summarized by saying that it maintained an ample supply of credit and stable monetary conditions in both internal and external relations. At the end of 1936, it bought £65,000,000 of gold from the Exchange Equalization Account, simultaneously reducing the fiduciary note issue by £60,000,000. This relieved the account of surplus gold without expanding overmuch the internal credit base. During the gold scare of the early summer, the bank bought gold both for the Exchange Equalization Account and also for itself. The Christmas expansion in the note circulation was prevented in two ways from restricting the supply of credit. First, the fiduciary note issue was temporarily enlarged by £20,000,000, so as to provide the bank itself with the extra Christmas currency. Next, as notes were drawn by the public out of the joint-stock banks, the bank acquired additional Government securities which always had the effect of replenishing the joint-stock banks' cash.

The effect of some of these operations is illustrated in the following table:

Bank of England  
(£ millions)

	Dec. 16	Jan. 13	Apr. 7	June 23	Nov. 10	Nov. 24	Dec. 22
	1936	1937	1937	1937	1937	1937	1937
Gold . . . . .	313.6	313.7	313.7	326.4	326.4	326.4	326.4
Fiduciary Note Issue	200.0	200.0	200.0	200.0	200.0	220.0	220.0
Note Circulation . .	467.7	455.0	469.9	483.7	485.6	480.4	509.3
Reserve . . . . .	46.6	59.0	44.6	43.6	42.4	67.5	38.0
Government Securities*	89.1	83.2	101.1	98.0	103.9	76.2	96.5
Bankers' Deposits . .	96.2	106.7	94.8	95.0	90.9	83.6	98.2

\*In banking department.

A comparison of the returns for April 7 and June 23 shows the bank's gold purchases during the summer gold scare. The returns for Nov. 10 and 24 show the reinforcement of the reserve from the increase in the fiduciary note issue—effected by the transfer of £20,000,000 of Government securities from the banking department to the issue department. The return for Dec. 22 shows the Christmas expansion in the note circulation, and how the consequent decline in the reserve was offset by fresh acquisitions of Government securities. The result was that bankers' deposits were able to gain the full benefit of the Dec. 1 war loan dividend payment, and so rose, and did not shrink during those four weeks from Nov. 24 to Dec. 22.

(N. E. C.)

**Bank of France.** The Banque de France is the central bank of France, but it also does a fair amount of commercial banking business through its branches all over the country. It was founded by Napoleon in 1800, and up to July 1936 was governed by a governor and two vice-governors, nominated by the finance ministry, and 15 regents appointed by

the shareholders. Only the 200 largest shareholders had the right to attend the annual meeting.

In July 1936 an act was passed altering the constitution of the Banque de France. The regents were replaced by a board of 20 directors (together with governor and vice-governor). Ten directors are civil servants; five represent industry, trade, agriculture, labour, and the consumers' co-operatives; the rest represent banking (two representatives), the staff of the Banque de France, "small traders," and the national economic council. Including the governors, 13 out of the 23 directors are civil servants, and so the Government now has control over the Bank.

The position of the bank's loans to the Government was also regularized at that time, and the Government took additional borrowing powers. In place of frs. 14,000 millions of rediscounted treasury bills held by the bank in June 1936, the bank had outstanding in Nov. 1937 frs. 27,000 millions of provisional advances to the Government.

The gold held by the bank was revalued in Oct. 1936, and again in July 1937, in accordance with the two devaluations of the franc. The profit on the earlier revaluation was used mainly to constitute the French Exchange Fund, an equivalent quantity of gold being withdrawn from the bank for that purpose. The profit on the later revaluation was used to establish a special fund for the support of the *Rentes* market, but no gold was then taken from the bank. Between June 1936 and Nov. 1937, the bank's gold stock increased in value from frs. 53,953 millions to frs. 58,932 millions. The note circulation rose from frs. 84,804 millions to frs. 90,948 millions and private deposits from frs. 6,180 millions to frs. 17,860 millions. These latter increases were mainly due to the new Government borrowing.

(N. E. C.)

Bankruptcy.

In the United States the present decade has been no exception to the rule that bankruptcy laws are the products of periods of financial depression. The multitude of recent statutes in this field are, however, noteworthy in their divergence from traditional objectives of bankruptcy. In none of these are the forms of relief limited to the equitable distribution of the debtor's assets among his creditors and his consequent discharge from his obligations. Since 1933 "debtor relief" has taken on wholly new aspects, both as to the kind of debtors who may avail themselves of the benefits of bankruptcy, and as to the nature of the relief. A period of intensive legislative activity was climaxed in 1937 by the introduction of a bill for the comprehensive revision of the entire Bankruptcy Act (the so-called Chandler Bill, H.R. 8046, 75th Congress, 1st session).

The variety of persons for whose benefit bankruptcy legislation has been enacted since 1933 ranges from farmers to railroads. The latter, hitherto outside the Bankruptcy Act, may now be re-organized under Section 77, enacted in 1933 (47 Stat. 1474) and revised in 1935 (49 Stat. 911). Similar privileges were extended to ordinary business, industrial and utility corporations by Section 77B, enacted in 1934 (48 Stat. 912). The urban mortgagor, without undergoing ordinary bankruptcy, may seek relief in the form of compositions or extensions under Section 74, enacted in 1933 (47 Stat. 1467). In the same year the farmer was also given these privileges by Section 75 (47 Stat. 1470); and under the amendments to that section in 1934 (48 Stat. 1289) and 1935 (49 Stat. 943), may in addition avail himself of a limited moratorium on the payment of mortgage obligations. Section 80 of the act, enacted in 1934 (48 Stat. 798), and re-enacted in 1937 (50 Stat. 654-655), permits such local taxing agencies as municipal corporations, and drainage, irrigation and levee districts, to effect a settlement of their defaulted obligations with the aid of the Bankruptcy Act.

\* The earlier of these two statutes was held unconstitutional by

a divided Supreme Court in *Ashton v. Cameron County Water Improvement District*, 298 U.S. 513 (1936). It is only with respect to these taxing agencies, however, that doubts still linger over whether all of these debtors are properly at home within the confines of the Bankruptcy Act.

The element common to all of these statutes is their resort, at least in part, to the device of composition. Composition may be a settlement of debts by a part payment, or involve an extension of time for payment, or it may be both. Its characteristic feature lies in the binding sanction which the Bankruptcy Act gives to such agreements; if a majority or more of the creditors agree to an offer of composition submitted by the debtor, dissenting minorities are compelled to accept the same treatment. Compositions have been possible under Section 12 of the Bankruptcy Act since 1898 (30 Stat. 549), but have been limited to the treatment of unsecured debts. Until the advent of these statutes bankruptcy laws left unimpaired the lien of secured creditors. Under Section 74 such liens may be impaired by extension of the time for payment. And their more serious impairment as to amount is possible and valid under the other of these statutes, when accomplished by a composition. An even more radical innovation in the treatment of secured debts is contained in Section 75 (s) as re-enacted in 1935 (49 Stat. 943).

These provisions do not turn on the consent of creditors. In essence they grant to the insolvent farmer a three-year moratorium on his defaulted mortgage, on payment of a reasonable rental. These measures were held constitutional in the outstanding bankruptcy decision of 1937, *Wright v. Vinton Branch of Mountain Trust Bank*, 300 U.S. 440.

These expanding conceptions of the bankruptcy power will perhaps leave their major impress in the field of corporate reorganizations. In this connection the Chandler Bill, previously mentioned, undertakes the extensive revision of Section 77B, with particular emphasis upon remedying its deficiencies in respect to the protection of investors. In the field of ordinary bankruptcies, the bill would clarify definitions, jurisdiction and practice, and eliminate present delays and expense in administration. The fundamentals of the present act are not disturbed. (See also RAILROADS.)

(W. O. D.)

**Great Britain.**—In Great Britain there were no statutory changes in the Bankruptcy Acts 1914 and 1926 or the Deeds of Arrangement Act during 1937.

The failures in 1937 showed a small improvement over 1936, but it does not seem possible that we shall ever see the failures reduced to negligible figures. There appears to be a definite point around which the failures fluctuate. There has been a small yearly improvement since 1927 with the exception of a rather sharp set back in 1931 and 1932 when the total failures rose to over 8,000.

The total failures in the United Kingdom and Ireland during 1937 totalled just short of 5,600, an improvement of 1.02% over 1936. Of this total 2,084 were under Deeds of Arrangement. The chief offenders in their order were as follows:

Building . . . . .	588
Groceries and Provisions . . . . .	482
Farmers . . . . .	315
Drapers and Hosiery . . . . .	254
Plumbing, Painting and Gasfitting . . . . .	237
Private Persons . . . . .	208

The wholesale trades accounted for 7.85% and were predominantly resident in the London district. This was an increase over 1936 of 5.04%. The heaviest county outside of the London area was Lancashire for failures in the wholesale section, one of the effects of foreign political troubles.

There were several businesses in which there were no failures, the principal ones being bankers, brewers, music publishers and shipwrights.

To summarize and publish figures in terms of money values would be to give misleading figures as to loss of investment and circulation of business credit because we should really take into consideration the realization at sales and dividend to creditors declared very often years after the failure.

One redeeming feature of 1937 was the absence of any nation-shaking disaster.

**Baptist Church.** The Baptists of America, totalling 10,119,379 members, are divided into two main bodies; the first, three groups with 9,608,689 members; the second, fifteen miscellaneous groups with 510,690 members. In the first division the Southern Convention has 24,671 churches and 4,482,315 members; the National (coloured) 22,000 churches and 3,650,044 members; the Northern 7,616 churches and 1,476,330 members. According to latest statistics, the Southern received 92,898 new members during the year; the National 85,000; the Northern 17,519.

The Southern and Northern reported gains in church contributions and missionary benevolences—to the amount of \$2,300,120 and \$795,577 respectively.

Each Convention took action respecting certain social problems. Through its Social Service Commission the Southern reaffirmed "our unchanging condemnation of mob violence in all forms," declaring, "we shall not be satisfied or content until lynching shall cease and mob violence shall be completely banished." Resolutions denounced war and commended the League of Nations as "a very great force and influence for steadying the international situation and averting war." "Child marriages" were deplored and "the laxity and inadequacy of existing statutes in the several States for the regulation of marriage."

The Northern Convention pledged itself "to work for a constitutional amendment providing that Congress shall not have power to declare war involving the sending of our Army to foreign soil . . . until . . . authorized by vote of the American people taken in a national referendum." In industrial affairs, it resolved, "that we continually sensitize our consciences to the wrongs and injustices inherent in our social and economic life . . . affirming our conviction that Christ's principle of the Golden Rule and his concern for the building of the Kingdom of God . . . lay upon us . . . the compulsion to work for a living minimum wage . . . to be set by law." Each Convention appointed a Committee on Public Relations which were to co-operate "when principles held alike by Northern and Southern Baptists are in any way endangered." Perhaps the most significant action of these three Conventions was their decisions to participate in the World Conferences at Oxford and Edinburgh, July 12-16 and Aug. 3-18, 1937, respectively. At the Lausanne Conference in 1927 these Conventions declined to be represented. At each of the 1937 Conferences the Southern Convention had two duly appointed delegates. The Northern had eight official delegates and seven associates at Oxford, five delegates with three alternatives at Edinburgh. The National had one delegate at Oxford and one visitor at Edinburgh. (R. E. E. H.)

**Great Britain.**—The Baptist Union of Great Britain and Ireland has, through its affiliated churches, a membership of 293,198, a decrease of about 3,000 on the year 1936. Full statistics of the Baptist Church in the British Isles for 1937 show that 3,224 churches, with seating accommodation for 1,439,687 people, have a membership of 392,535 and 401,906 Sunday school pupils. A year previously the membership was 396,531 and Sunday school pupils numbered 418,483. The Baptist World Alliance, a federation of national unions, has some 12,000,000 communicant mem-

bers in 70 countries the world over. The Strict and Particular Baptists have in England and Wales about 20,000 members.

The president of the Baptist Union 1937-38, is Mr. H. L. Taylor (of Bristol), and the Annual Assembly of 1937 took place at Manchester in April. It was reported that the Baptist Forward Movement, founded for the purpose of raising £1,000,000, was steadily making ground in an effort for church extension, it being claimed that since the World War 8,000,000 people have settled in the new housing areas in Great Britain. The international work of the young people's department is being developed, and correspondence is freely exchanged between home Sunday school members and those in other lands. Young People's Fellowships have shown a marked increase.

**Baqir Sidqi Pasha** (1890-1937), Iraqi soldier and statesman; born at Askeri, near Kirkuk, in Kurdistan. At the age of 18 he was a staff officer in the Turkish Army, and during the War he served in the Dardanelles campaign. In 1931 he became a colonel in the Iraqi Army, with command of the northern zone; and in the following year attended courses in England at the Staff college, Camberley. In 1933 King Feisal dismissed Baqir Sidqi from his post in consequence of his responsibility for the massacre of unarmed Assyrians; but he was shortly afterwards restored and made pasha. In Nov. 1936 he brought off a successful military *coup d'état*, was appointed permanent chief of the Iraqi General Staff, and became military dictator of his country. Together with his colleague, Major Muhammad Ali Jawad, he was assassinated on the Mosul aerodrome Aug. 12, 1937, by an Iraqi soldier, reported to be a relative of Jafar Pasha, defence minister in the cabinet overthrown by the 1936 coup.

**Bar Association, American:** see AMERICAN BAR ASSOCIATION.

**Barbados,** most easterly of the British West Indian colonies; language, English; capital, Bridgetown (pop. 54,234); governor, Sir Mark A. Young. The area is 166 sq.mi.; population (official estimate, 1936), 188,294 with 71% negro, 22% mixed, and 7% white. Government is administered by an appointed governor and council, and a representative assembly. Barbados has 24mi. of railways and ample external steamer communication. Imports in 1936 totalled £2,004,484, chiefly from Great Britain (42.7%), Canada (14.1%), and the United States (10.4%); exports, chiefly sugar (65%), were £1,493,335, largely to Canada (56.2%) and Great Britain (32.2%). Sugar is the chief crop, with cotton production on the increase. The monetary unit is the pound sterling. Revenues for the year 1936-37 were £483,143 and expenditures, £460,870. Barbados has 126 elementary schools (enrolment 26,117) and several secondary schools. Codrington college, near Bridgetown, has high standing.

**Barbour, Clarence Augustus** (1867-1937), American clergyman who had served since 1929 as tenth president of Brown university. Born in Hartford, Conn., April 21, 1867, he was graduated from Brown in 1888 and from the Rochester Theological seminary three years later. His first charge was as pastor of the Lake Avenue Church, Rochester, N.Y. From 1909-15 he was associate secretary for the International Committee of Y.M.C.A.'s of North America. Called to the Rochester Theological seminary as professor of homiletics in 1915, Dr. Barbour acted as its administrator until 1928. His administration of Brown university was marked by emphasis on high scholastic standards and by enlarged opportunities for study. Among his writings were *The Bible in the World of Today* (1911) and *Making Religion Efficient* (1912). He died in Providence, R.I., Jan. 16, 1937.

**Barcelona**, a city and seaport of Spain, capital of a province of the same name, and former capital of Catalonia, is situated on the north-east coast, about 73mi. S. of the French frontier and 430mi. by rail E.N.E. of Madrid; pop. (est. Dec. 31, 1934): 1,148,100.

Barcelona's history during 1937 was dominated by the civil war, the city having been, since the outbreak of war (July 18, 1936), a stronghold and rallying-point of the Government forces, and, since Nov. 1, 1937, the temporary seat of the Government, this having moved from Valencia for economic and strategic reasons. In the early months of the war, it was the scene of more than one anarchist "terror," in which churches were rifled and priests slain, and early in Feb. 1937, a number of spies, including Italians, were captured. On April 4, after a week's crisis, the Catalonian president formed a new cabinet; but on May 5, street fighting having taken place with over 100 killed, this was replaced by a directorate of four. The town suffered much from Insurgent air-raids, but no rebel force ever came near it on land.

**Barium.** Although various barium minerals, chiefly the sulphate or carbonate, are mined to the extent of some 750,000 tons annually, and used in industry, it is only within the past few years that barium metal has become an article of commerce. The metal has high electron-emitting properties, and is used as a constituent of alloys for making spark plug terminals and similar equipment, and as a "getter" in radio tubes, for the purpose of removing the last traces of oxygen. The metal is now available at about \$5 per pound, or less, depending on quantity.

**Barley.** World production in 1937 was estimated by the International Institute of Agriculture at 1,117,099,000bu. as against 1,067,551,000bu. in 1936, excluding Russia. The 1937 crop in Europe was 530,348,000bu., compared to 577,373,000bu. in 1936. In Asia the Institute's estimates are 187,702,000bu. for 1937 and 166,403,000bu. for 1936; in Africa, 83,000,000bu. in 1937 and 114,401,000bu. in 1936, while for the last two harvests in Argentina the figures are 29,855,000 and 28,530,000 bushels. In Canada the 1937 crop was approximately 87,781,000bu. and 71,922,000bu. in 1936. In the United States the Department of Agriculture estimated the 1937 production at 219,635,000bu., which is 49 per cent larger than the short crop of 147,475,000bu. in 1936, and 22 per cent below the five-year average (1928-32) of 281,237,000 bushels. No figures for Russia are available, except that the average annual production from 1931 to 1935 was 303,607,000 in the U.S.S.R.

The barley crop of the United Kingdom in 1937 was the smallest on record, totalling about 30,500,000bu., or 3,700,000bu. under the production of 1936. In contrast to this smaller production of malting barley, beer consumption in England increased 6.75 per cent over 1936 in the five spring and summer months of April to August 1937, which was the fifth consecutive year beer consumption has increased in England. In Germany the 1937 crop was 162,886,000 bushels. That of 1936 was 156,122,000 bushels. Turkey's barley yield was 104,949,000bu. in 1937 and 105,810,000bu. in 1936. The crop in Poland in 1937 was 58,791,000bu. and 64,367,000bu. in 1936. (See also CEREALS.)

(S. O. R.)

**Barrie, Sir James Matthew** (1860-1937), Scottish playwright and author, who created the character Peter Pan. A detailed discussion of his life and works appears in the *Encyclopaedia Britannica*, vol. 3, p. 140. He had been rector of St. Andrews University, chancellor of Edinburgh, president of the Society of Authors, and a member of the American Academy of Arts and Letters. His most

recent play, *The Boy David*, was first produced in London in 1936. His death occurred in London, June 19, 1937.

**Baseball.** The climax in baseball in the year 1937 came in the fall in the world's series, the sport's most important annual fixture. The New York Yankees of the American League and the New York Giants of the National League met for the world title. The Yankees emerged victorious, scoring four games to one, thus winning their second consecutive world series and their sixth in the history of the club. The series came close

CARL HUBBELL, ace pitcher of the New York Giants, demonstrates his favourite hold

to being a clean sweep for the Yanks. They won both first and second games by a score of 8-1 in the Yankee Stadium. The third game was played at the Polo Grounds; but even on their home stamping grounds the Giants still seemed unable to stem the rushing tide of Yankee victories. The Yanks won the third game, 5-1. Then, the Giants recovered sufficiently to extend the series another game by taking the fourth contest, 7-3, but yielded the championship the next day, 4-2.

The Yankees, managed by Joseph V. McCarthy and owned by Colonel Jacob Ruppert, won the pennant in the American League with comparative ease, enjoying a margin of 13 games over the Detroit Tigers, their nearest pursuer. In third place were the Chicago White Sox, then the teams of Cleveland, Boston, Washington, Philadelphia and St. Louis, in that order. Not so easy was the Giant championship of the National League. In fact, the race down the homestretch was one of the most heated in years. The Giants, piloted by William Terry and owned by Horace Stoneham, drew ahead in the closing stages, snatching the pennant from the Chicago Cubs, who finished in second place, three games behind the leader. The other clubs in the National League finished in this order: Pittsburgh, St. Louis, Boston, Brooklyn, Philadelphia and Cincinnati. For the Yankees, it was their ninth league pennant; the third under McCarthy's management; the ninth under the ownership of Colonel Ruppert, and it tied them with the Philadelphia Athletics, the only other American League team ever to win the escutcheon nine times.

By winning the National League pennant, the Giants scored their second successive triumph, brought home the flag for Manager Terry the third time in his five complete campaigns as pilot, and made possible an all-New York series for the fifth time in the history of major league baseball.

**Comparative Statistics.**—The effectiveness of American League pitching and batting was evident throughout the season. At the fifth annual All-Star game in Washington, D.C., a composite team of American League players defeated a composite National League nine by a score of 8-3. The game, for which President Roosevelt threw out the first ball, attracted 32,000 spectators and yielded proceeds of \$28,475 for the fund maintained for indigent baseball players. Another example of the American League's batting strength was apparent in the number of home runs hit during the regular season. American League batters accounted for 806 home runs while the National League hitters drove 623. The individual leaders in home runs were Joseph DiMaggio of the Yankees with 46 and Melvin Ott of the Giants with 31.

The best all-around batting average for the season was made by a National League player, however, Joseph Medwick of St. Louis Cardinals finished with a percentage of .374. In the American League, the batting leader was Charles Gehringer of the Detroit Tigers, who batted .371. At the finish their standings were as follows:

	Games	At Bat	Runs	Hits	Percentage
Medwick .....	156	633	111	237	.374
Gehringer .....	144	564	133	209	.371

Carl Hubbell of the New York Giants had the finest pitching record in the National League, while John Allen of Cleveland led the American League hurlers. Their comparative standings for the season follow, in games pitched, games credited as won, and games charged as lost:

	Games	Won	Lost	Percentage
Hubbell .....	39	22	8	.733
Allen .....	24	15	1	.938

Only one major league pitcher was able to achieve a no-hit, no-run game during 1937. Bill Dietrich of the Chicago American League team accomplished this feat in a game with the St. Louis Browns in Chicago on June 1. He allowed only two bases on balls. One batter who faced him reached first base on an error. Organized baseball enjoyed in 1937 one of its most financially successful seasons. Throughout the regular major league campaign, a total of 9,500,000 persons saw the 16 major league clubs in action, bringing in a return of approximately \$14,250,000. Both the New York Yankees and the Detroit Tigers topped the million mark in total attendance at regularly scheduled league contests. The world series, lasting for five games, attracted a total of 238,142 paid admissions which brought the gross receipts at the gate to \$985,994, one of the highest figures for a five-game series and one of the best financial returns for any world series regardless of the number of games. The world series money was apportioned as follows: Commissioner's share, \$147,899.10; players' share (figured only on the basis of returns from the first four games), \$417,305.97; clubs' share, \$210,394.46; leagues' share \$210,394.46. Major league salaries continued high, although not quite at the peak reached by the stars of the period between 1923-29. Lou Gehrig of the Yankees received \$35,000 for the season, one of the biggest pay-checks in the sport for a player or club manager.

**The Minor Leagues.**—Minor league baseball also brought to a conclusion a highly successful season by its own little world series. In this minor league baseball classic, the Newark (N.J.) Bears of the International League met the Columbus (Ohio) Red Birds of the American Association. The Bears won the series, four games to three. It was a startling upset as the Columbus nine had won three of the series games before Newark had won one. Then the latter team clicked off four victories in a row. Newark reached the little world series by defeating Baltimore (Md.) in the International League play-offs. Columbus qualified to represent the American Association by winning the race in that circuit by the narrowest margin in its 36-year history. Columbus finished with a one-game margin lead over Toledo. Minneapolis was third and Milwaukee, fourth.

In other minor league competition, Fort Worth of the Texas League vanquished Oklahoma City to win the Texas League pennant. Little Rock of Little Rock, Ark., won the Southern Association flag. Then these two teams—Fort Worth and Little Rock—met to decide the Dixie Series Championship, which was won by Fort Worth. The San Diego (Calif.) Padres captured the championship of the Pacific Coast League, finishing third in the regular season, then winning the play-offs. The Elmira (N.Y.) Pioneers excelled in the New York-Pennsylvania League.

**College Baseball.**—The popularity of baseball extended to the

campuses of leading American colleges and the sport enjoyed a colourful season. Yale university won the Eastern Intercollegiate Baseball League title for the first time in five years. The Elis defeated Harvard, 7-6, in a 15-inning encounter at New Haven Conn. Harvard was runner-up in the league, Dartmouth was in third place and the University of Pennsylvania, fourth. The Big Ten Conference, embracing college teams in the Middle West, saw a heated race in this favourite sport. The team from the University of Illinois won the Conference baseball championship. With the exception of these two prominently organized college baseball circuits, other universities maintain baseball teams playing full schedules with other colleges but not participating in any established league. The baseball teams of Fordham, Duke, Long Island university, Holy Cross, Lehigh, Lafayette and countless other American colleges reported successful campaigns in 1937.

It is impossible to estimate the number of teams made up of boys and young men who play regularly on open fields throughout the United States. In fact, from these very improvised diamonds come many of the major league stars of future years. Probably the greatest sustained growth of baseball during the past year was noted on two divergent fronts: the sandlots of the United States, and the athletic fields of Japan. In Japan, the popularity of baseball has continued apace and the sport may soon become the national pastime. One reason is the series of barn-storming trips made by many American major league stars during numerous winter seasons. Exhibition games throughout Japan by these players have served to familiarize the Japanese people with the game. In the last year a few American college teams also have visited Japan for games there with the teams of Japanese universities. (J. P. D.)

**Basic English:** see UNIVERSAL LANGUAGE.

**Basketball,** originated in 1891, is played in 58 countries and is growing in popularity. Until 1937 the ball was put in play at the beginning of each period and after each goal was made by tossing it up between two opposing players thus giving each team an equal opportunity of obtaining the ball. The new 1937 rules read:—"After a goal from the field, any player of the team scored upon shall put the ball in play from any point out of bounds at the end of the court where the goal was made." Other changes were: blocking was differentiated from screening—in blocking there must be personal contact; the centre line is to be treated as any boundary line in determining in which court a player is standing; and in high school basketball the overtime periods are limited to two, and five timeouts are allowed each team in any game. Changes in women's rules allow a player to take the ball away from an opponent and permit a substitute to communicate information immediately. In 1937 there were 10,000,000 spectators (Grantland Rice estimate) and 60,000 competitive teams (Ferris estimate) in the United States. The college champions were:

**Basutoland.** Basutoland is entirely surrounded by territory of Union Provinces, Orange Free State, Natal, and the Cape. Area, 11,716 sq.mi., lying between 28°35' and

30°40' S. lat., and 27° and 29°30' E. long. Altitude 5,000 to 11,000 feet. Basutoland is a British Colony, administered, under the South African High Commissioner, Sir William Henry Clark, K.C.S.I., K.C.M.G., by a resident commissioner. Chiefs administer justice in their own courts. Capital, Maseru.

**Population** (census 1936): Bantu, 660,650; Europeans, 1,434; coloured, 1,600. Elementary education is available to all, and over 70% of school age are enrolled: there are one Government and ten mission institutions for higher grades.

**History.**—A loan of £160,233 was received in 1935 from the Colonial Development Fund for anti-erosion work, and a further loan in 1936 for an ecological survey and grassland experiments.

**Trade and Communications.**—The territory is linked with the railway system of South Africa by a short branch line to Maseru. Since 1936, regular road transport service by South African railways has been established. Chief exports are wheat, wool, and mohair; total exports (1936), £302,193; imports, £712,125.

The deficit between exports and imports is filled by wages earned on the Rand mines, on which all male Basutos spend some time. At the close of 1936, 45,399 were so employed.

**Bathysphere:** see MARINE BIOLOGY.

**Battleships:** see LONDON NAVAL CONFERENCES; NAVIES OF THE WORLD; REARMAMENT.

**Bauhaus, The New.** This American School of Design was opened October 18, 1937 in the family home of Marshall Field, 1905 Prairie Avenue, Chicago, which was presented to the Association of Arts and Industries by Marshall Field, III. The school was organized and is operated by the Association of Arts and Industries, a non-profit organization founded in 1922 and composed of manufacturers, public spirited people and designers. The New Bauhaus continues and expands the plan of the former Bauhaus founded in Weimar in 1919 by Dr. Walter Gropius. In the present school Dr. Gropius' method of close co-operation between art, science, and technique is the basic plan. Dr. Gropius, now professor of Architecture at Harvard university, is the advisor of the New Bauhaus. L. Moholy-Nagy, one of Dr. Gropius' closest collaborators at the Bauhaus in Dessau is the director of the school. Professor Moholy is not only a painter of international fame but has worked with industrial firms in glass, metal, textiles and wood and is equally skilled in photography and films. Guest lecturers from the University of Chicago in charge of the sciences are: Professors Ralph W. Gerard, Carl Eckart and Charles W. Morris, and the following are members of the faculty: Lecturer, Basic Design Workshop: L. Moholy-Nagy; Head of Basic Design Workshop: Hin Bredendieck; Technician Basic Design Workshop: A. Schlitz; Modelling: Alexander Archipenko; Music and Building Musical Instruments: David Dushkin; Drawing and Light Studio: George Kepes; Photography: Henry Holmes Smith. The school opened with 35 students from States all over the country. The second semester enrolled 20 more, again from distances and a night class opened with the second semester with an enrolment of 20. The officers of the Association of Arts and Industries are: President E. H. Powell, Vice-President Glenn G. Hayes, Treasurer Frank Milhening, Secretary and Executive Director Norma K. Stahle.

(L. M.-N.)

**Bauxite.** An increasing demand for aluminium has stimulated the production of bauxite in a number of countries that were formerly only minor producers, particularly Yugoslavia, Hungary, Italy and the Soviet Union, but has not yet materially

*World Production of Bauxite*

affected the output of the other large producers; the increased output of the last two is largely for home consumption, but that of the first two goes largely to Germany. Other uses are still below the 1929 level of consumption. On the average, about 60% of the output is used for metal, while the remainder goes into chemicals, abrasives, cement and refractories. (G. A. Ro.)

**Baylis, Lilian Mary** (1874-1937), British theatre manager; born in London, May 9. In early life she taught the violin and other stringed instruments in South Africa, but, after returning to England in 1898, joined her aunt in the management of the Old Vic theatre in South-east London. She became sole manager of this theatre in 1912, and won herself lasting fame by staging all Shakespeare's plays and many other classics, as well as opera in English, at prices within the means of the humblest theatre-goer. In 1931 she took over the management of the re-opened Sadler's Wells theatre in addition, and made of this a North London counterpart of the Old Vic. She was made a Companion of Honour in 1929. She died in London, Nov. 25, 1937.

**Beans, Dry.** Higher yields per acre and a larger harvested area of 1,794,000 acres produced a crop of 14,300,000 bags, or 1,430,000,000 pounds, of edible dry beans in the United States. Together with an estimated carryover of 850,000 bags from the 1936 crop the total 1937-38 domestic supply of dry beans is 24 per cent larger than a year ago and 14 per cent above the five-year average. In 1936 the United States imported 587,000 bags. The 1937 acreage was 15 per cent more than that of 1936. (S. O. R.)

**Bechuanaland Protectorate** is bounded S. and E. by the Union of South Africa, N.E. by Southern Rhodesia, N. by Zambesi and Chobe river, and W. by South-west Africa. Area estimated at 275,000 sq.mi.; mean altitude 3,300 feet. Bechuanaland is administered by a resident commissioner, under the high commissioner for South Africa, Sir W. H. Clark, K.C.S.I., K.C.M.G. The chiefs retain their status and hold tribal courts: headquarters of administration is at Mafeking. Population (census 1936): Africans, male 129,259, female 130,805; Europeans, male 1,064, female 835. A portion of each unit of tax goes into a Native Fund for social services, from which £11,717 was voted in 1936 for education. The tribes are Christians. Communications are primitive. The South African railways line to Southern Rhodesia passes along the eastern border, but about 50mi. west of the railway the tracks become unsuitable for motor traffic. Agricultural production is limited by lack of rainfall. Chief exports, 1936: hides and skins. Value of cattle £105,072, sheep and goats £9,452, butter £11,457, hides and skins £23,777, kaffir corn £21,852. Value of gold mining output, 1936, £117,061. Imports (1936) were £363,270, and exports £347,858. (W. M. MA.)

**Beef:** see MEAT.

## Bee-keeping.

Except in British Columbia, California, Texas, Louisiana, Kentucky, Tennessee and Arkansas, the North American honey crop was below normal and under the 1936 production by percentages ranging from 30 to 60 in different States and Provinces. There are no reliable figures as to total production since so much of the crop is sold and consumed locally. Annual per capita consumption of honey is estimated at about 16 ounces in the United States and four ounces in Great Britain. There are between 600,000 and 800,000 bee-keepers in the United States. A revival of bee-keeping during the last ten years in Great Britain has resulted in doubling honey production which is now about 40,000 hundredweights annually. For some years, and especially since the more general use of motor trucks, many American bee-keepers have taken their apiaries to Florida and other Southern States during the winter months. The profitability of this practice is now disputed, except as to its recreational value to the bee-keeper. Investigations by the *American Bee Journal* indicated that in many sections of Canada and the United States colonies entered the winter months with inadequate food supplies. (S. O. R.)

**Beer:** see BREWING AND BEER.

**Beet Sugar:** see SUGAR: *Beet Sugar*.

## Belgian Congo,

a Belgian colony in central Africa. Included with the Belgian Congo are, as a mandate, the former German East-African districts of Ruanda and Urundi. Ruler, the king of the Belgians represented by a governor-general (Pierre Ryckmans, appointed 1934). Area: Congo 927,000 sq. mi.; mandated territory 20,500 square miles. Population: Congo, Europeans 18,683, natives about 11,000,000; mandate, Europeans c. 890, natives c. 3,385,000. Leading towns: Léopoldville, the capital (4,447), Elizabethville (5,841). There are 14 schools for Europeans, and 11 State schools and 4,217 subsidized schools for Africans. In August 1937 discussions took place at Léopoldville between the Belgian authorities and the defence minister of the Union of South Africa regarding a projected air service between Johannesburg, Léopoldville, and Kisumu. An increase in the Congo army, and the creation of a Colonial air force, were under discussion in Belgium at the end of 1937.

The chief product is copper. Production in 1935 was 107,682 tons. Other minerals are radium, and diamonds (3,812,023 carats in 1935). There are European coffee and cocoa plantations, and native cotton plantations which produced (1935) 76,333 tons. Exports in 1935 totalled frs. 1,202,943,444, and imports frs. 613,573,782. The unit of currency is the franc, equalling one-fifth of the belga. The Banque du Congo Belge issues notes and copper-nickel coins.

## Belgian Literature.

Perhaps the most significant feature of 1937 has been, on the one hand, the attempt to be independent of Paris, and, on the other, the honours paid to Belgian literature by Paris. Thus, many books have appeared in Brussels, particularly from the presses of the Belgian "Renaissance du Livre." The *Académie royale de langue et de littérature françaises de Belgique*, with greatly increased activities, was, at the end of the year, received with much ceremony in Paris by the *Académie française*. The *Prix Goncourt* was awarded for the first time to a Belgian, namely Charles Plisnier. The *Congrès des écrivains étrangers de langue française*, held in the summer in Paris, was presided over by a distinguished Belgian, Maurice Wilmotte. Finally, should be recorded the literary homage of the whole world, offered, with the co-operation of the Belgian Broadcasting Corporation, to Maurice Maeterlinck on

the occasion of his 75th birthday.

In poetry should be cited Bodart's *L'office des ténèbres*, Pierre Bourgeois' *Poèmes*, Carême's *Petite Flore*, du Dy's *A l'amie dormante*, Heux's *Symphonie Apollon*, Kochnitzky's *L'ermite entouré de feux*, Thiry's *Marchands* (containing short stories also), and Vivier's *Au bord du temps*. *Les Cahiers blancs*, a review devoted to poetry, philosophy, and high intellectualism, was founded at the beginning of the year by a group of young writers.

Belles-lettres and history were also represented in large number. Maeterlinck published *L'Ombre des Ailes*. Lameere studied *L'Esthétique de Benedetto Croce*, and de Reul *L'oeuvre de D. H. Lawrence*. Laurent wrote an erudite book on *La Draperie des Pays-Bas en France et dans les Pays méditerranéens*. Pirenne's *Mahomet et Charlemagne*, Moulin's *De Robespierre à Lenine*, and two books on King Albert, one by Cammaerts and the other by d'Ydewalle, should be indicated. Modern literature is studied by Gilsoul in an important book, *La Théorie de l'Art pour l'Art chez les écrivains belges de 1830 à nos jours*, and by Goffin in *Rimbaud vivant*. Poupeye writes on *Les Théâtres d'Asie*, and the "profils littéraires belges" has been enriched by several studies of contemporary authors. Father Maréchal published his collected thoughts on mysticism, in *Études sur la Psychologie des Mystiques*.

Amongst many novels, the following may be chosen: Charles Plisnier's *Faux-passeports*, Bosschere's *L'obscur à Paris*, Marie Gevers' *La Ligne de Vie*, Tousseul's *La Roche de la Mère-Dieu*, Franz Helens' *Le Magasin aux Poudres*, and two war books—Deauville's *Les dernières Fumées* and Linze's *Enfants bombardés*.

There were many notable works published in the Flemish language. In poetry should be mentioned Helderberg's *Dooitendans*, Verbeeck's *De Dwaze Bruij*, Vertommen's *Peillood*, and van de Wijgaert's *De Purperen Vlock*. Teirlinck wrote an important play, *De Ekster op de Galg*. Among the numerous novels the following were outstanding: Elschot's very well written *Pensionen*, Roelants' *Alles Komt terecht*, de Pillecijn's *Schaduwten*, Streuvels' *Levensbloesem*, Walschap's *Een Man van Goeden Wil*, and Ridwit's *Landrotten*. Two collections of short stories must not be omitted: Toussaint van Boelaere's *De Doode die zich niet verhing* and Berghen's *De Kleine Isa*. (S. L. EN.)

## Belgium

(Fr. *La Belgique*; Flem. *België*), North-west European kingdom, member of the League of Nations. Bounded N. by Holland, E. by Germany and Luxemburg, S. by France, and W. by the North sea. Capital, Brussels (*q.v.*). Ruler, King Leopold III (*q.v.*). National flag, black, yellow, and red, in equal vertical stripes.

**Area and Population.**—The area is 30,506 kilometres (11,775 sq. mi.), divided into 9 provinces, thus:

Province	Area (sq. mi.)	Population (1935 estimate)	Density (per sq. mi.: 1935)
Antwerp . . . .	1,104	1,224,337	1,109
Brabant . . . .	1,267	1,745,357	1,378
Flanders, East . .	1,147	1,181,728	1,030
Flanders, West . .	1,248	946,862	759
Hainaut . . . .	1,436	1,253,012	873
Liège (with Eupen and Malmédy) . .	1,525	971,937	637
Limburg . . . .	930	397,610	428
Luxemburg . . . .	1,705	222,808	131
Namur . . . . .	1,413	356,289	252

The census population (Dec. 1930) was 8,092,004, an increase of 0.84% per annum, (1935 figures: 8,299,940—4,103,573 males; 4,196,367 females). There is full religious liberty, no church being established. A majority profess Roman Catholicism; Protestants, Jews, and Anglicans are represented.

## BELGIUM

There are two main stocks, the Walloons, speaking French (42%) and the Flemings, Flemish, allied to Dutch; a small proportion speak German. The educated Belgian usually knows all three languages, and often English.

At least one primary school must be maintained by every commune, at its expense, relieved by contributions from the State and province. In 1935, 8,599 primary schools recorded 968,193 pupils; in 1934, 150 State secondary schools (100 for boys), 44,859; in 1935-36 the universities of Brussels, Louvain, Ghent (from 1930 a Flemish university), and Liège, 10,727.

The largest town is Brussels (exceeding 1,250,000), followed by (1935 populations): Antwerp (273,772), Ghent (165,269), and Liège (162,272). Mechlin, Borgerhout, Deurne, and Bruges exceeded 50,000, and seven others 40,000 each.

**History.**—Government is in the hands of the King and a parliament of two chambers, and is administered by a Prime Minister and a cabinet of 14 ministers. Universal adult suffrage and proportional representation are in force. The complement of the Chamber of Representatives, fixed by law prior to the elections of May 1936, was 202; the parties thereafter stood thus: Socialists, 70; Catholics, 63; Liberals, 23; Rexists, 21; Flemish Nationalists, 16; Communists, 9. In the Senate (167) proportions were similar.

The passage in June of the bill granting an amnesty to separatist Flemings, in respect of their efforts, during the World War, to divide Flanders from Belgium, released forces leading eventually to the downfall of the Government. The Flemish nationalists severed their pact with the Rexists. Ex-service-men's associations appealed to the King for a referendum on the amnesty question, declined on grounds of unconstitutionality. M. Léon Degrelle (Rexist), whose seat M. van Zeeland, the Catholic Prime Minister,

had won at an April by-election, levelled personal accusations at him and other ministers, one of whom replied with a successful action for slander. Liberal opinion forced another minister's resignation and, notwithstanding a vote of confidence, passed in September after his return from a mission of economic exploration to the United States, M. van Zeeland resigned on Oct. 25 from the premiership and parliament, seeking freedom to investigate the affairs of the National bank, and to clear himself of alleged complicity therewith.

Attempts to form a cabinet were protracted. Not till Nov. 24 did M. P. E. Janson (Liberal; formerly Minister of Justice; age, 65) take office as Premier, supported by 6 Socialists, 5 Catholics and 2 Liberals—the first Liberal ministry since 1884.

In domestic affairs a significant event was the rejection by the Socialist party of the Communists' "United Front." As to foreign relations, King Leopold's "neutrality" conversations in London (March) were followed by the release of Belgium from her reciprocal Locarno obligations, but with renewal of the Anglo-French guarantees against aggression. Later a German note guaranteed the inviolability of Belgium. The King paid other visits to England. A year's trade agreement was signed with the Union of South Africa, and one with France allocating traffic between Channel ports. Belgium's Oslo concessions (*see* NORWAY) were extended to France and U.S.A.

**Trade and Communications.**—Though 1935 saw a slight drop, more than half the land was under cultivation, pasturage and cereals leading. Among materials derived from natural resources, the output of wrought steel was the most valuable; this and pig-iron showed a continual rise to 1936. Coal-production, after a drop in 1932, increased steadily till 1935.

The 1930 figures showed close upon 2 million persons engaged in industries, in the following order: metals, textiles, mining, building, transport. More than half a million were commercially employed. In 1936, imports totalled frs. 21,505,682,000 (£146,300,-

KING LEOPOLD III of the Belgians escorted by King George VI of Great Britain to Buckingham Palace for a visit of state November 16-19, 1937

ooo), and exports frs. 19,944,275,000 (£135,700,000); an increase in both cases. Anglo-Belgian trade rose by 29% in exports from Great Britain, and by 17.5% in imports into Great Britain of iron and steel bars, flax, glass, bricks, cotton piece-goods, zinc, etc.

On Jan. 1936, there were 107 ships in the mercantile marine (247,344 tons). Road and railway facilities showed little change since 1935, when the Brussels-Antwerp line was electrified. Telegraphs and telephones showed slight increases. In 1935, 216 radiograph stations handled 22,056 messages; the external air services carried 65,728 passengers and 1,414,272 kilograms of merchandise.

**Finance and Banking.**—The franc continues the unit of domestic currency, but the use of the belga (=5 paper francs; at par, 35 belgas=£1), stabilized (March 31, 1936) at 72% of its former gold content, is obligatory in foreign exchange transactions.

The 1937 budget showed an income of frs. 10,736,424,000 (£73,037,000; increase: £2,088,700), rather under one-third raised by direct taxation, and expenditure of frs. 10,565,569,000 (£71,180,000; increase: £686,700). Direct taxation averages frs. 370 per head over the entire population. On Sept. 30, 1936, the total public debt was frs. 55,799,000,000.

The National bank, privileged to issue currency, had, on Feb. 11, 1937:

	Assets	Liabilities
Gold and silver . .	3,740,388,000 belgas	Notes in circulation: 4,493,282,000 belgas.
Securities . . . .	1,355,861,000 belgas	Current accounts: 822,030,000 belgas.
Totals . . . . .	5,096,249,000 belgas	5,315,312,000 belgas.

In the savings bank on Dec. 31, 1935, there were 5,566,414 accounts, totalling frs. 10,808,660,000.

BELGIUM: Industrial production index (*The Annalist*)

The army (part voluntary, part conscript; 18 months' service with the colours) had (1936) 4,460 officers and 63,000 other

LÉON DEGRELLE, 30, leader of Belgium's Fascist party

ranks; the air force, 210 aeroplanes. The military expenditure provided was frs. 886,400,000. The police had 157 officers, 6,289 other ranks. There is no navy, but one fisheries protection vessel is maintained. (See also SOCIALISM.)

**Benefactions:** see DONATIONS AND BEQUESTS.

**Benes, Edward** (1884- ), president of the Czechoslovakian republic. For a biography, see *Encyclopædia Britannica*, vol. 3, pp. 402-3. From the formation of the Provisional Government in 1918 until he succeeded Masaryk as president, Dec. 18, 1935, M. Benes was foreign minister; he was one of the founders of the Little Entente, a signatory of Locarno (1925), and in 1935 president of the Council of the League of Nations, of which he was always a staunch supporter. A life-long Socialist, M. Benes was much occupied during 1937 in maintaining the democratic status of his country and in resisting attempts at Nazification by Henlein and the Sudeten Deutsch Party (see CZECHOSLOVAKIA).

**Bequests:** see DONATIONS AND BEQUESTS.

**Berlin,** residence of the Hohenzollern electors, kings and emperors from 1442 to 1919 and capital of the German Reich since 1871, is also the largest and most important city of Germany. Reorganized in 1920 to include several suburbs, Greater Berlin in 1933 had an area of 332 square miles and a population of 4,242,501. Aside from its political advantage as a seat of the Prussian and German Governments, its commercial importance has been favoured for more than two centuries by its situation on the River Spree, affording cheap water communications through the wide-reaching German system of canals; later it became the centre of the German railway network, and more recently the central point of Germany's widely developed commercial air service. At its Tempelhof Airport, enlarged during the winter of 1937-38 to be the largest in Europe, 102 big aeroplanes arrive and depart every 24 hours. A great stadium and sport field was built in West Berlin for the Olympic Games of 1936, while at the same time a gigantic Reichsbank, Military Air Service building, and other large public works were rising to completion in the heart of the city. Two immense railway terminals, one on the northern and the other on the southern outskirts, are planned to supersede the ten existing but inadequate railway stations; a connecting tunnel will enable trains from Rome and the south and west to pass under Berlin and continue to Copenhagen and Warsaw and other points north and east. New automobile highways will converge at Berlin, but will also circle the city so that through traffic will not congest the capital. Hitler intends to transform the city during the next twenty years by a grandiose reconstruction program. At the laying of the cornerstone of the Faculty of Military Science, the first building of the new Berlin university, he declared on Nov. 27, 1937: "It is my unalterable determination to ornament Berlin with those streets, structures and public squares which will make it through all the ages the worthy capital of the German Reich. The size of these projects will not be measured by the needs of 1937. They will be planned with the knowledge that it is our duty to prepare a city that will stand a thousand years, worthy of the immeasurable future of a nation with a thousand years' history."

For the Berlin of earlier days, see the article BERLIN in the *Encyclopædia Britannica*. (See also HITLER, ADOLF.) \*

(S. B. F.)

**Bermuda,** a British insular colony 580 miles east of Cape Hatteras; language, English; capital, Hamilton (pop. approx. 3,000); governor, Lt.-Gen. Sir R. J. T. Hildyard. The area is 19½ sq.mi.; population (1931 census) 27,789; (official estimate, 1936), 30,552, including 59% negroes. The colony has an appointed governor and partly elected legislature. Suffrage is restricted to male free-holders. In Feb. 1937, the legislature rejected a very limited woman's suffrage. External communication is by Government-subsidized steamers. Test flights for regular aeroplane service were made in May 1937 and service started late in the year. The backbone of the colony's economy is the tourist trade, from which it derives 80% of its revenue. Imports, primarily foodstuffs and manufactured articles, in 1936 aggregated £1,891,676, over 50% from the British Empire (especially Great Britain and Canada), due to Imperial Preference. Dissatisfaction with the results of Imperial Preference was strongly manifested in 1937. Exports in 1936 were £135,812, less than half the 1934 total, with almost 40% to the British Empire. Only £55,820, chiefly in vegetables, lily bulbs, and flowers, was local produce. The unbalance of trade is covered by tourist purchases. The monetary unit is the pound sterling. Government receipts in 1936 aggregated £431,399, and expenditures £412,141. Education is compulsory. Schools are private, but with heavy Government grants. Total school enrolment in 1936 was 3,736.

(L. W. BE.)

**Bessarabia,** the district of Rumania lying between the Pruth and Dniester rivers, and thus between Moldavia and the U.S.S.R. The U.S.S.R. has not yet formally recognized Rumania's sovereignty, but has of recent years accepted it *de facto*. The area is about 44,422 sq.km. Population (1930) 3,092,949, of which the largest single element is Rumanian; there are also Russians, Ukrainians, Poles, Bulgars, Turks, Tatars, Germans, etc. It forms the "Regional Directorate of Chişinau," with nine departments. Largest city: Chişinau (Kishinev) with a population of about 115,000; seat of a metropolitan bishopric.

**Best Sellers:** see PUBLISHING: *Best Sellers*.

**Bevin, Ernest** (1881— ), British Trade Union official, was born near Bristol. Working in the Bristol docks, he became prominent in the affairs of the Dockers' Union, and one of its local officials. Transferred to its head office after the World War, he leapt into prominence by his advocacy of the dockers' claim for higher wages before the Shaw Commission, and was nicknamed "The Dockers' K.C." In 1923 he took the lead in a movement to amalgamate all unions catering for transport workers into the Transport and General Workers Union; he became general secretary, and the union is now the largest in the world, with over 500,000 members. A member of the General Council of the Trades Union Congress since its inception after the War, Bevin was its president in 1937, in which year he settled the "Coronation Strike" of London busmen by suspending their committee and negotiating terms himself.

**Bilbao,** a seaport of Northern Spain, capital of the province of Biscay and the largest of the Basque towns (estimated population Dec. 31, 1934, 175,900), is on the River Nervion, 8mi. from its mouth and 148mi. N.N.E. from Madrid. Its commercial importance is due to the iron mines in the vicinity, and to its overseas trade. During the early months of the Spanish Civil War

Bilbao was held by the Government, but by April 1937, the Insurgents were approaching the city, despite the reinforcements of planes received from Barcelona and Madrid on the 8th. On the 23rd and 25th British food-ships ran the blockade and re-provisioned the city, but on the 28th—after Guernica—the Basque Government proclaimed the evacuation of all non-combatants. By the end of the month General Franco's forces were within 11mi.; on May 6 5,000 refugees left for France escorted by British warships, and on the 20th 4,000 children left for Southampton. On June 8-9 the town was severely bombed from the air, and on the 12th the outer ring of defences was pierced. Heavy fighting followed; on the 18th the suburbs were entered and the Government fled; on the 19th the old quarter fell to the Insurgents, and on the 20th the city formally surrendered and became the base for Rebel operations against Santander. (See also SPAIN, CIVIL WAR IN.)

**Billiards,** somewhat dormant of late in the United States, showed signs in 1937 of long-awaited rejuvenation. Championship tournaments were staged in various sections of the country. Amateur as well as professional contests were frequent, resulting in the appearance of new players. The colleges and universities favoured billiards on a larger scale than hitherto.

Throughout 1937 two names dominated the sport, Willie Hoppe and Ralph Greenleaf, a pair of New Yorkers. Hoppe, the perennial "boy wonder" of the green baize, at 50 years of age—he began playing forty years ago—accepted the challenge of Jake Schaefer of Chicago and placed the world's 18-1 balk-line championship in jeopardy in a 3,000-point meeting with the son of one of the game's immortals, Jake Schaefer, the elder. Hoppe, stroking more consistently than he has in recent years, emerged on top by a comfortable margin of 3,000-2,567. A week later Hoppe and Schaefer, playing for the championship of the United States, introduced the French game of 71-2 balk line to the American public. Competing at this new style in which the table is marked off with six courts or boxes, as compared to the nine squares drawn for 18-1 and 18-2,

Hoppe again prevailed, the final count here being 2,694-2,376. The title, however, was decided on a block basis, which made no difference in the outcome, since Willie's advantage in blocks was 8 to 4. Displaying his versatility, Hoppe, in the tenth block amassed a high run of 248, unfinished, for a new world's record. The previous standard for 71-2 balk line was 223, credited to Roger Conti of France.

Greenleaf regained the world's championship at pocket billiards last spring after having been out of competition for a period of four years. Returning to action, the 37-year-old cue expert fin-

WILLIE HOPPE, U. S. champion, who broke the world's record for a high run in balk-line billiards

RALPH GREENLEAF of New York regains the world's pocket billiards championship

ished the regular tournament schedule deadlocked for first place with Irving Crane, youthful newcomer from Rochester, N.Y., Andrew Ponzi of Philadelphia, an erstwhile titleholder, and Jimmy Caras of Wilmington, Del., the defending ruler. When a first round-robin play-off among the four resulted only in the elimination of Crane, a second was ordered and Greenleaf won twice.

The next titular tournament was held in Philadelphia in November and the termination of the schedule found Greenleaf and Crane in a two-way tie for the honours. This time Greenleaf came through with one of the most amazing performances of his long career and he crushed his opponent with a 125-to-minus-1 conquest in the play-off.

(L. Ef.)

**Great Britain.**—No games showed a more marked advance in 1937 than did the games of billiards and snooker. Competitive play in clubs, institutes, and public rooms reached a high-water mark in the history of the game. In addition, billiards and snooker were introduced into thousands more homes by way of the 6ft. by 3ft. tables. It is estimated that over 3,000,000 people played games on billiard tables every day in 1937.

The standard of play in the higher branches of competitive billiards and snooker showed a notable advance, particularly among the amateur players. A young Birmingham engineer, Kingsley Kennerley, playing in the final round of the Amateur Championship of Billiards, surpassed the previous best achievement by amateurs in making a break of 549; and Joe Davis, champion of the world at snooker, made a world record run of 135 points in one break at snooker.

Women players also made a notable advance, one of the professional players, Miss Ruth Harrison, a native of County Durham, making a new world record with a break of 197 at billiards.

On the legislative side of the game, the Billiards Association and Control Council, the governing authority for billiards, snooker, volunteer snooker, pool, pyramids, and Russian pool all over the world, introduced some minor alterations and additions to the rules, and continued its program for development of games played on a billiard table.

Overseas tours were undertaken by three of the prominent professional players, Davis visiting South Africa and Horace Lindrum and Melbourne Inman making a round-the-world tour, taking in a flying visit to Lindrum's home in Melbourne. (W. G. CL.)

**Bingham, Robert Worth** (1871-1937), U. S. ambassador to Great Britain, was born in Orange county, N. C., Nov. 8, 1871. His early career was as a lawyer in Louisville, Ky.; but in 1918 he turned to publishing with the purchase of the *Louisville Times* and *Courier Journal*. He was appointed to his diplomatic post in 1933. Known in England for his conformity with British customs and for his championship of Anglo-American co-operation, he advocated lower trade barriers and a stabilized currency until forced to resign his position because of an illness which resulted in his death in Baltimore, Md., Dec. 18, 1937.

**Biochemistry.** It is convenient to divide biochemistry into three distinguishable though interrelated parts: (1) the isolation and chemical description of those substances of which organisms are made; (2) the description of the processes in which these substances are involved; (3) the description of the manner in which these processes are linked together inside the cell, so that the products or the energy liberated by one action may be efficiently transferred to the next; or the manner in which the energy that is liberated by a chemical action is used for doing external work. The first part has occupied the attention of biochemists and chemists for many years, and is often mistaken for the whole of biochemistry. The second part, the description of processes, is at present the most important and fruitful part of the subject. The third part promises to advance rapidly in the near future; it is this advance that leads us to think that biochemistry will do even more in the future for the clarification of biological thought and the improvement of medical technique than it has done in the past.

**Proteins.**—Much work has been done in recent years on the purification of proteins; this is especially interesting in the case of those proteins which are, or are associated with, enzymes, antibodies, and viruses. Several plant viruses have been obtained in liquid crystalline states, and some enzymes; e.g., trypsin, pepsin, urease, and carboxy-polypeptidase, have been prepared as crystals with a high enzymic activity. It is very probable that some of these products are in the chemical sense pure, but there is as yet no direct evidence on the point. The study of these preparations and of other highly purified enzyme preparations suggests that true enzyme activity cannot be found in the absence of protein molecules, and these studies have given us no reason to abandon the old hypothesis that part of every enzyme molecule is protein.

**Sugars.**—Since Haworth's demonstration that the simple sugars generally contain the six-membered pyrane ring, there has been little change in our main conceptions of sugar structure. From the biochemical viewpoint very interesting work is being done on related substances such as desoxy sugars (in vitamin B<sub>2</sub>, some nucleic acids and some pharmacologically active glucosides) and the substances related to vitamin C. There is also a growing interest in the rôle of complexes containing amino-sugars and uronic acids in immunological reactions. It is now reasonably certain that many of the substances concerned, for example, in blood group reactions, in the serological specificity of the serum proteins and many bacterial antigens, in the curing of some anaemias and the control of blood clotting, are of this type. The methylation technique and the methods of X-ray analysis are, in the hands of many workers, throwing valuable light on the constitution of polysaccharides of structural (cellulose, chitin), metabolic (starch, glycogen), or immunological importance.

**Chemistry of Muscular Contraction.**—There is now substantial unanimity that the main problem is not so much how a muscle contracts, but how, having contracted, chemical work is done to make it relax again. The protein micellae in a resting skeletal muscle fibre can, very approximately, be compared to

stretched springs held by a catch; they are ready to contract quickly, and then need an elaborate system of chemical actions to supply energy to restore them to the resting state.

It is possible to consider the problem at many levels of complexity; the single twitch, the twitch followed by recovery, the repeated contraction of the muscle in the absence of oxygen, and the normal working of a muscle supplied with both glycogen and oxygen so that the action may go on more or less indefinitely with the conversion of glycogen to carbon dioxide. It would seem that the action that is in most intimate association with the return of the muscle to its resting state is the breakdown of adenylyl pyrophosphate to adenylic acid and phosphate either free or combined with some other substance such as glycogen. The large group of enzymic reactions which has been so patiently explored by Parnas, Meyerhof, and others is mainly needed for the reconstitution of this adenylyl pyrophosphate by the transfer to adenylic acid of phosphate and energy. These actions involve the addition of phosphate to and its removal from hexoses, trioses, three carbon acids and nitrogen containing compounds such as creatine, and they have been studied by a very large number of different techniques. The direct or indirect chemical estimation of either the appearance or disappearance of a component of the action is of course the most simple method of following that action, but it has the defect that it cannot be used with very small amounts of material nor when different actions follow one another rapidly. These complex processes may be fruitfully studied on systems which have been partly poisoned by the addition of iodoacetate or fluoride which affect only a few of the processes, and so allow the products of these actions which are unaffected to accumulate, or on systems from which essential co-enzymes or intermediates have been removed; *e.g.*, by dialysis. The actual sequence of processes during a twitch is most readily followed by physical methods and measurements of the heat production, volume, transparency, birefringence, colour, and electrical state of a fibre have thrown much light on the mechanism of contraction.

**Industry.**—Since the direction of development in any science is largely conditioned by the sources of money endowing it, the links between biochemistry and industry are to be found in those industries, such as brewing and tanning, which are concerned with the chemical manipulation of biological products. To a great extent the biochemist in industry has been given the unexciting task of standardizing products, and, in some cases, unfortunately, arranging for their more skilful adulteration. Sometimes the probable value to industry of fundamental research has been appreciated; *e.g.*, the exhaustive study by Raistrick and his colleagues of the complex substances which moulds, growing under various conditions, can produce from sugar, was carried out for many years in an industrial chemical laboratory. This work is too recent for its commercial significance to be assessed properly, but the analogous processes for the production of citric acid by mould action and the well known fermentation processes for the production of acetone and butyl alcohol seem to be very successful. The value of biochemical research is also appreciated by the leather, wool, and wheat-milling industries.

**Medicine.**—Apart from the more definite aspects of the relationship between biochemistry and medicine, referred to above, there is the even more important, if subtler, influence which the biochemical attitude towards the living organism as an understandable system has on medical thought. For as long as the activity of a cell was looked on as being due to the almost mystical properties with which "protoplasm" was endowed, medicine was condemned to the humble rôle of trying to restore the sick to a more or less normal state. The recent development of dietetics has shown us how far removed this "normal" state may be from that which is attainable, even with existing knowledge. The

intimate knowledge which we are now getting of the internal workings of the cell is supplying an explanation of some of the phenomena of pharmacology and embryology, and holds out to medicine new possibilities for the modification and, from some points of view, improvement of the human race. It is reasonable to assume that, if biochemical research on the interrelations between different hormones, on the effects of known substances on the growth and division of cells, and on the chemical differences between different mental states, can continue at its present intensity, it will be possible within a few decades to regulate the onset of old age and to modify greatly the physical and mental development of individuals. These powers will, of course, present mankind with a new set of social or moral problems; the manner in which the conflicting interests of the individual and of the community are adjusted will call for new and interesting legislation. It is a fortunate compensation that the parallel advances in the biochemical interpretation of many sexual phenomena will so simplify the processes of contraception and the control of pregnancy that a number of present-day moral questions are likely to become merely academic.

During the next century the development of biochemistry and of the related sciences such as genetics will have as profound an influence on man's life as the development of physics and chemistry during last century has had on his environment. (*See also* PHYSIOLOGY.)

**BIBLIOGRAPHY.**—A. T. Cameron, *A Text-book of Biochemistry for Students of Medicine and Science* (Churchill, London); B. Harrow and C. P. Sherwin, *A Text-book of Biochemistry* (Philadelphia). These cover the groundwork of the subject. *The Annual Review of Biochemistry*, edited by J. Murray Luck Stanford. This consists of authoritative and up-to-date accounts of most branches of the subject. Discussions of the more speculative aspects of biochemistry will be found in *Perspectives in Biochemistry* (Cambridge University Press). (N. W. P.)

**Biography:** *see* AMERICAN LITERATURE; ENGLISH LITERATURE.  
**Biology:** *see* BOTANY; MARINE BIOLOGY; ZOOLOGY.

**Bird Refuges.** Under a national program of migratory waterfowl restoration in the United States, 17 new refuges were established by Executive order during 1937. The total number of Federal bird refuges is (1938) 209, embracing about 4,500,000 acres. Thousands of acres were added to existing refuges by purchase.

The U.S. Biological Survey is charged with the rehabilitation of land and water areas on a scale that, with restricted shooting everywhere, is designed to arrest the decline in numbers and the threatened extermination of certain ducks, geese, swans, and other migratory waterfowl. Water-impoundment structures have been placed on lands suitable for flooding to restore the proper habitat. Wild life technicians have supervised the planting of tons of duck-food and millions of food-bearing trees and shrubs. Nesting islands and game shelters have been constructed. Plants that retard the growth of desirable waterfowl food and cover have been eradicated. Upland tracts have been planted to grain crops for food and cover. The control of predators, highly detrimental to waterfowl, has been instituted on many of the refuges. It is estimated that on the refuges as a whole, bird populations are three to five times greater this year than when the emergency program was initiated in 1934.

Of unique character among the new acquisitions is the Okefinokee Wildlife Refuge in Southern Georgia, containing 292,000 acres. This wilderness area is becoming increasingly attractive to wintering waterfowl. The varied assortment of wild life includes the nearly extinct ivory-billed woodpecker, the limpkin, sandhill crane, black bear, and the Mississippi alligator. (*See also* WILD LIFE CONSERVATION.) (E. A. G.)

**Birmingham,** city and bishopric, Warwick., England; pop. (est.) 1,018,800; rate. value, £7,092,929; rates (1936-37) 14s.6d., (1937-38) 15s.; debt £55,700,000; area 51,147 acres. The second largest town in England and the sixth in the British Empire, Birmingham, "The Metropolis of the Midlands," runs its own gas, electricity, and transport undertakings, its baths, museum, art gallery, and school of art, etc., also its municipal bank; its manufactures are many, and include small-arms, bedsteads, jewellery, machinery, tools, bakelite goods, and practically everything connected with railway-stock, cycles, motor-cycles and cars, and wireless sets, as well as chemicals, chocolate, etc.

During 1937 a new telephone building in Newhall street, costing £600,000 and having the longest switchboard in the world (97ft.) was opened. The city's hospitals were greatly assisted by a munificent gift of £146,000 from Lord Nuffield, who desired it to be devoted to the College of Nursing and Nurses' Home. In August a new recorder, Mr. H. J. Wallington, was appointed. The bells of the cathedral were recast. A severe epidemic of influenza resulted in a total of deaths among the highest in the whole country. The parliamentary representation of Birmingham—which returns 12 members—received a blow from the death of Sir Austen Chamberlain, the vacancy in his division (Birmingham West) being filled in April by the election of Mr. W. F. Higgs (National Conservative), who had a majority of 2,920 over his Labour opponent, Mr. R. H. S. Crossman. During the year the city's industries continued to benefit by the trade-boom, the percentage of unemployment being one of the lowest in the country. Industrial disputes were few and unimportant, though the employees at a motor-works staged a new kind of strike—a "cold-weather strike"—refusing to continue work in unheated buildings.

**Birth Control.** Significant developments in the world-wide birth control movement in 1937 related to its legal and scientific foundations, extension of facilities, and a more rational understanding and acceptance of principles and methods. Increased medical approval and participation were marked.

**United States.**—Birth control under medical direction became legal on Nov. 30, 1936, when the U.S. Circuit Court of Appeals for the Second District rendered a decision in the test case of Dr. Hannah M. Stone, of the Birth Control Clinical Research Bureau, that the Federal obscenity laws do not apply to the legitimate activities of physicians, and that they may prescribe contraceptives in the interests of the health and general well-being of their patients. This decision terminated a long fight against an outmoded Federal law classifying contraceptive information and supplies with obscenity. Although the decision was handed down late in 1936, its impact and impulse to new activity were felt in 1937. This decision brought the movement to the goal it had sought through legislation.

The National Committee on Federal Legislation for Birth Control dissolved, and published a final report.

The American Medical Association approved birth control as an integral part of medical practice and education during 1937. This was one of the most important milestones in the movement. A report by a special committee was adopted by the association's House of Delegates. The association is investigating contraception and will promote the teaching of birth control in medical schools. The importance of its attitude and activities is outstanding.

*The Journal of Contraception*, the only technical publication devoted to the biological and clinical aspects of human fertility and its control, completed its second year under the auspices of the Birth Control Clinical Research Bureau, New York, and its 200 affiliated clinics. The scope of the Clinical Research Bureau was expanded. It has provided clinic service to 61,000 mothers, serves as a clearing house of information, and promotes new cen-

## BIRMINGHAM—BIRTH STATISTICS

tres. It is the first large centre for contraceptive counsel and the largest clinic of its kind. It enlarged its educational department, exhibited scientific films to medical groups, expanded its plans and began a campaign to induce public health authorities to provide birth control facilities. It continues its research on contraceptive products.

A temporary set-back came in one American State with the conviction of clinic officials and staff in the lower courts of certain Massachusetts cities. These cases are being appealed. Legalization stimulated efforts to incorporate birth control into the programs of public and voluntary health, welfare, child-caring and maternity organizations, medical colleges, hospitals, health centres, and clinics. Forty-nine new centres were opened in 19 States.

In some religious groups objections to birth control continue on grounds advanced as fundamental. Some rest, however, on the assumption of moral implications which ignore scientific facts and human realities. But the trend is steadily toward wider acceptance.

**Bermuda.**—Upon the invitation of the Department of Health Margaret Sanger visited Bermuda to help to establish birth control centres.

**Canada.**—The Ontario Court of Appeals dismissed an appeal from a magistrate's decision in a test case turning on whether an admitted violation of a statute was "for the public good," a victory for birth control.

**China.**—At the request of medical leaders, Mrs. Sanger planned to visit China, but hostilities with Japan interfered. The Chinese Medical Association approved contraception as a public health activity.

**England.**—Following representations by a group headed by Lord Horder representing the National Birth Control Association and allied societies, the Minister of Health increased the power of local maternity and child welfare centres to give birth control advice.

**Iceland.**—A law was passed directing the Minister of Health to provide physicians with birth control information when pregnancy threatens the health of mother or child.

**Japan.**—Impressive progress is being made in Japan under the leadership of Baroness Ishimoto.

**Puerto Rico.**—A bill passed by the legislature and signed by Acting Governor Ramos legalized birth control, following efforts instituted five years ago by ex-Governor Beverley. (M. SR.)

**Birth Statistics.** Adequate birth statistics are available for about one-third of the population of the earth. The annual average number of births in the United States was 1,818,262 for 1921-25, and 2,119,170 for the ten-year period 1926-35. It was 2,155,105 in 1935. In western and northern Europe the yearly number of births increased from 3,427,000 in 1841-45 to 4,599,000 in 1901-05. By 1927 it had fallen below the level of 1841-45; in 1933-36 it amounted to 3,172,000. In central and southern Europe it declined from about 5,445,000 in 1922-23 to about 4,895,000 in 1933-36. For the white population of the British empire it decreased from about 1,450,000 in 1921-26 to about 1,295,000 in 1927-32, and to about 1,200,000 in 1933-36.

The simplest method of relating births to population is to compute the yearly birth-rate, *i.e.* the rate of live-born per 1,000 inhabitants. The birth-rate in western and northern Europe dropped from 32 in 1841-85 to 24 in 1911-14 and to 16 in 1932-33. Owing to the recent increase in the number of births in Germany, it rose to 17 in 1934-36.

It declined in central and southern Europe from 32 in 1922-23 to 25 in 1934-36. It decreased, both for the white population of the British empire and for the United States, from 22 in 1921-26 to 17 in 1933-36.

## BISLETI, GAETANO—BLAKE, J. A.

The birth-rate shows the proportion by which a population increases through the birth of children; but it is not an adequate measure of fertility, since it is calculated without regard to the

*Birth Rate Averages, 1915-18, War Years, and 1925-34, per Thousand*

Country (Present Territory)	1915-18	1925-34
United States	24.8	18.9
France	11.0	17.7
Germany	15.7	17.6
England and Wales	19.5	16.2
Australia	26.2	19.6
Austria	15.2	16.7
Belgium	12.9	18.3
Irish Free State	20.7	19.8
Italy	23.0	25.7
Japan	32.5	33.3
Netherlands	26.0	22.6
New Zealand	25.3	18.8
Northern Ireland	21.9	20.7
Norway	24.3	17.1
Scotland	21.9	19.4
Spain	29.2	28.6
Sweden	21.0	15.3
Finland	24.9	20.1
Denmark	24.1	18.9
Hungary	18.3	24.9
Union of South Africa	29.0	25.3
British India	37.3	35.2
Chile	40.0	38.4
Uruguay	27.3	23.5
Switzerland	18.9	17.2

sex and age composition of the population. The best method of eliminating the influence of the sex and age composition is to relate the female births to the females living at the individual years of age. The sum of these specific fertility rates, which is called the gross reproduction rate, shows the average number of girls born to a woman who lives through the child-bearing age.

Until 50 years ago the gross reproduction rate exceeded two in every European country except France and Ireland. By 1895 it had dropped below two in England and Sweden. By 1910 it was below two in every country of western and northern Europe, and also in Australia and New Zealand. By 1925 it still exceeded two in Russia, in the Balkan States, in Poland, and it exceeded one in every country of Europe, as well as in every world area predominantly inhabited by whites. By 1935 Russia, apparently, was the only European country in which it exceeded two, and it was below unity in England, Norway, Sweden, Belgium, France, Switzerland, Austria, and Estonia. (See also POPULATION, MOVEMENTS OF.)

(R. R. K.)

### Bisleti, Gaetano

(1856-1937), Catholic cardinal, born at Veroli, Italy, March 20, 1856. A nobleman by birth, he first became connected with the Church as secret chamberlain to Pope Leo XIII in 1884. He held this post for sixteen years, handling the thousands of pilgrims who visited Rome to celebrate the Pope's golden jubilee during 1887-88. In 1900, he was appointed master of the bed chamber and as such was a close associate of the Pope. Upon the accession of Pope Pius X in 1903, he retained this post and became majordomo as well. He was created cardinal deacon on Nov. 17, 1911 and cardinal priest on Dec. 17, 1928. At the time of his death at Grotta Ferrata near Rome on Aug. 30, 1937, he was grand prior of the Order of Malta, prefect of the Sacred Congregation of Seminaries and Universities (a post he had held since 1915) and grand chancellor of the Pontifical Gregorian University and the Pontifical Institute of Music.

### Black, Hugo La Fayette

(1886- ), justice of the U.S. Supreme Court, was born at Harlan, Clay county, Ala., Feb. 27, 1886. He received his bachelor of law degree from the University of Alabama in 1906 and practised

FORMER SENATOR Hugo La Fayette Black questioned about Ku Klux Klan on his landing in America, after European vacation, to take office as a member of the United States Supreme Court

law until his election to the U.S. Senate in 1926. Re-elected in 1933, he was appointed to his present position by President Roosevelt on Aug. 12, 1937, and was confirmed by the Senate five days later. While the Senator was known for his interest in liberal legislation, his selection caused considerable embarrassment to the Administration when the *Pittsburgh Post Gazette* revealed that he had once been a member of the Ku Klux Klan and claimed that he had rejoined after having once resigned. On Oct. 1, Justice Black explained in a radio address that he had joined the Klan 15 years previously, had resigned and had never rejoined, not considering an "unsolicited" membership card given him in 1926 as membership of any kind. Criticism continued despite this explanation, but suits to prevent him from taking his seat were dismissed by the Court and agitation against the appointment gradually subsided. (See also SUPREME COURT OF THE U.S.)

**Black-Connelly Labor Standards Bill:** see UNITED STATES: *Labour*.

### Blackshirts.

Popular name of the Italian Fascisti, and hence applied to the British Union of Fascists, founded by Sir Oswald Mosley (*q.v.*). On Jan. 1, 1937, the wearing of the Blackshirt uniform became illegal in Great Britain and, with its picturesqueness, the organization lost most of its influence. In March, it created some disorder at Bethnal Green on the declaration of the London County Council election results, the voting for its six candidates having been negligible; in April, several of its leading members seceded and founded a rival body, the "National Socialist League"; in June was held a much advertised, and much interrupted, march from Kentish Town to Trafalgar Square, and in October, Sir Oswald and the district Fascist treasurer were injured by stone-throwing while attempting to conduct an open-air meeting at Walton, Liverpool, and taken to the hospital. (See also BROWN SHIRTS; FASCISM.)

### Blake, Joseph Augustus

(1864-1937), American surgeon, was born in San Francisco, Aug. 31, 1864. He was educated at Yale and the College of Physicians and Surgeons of Columbia University where he was a member of the faculty from 1891 to 1913. He was in Paris at the outbreak of the World War and immediately began surgical work which won him international renown. On returning to the United States in 1919, he practised privately until he became surgeon-in-chief at the Reconstruction Hospital of New York City in 1923. There he specialized in the handling of industrial accidents, but resigned in 1925 to undertake management of the Tarrytown

(N. Y.) Hospital. He died on Aug. 12, 1937 at Litchfield, Conn.

**Blind, Care of:** *see* SOCIAL SERVICE.

**Blum, Leon** (1872- ), French Socialist statesman, was born in Paris of well-to-do Alsatian-Jewish stock; he took degrees in philosophy and law, and for some years practised as a lawyer, while engaging in literary work as dramatic critic and author. Under the influence of Jaurès and the Dreyfus affair, he became an active Socialist, and in 1904 was concerned with Jaurès and Briand in the founding of *L'Humanité*, then a Socialist but later a Communist daily. This launched him into politics, but it was not until after the assassination of Jaurès (July 31, 1914) that he became a deputy; from 1919 to 1928, when he was defeated, he represented the Seine, and since 1929 he has sat for Narbonne, becoming in that year president of the Parliamentary group of the French Socialist party, and writing largely in *Le Populaire*. A great force in politics, he remained in opposition, refusing to accept responsibility without power until, after the triumph of the Front Populaire in May 1936, he became, on June 4, France's first Socialist prime minister.

During his term of office (*see* FRANCE: *History*), M. Blum had to contend with the situation arising out of widespread strikes, he introduced the 40-hour week, reformed the Banque de France, nationalized the war industries, de-valued the franc, actively opposed Fascism in France, and strengthened the defences and the navy. On May 23, 1937, he announced the Government's intention to give women the vote, and on the following day opened the Paris International Exposition; on June 21 he resigned office, after the Senate had refused to give him authority to attempt to overcome the country's financial difficulties by means of ministerial decrees instead of submitting measures to Parliament. In the new Front Populaire Cabinet immediately formed by M. Chautemps (*q.v.*), M. Blum became deputy prime minister, an office he continues to hold.

**Bohemia:** *see* CZECHOSLOVAKIA.

**Bolivia**, a South American inland republic on the Southern Andean plateau; language, Spanish; capital, La Paz; provisional president, Colonel Germán Busch. The area, including the Chaco region, disputed with Paraguay (approx. 100,000 sq.mi.), is estimated to be 514,464 square miles. The population is predominantly Indian, and was estimated at 3,170,784 (1935). The chief cities, with populations, are: La Paz, 142,549; Oruro, 40,000; Cochabamba, 35,574; Potosí, 34,084; Sucre, 33,983; Santa Cruz, 29,802.

**History.**—Internal developments in 1937 were to a large measure the outgrowth of the economic and social conditions resulting from the Chaco War with Paraguay, and were featured by political instability. In March, President David Toro's program of State socialism brought him into conflict with the Standard Oil Co. of New Jersey, whose 2,500,000-ac. oil concessions in South-eastern Bolivia were ordered confiscated. On July 13, the Toro Government was overthrown by a bloodless coup which brought 33-year-old Colonel Germán Busch to power as provisional president. President Busch, adopting a "middle of the road" policy, abandoned Toro's State socialism, immediately abolished the censorship in effect since the outbreak of the Chaco War, invited civilians into his cabinet, and promised early elections. He refused, however, to restore the Standard Oil concession, organizing a Government company to exploit the oil fields and by treaty with Argentina, Nov. 19, obtaining the right to export oil, tax free, through Argentina.

## BLIND, CARE OF—BONDS

Foreign relations in 1937 were chiefly concerned with the unsatisfactory progress of the Chaco negotiations (*see* CHACO). Cordial relations with Chile were furthered by a pact between the two countries to foster mutual trade and cultural relations.

**Trade and Communications.**—External communication is maintained by a railway to the Chilean port of Arica, over which Bolivia enjoys freedom of transportation, by railway to Argentina, and by regular air service. Bolivia has 1,244mi. of railways, and about 1,200mi. of good highways. Airlines link the various sections of the country, especially the eastern portion, which is unconnected by highways and railroads. Exports (about 70% tin) totalled 148,656,100 bolivianos in 1935; imports (chiefly textiles, foodstuffs, and machinery) were 70,893,351 bolivianos, leaving the largest export balance since 1918. As most of the foreign trade comes through neighbouring countries instead of directly, the destination and origin of goods is uncertain.

**Natural Resources.**—The principal resources are mineral. Bolivia is a principal world tin-producer, but labour shortage, due to loss of man-power in the Chaco War, has seriously curtailed production (*see* TIN). Oil-fields of Eastern Bolivia are beginning to be exploited. Except in the tropical north-east, high altitude precludes extensive development of agriculture, but the pastoral industry is of some consequence.

**Finances and Banking.**—The monetary unit is the boliviano (value: approx. 5¢ U.S.). The budget for 1937 contemplated a balance of revenues and expenditures at 200,067,000 bolivianos. The external debt of Bolivia, totalling \$61,648,024 and £147,520, is in default.

**Education.**—Education suffered a serious setback from the Chaco War, but plans have been laid for combating the high illiteracy. There are an estimated 1,600 primary and secondary schools and three universities. A military school and aviation school are maintained. The peace time army strength is 4,600 officers and men. (L. W. BE.)

**Boll Weevil:** *see* ENTOMOLOGY.

**Bonds.** As the world business fabric becomes more closely knit, economic trends in commercial nations, including the trends of security prices, parallel one another more closely, even when ostensible causes seem disassociated. Therefore a joint bond resumé of 1937 for the two great English-speaking democracies is not illogical as it might seem.

The end of 1936 saw the end in all probability of the great up-lift in demand for long and medium term loan-investments which began in 1932 as a herald or concomitant of industrial revival the world over. By November 1936 the demand for American bonds had become so insistent that prices in many instances "topped the all-time peak" of the great bond year 1902, when yield became so small that income considerations seemed hardly the prime motive in money commitment. Yet by April 1937 the prospect had changed and the decline in value, averaging perhaps 5% in the United States, was confined to no country nor type of issue. In the United States, where great Eastern banks carry heavy balances for the rest of the country and under mild duress invest them too heavily in Government issues, the fall in the price of governments has been referred to in print as a "near panic." To those conversant with the history of bond prices, such a decline was adequate warning of what might be expected of corporate shares during ensuing months. The American recession in stocks, which had at least a temporary culmination about October 21, was a not unnatural sequence and not wholly unexpected.

An obvious principal factor this year in the British bond price decline is the rearmament program which contemplates the expenditure of £1,500,000,000 during the next five years, of which

£400,000,000, or an average of £80,000,000 a year, will presumably be raised by long term financing. The effect on British bond prices arises not only from the greater supply of bonds, which in itself is not an alarming increase in relation to the national income, but also from the continuous and cumulative decline in the purchasing power of bond coupons through increased prices of goods and services as the rearmament program spending occurs. This epoch-making military program invites enormous economically non-productive activity; it tends to a dislocation of trade balances, to a decline in the ratio of exports to imports, to a loss of foreign markets in basic industries, and therefore to lower security prices. The end of such a road, however necessary the road, often is war, if for no other reason than to ward off the financial consequences. The program, like the American bureaucratic program, is malignantly cancerous.

Although important bond price decline is a normal anticipant of decline in other phases of financial well-being and in business activity, it does not follow that the attainment of a cyclical bond price zenith is presently to be followed by a major cyclical decline in industrial productivity and volume of commerce. Assuming that the bond price peak of a decade is behind us, there are good reasons for believing that the next deep valley is not immediately ahead.

The autumn of 1929 was the end of a business and of a stock cycle. The year 1937 may not mark the end of the recent recovery cycle in business or stocks. The severity of the 1937 decline in common stock prices in New York, comparable in degree with that of the autumn of 1929, may well represent an undue correction of values to meet business conditions, which the current expressions of attitude by the National Administration lead investors to expect. This decline may also be viewed as in part an adjustment to declining profit margins and working capital resources—a condition which, because it is not primarily economic but legislative, is subject to more prompt correction as the mistakes in these public policies become more evident.

In general, underlying conditions of today are by no means comparable with those of 1929. Economic tides, despite legislative and executive acts, are irresistible and irrevocable. When has there been a major business depression not immediately preceded by scarcity of money and strain on credit? These conditions have long been absent, notably in the United States where now the largest gold storage on record and exceedingly low rates for all classes of interest prevail. Although production now is generally able to supply current needs so that forward orders are not so much in evidence as recently, yet in certain basic industries such as construction, especially in the housing division, post-depression revival has made little headway in supplying the demand for increased facilities to meet population growth.

Subject therefore to the imminence or visitation of war, we may look forward with reason, born of experience, to a comparative stabilization of bond prices in the English-speaking nations at off-peak prices for many months to come, pending further mutations in the long term stock and business cycles that may be generally improving. In an era when national pledges have a tendency to relapse into scraps of paper, the stabilization may well be as effective in England, despite the armament program, as in the United States, which has to face a highly unstable equilibrium of a bank-owned national debt, and where some repudiation of debt by a devaluation of the dollar has already occurred. Looking beyond, a time-lag of years is not unusual between budget unbalance, burdensome debts and devaluation on the one hand and real inflation with its visitation on creditors including bond owners on the other. Probably British financial acumen will offset American natural resources as a retardant of the day of reckoning. (See also STOCK EXCHANGES: *Stocks and Bonds*.) (L. CH.)

**Bonneville Dam:** see DAMS; WATER POWER.

**Bonus:** see ADJUSTED COMPENSATION.

**Book-collecting.** Acquisition by the British museum of the Ashley library, formed by the late Thomas J. Wise, was the most momentous event in the world of book-collecting during 1937. The price was not announced, but was generally believed to be in the vicinity of £100,000. The acquisition was regarded as the most important since the institution was bequeathed the Thomas Grenville collection in 1846. Inevitably the death of Wise in May, at 77, revived discussion of the spurious pamphlets (notably the Reading "Sonnets" of Elizabeth Barrett Browning) which had been exposed two years earlier with such devastating thoroughness by John Carter and Graham Pollard. The Ashley library embraces wide areas of post-Elizabethan English literature—largely, but not wholly, poetry, with particular emphasis on the romantic revival and the Victorian era.

From the Yale University Press, under the editorship of W. S. Lewis and A. Dayle Wallace, issued the first two volumes of the collected edition of the letters of Horace Walpole—his correspondence with the Reverend William Cole. This conspectus of 18th-century life as reflected in the alert and urbane communications of one whose interests covered most of its phases is the concretion of years of specialized collecting activity on the part of Mr. Lewis, and is the direct and inevitable outgrowth of his industry and judgment.

Another evidence of the creative potentialities of collecting appeared in the announcement by the Huntington library, San Marino, Cal., that it will publish a definitive edition of Benjamin Franklin's autobiography from the holograph manuscript in its possession. Completion of the project will signalize the happy ending of the fantastic adventures of a classic. Published first at Paris, in French, in 1791, the autobiography was issued in German and Swedish before its appearance, in a garbled version, in English. John Bigelow, while American minister to France during the American Civil War, instituted a search for the original manuscript, which came to light as a result of his activities following his return to the United States. Bigelow then prepared (1868) what had always been accepted as the definitive edition, but comparison of his published text with the manuscript has disclosed numerous errors in transcription, alterations, and unintentional but annoying emendations. These the Huntington edition will repair.

The year was rich in the fruits of bibliographic research. Notable productions in this department include Geoffrey Keynes's monograph on the books of John Evelyn (Cambridge University Press and the Grolier Club), Thomas Franklin Currier's monumental bibliography of John Greenleaf Whittier (Harvard University Press), and the imposing first volume of the catalogue of the tobacco collection formed by George Arents, Jr., compiled by Jerome E. Brooks (Rosenbach, New York). (J. T. W.)

**Booklist:** see AMERICAN LIBRARY ASSOCIATION.

**Books:** see PUBLISHING.

**Book Sales.** Sales in the United States showed a slight falling off both in the quantity and the quality of material. Nevertheless there was a steady flow of books to the auction rooms, and two sales of outstanding interest were held. The first was the library of George Allison Armour, which fetched \$85,528.00 and included Keats's copy of Shakespeare in seven vols., which sold for \$31,000.00. The second was the Fitz Eugene Dixon collection of sporting and colour-plate books containing the finest collection of Henry Alken's prints and drawings ever made. The series of aquatints of *The Beaufort Hunt* sold for \$12,000.00. Rare books of the 19th and 20th cen-

turies continued to maintain their price last year. The first edition of Miss Braddon's *Lady Audley's Secret* was sold for the extraordinary sum of \$2,200.00.

After several lean years, some old libraries of the utmost importance found their way to the auction rooms, as well as many miscellaneous books consigned both by English and Continental owners. The level of prices was generally good, and in many cases new high records were made.

The first important sale of the year in London was that of Lieut.-Col. W. G. Moss's books in March, which totalled £15,959 11s. 0d. The highest prices were given for original editions of Blake, *Songs of Innocence and of Experience* fetching £1,400 and Young's *Night Thoughts*, with illustrations coloured by Blake himself, £800. In the same month, the first portion of Lord Aldenham's books was sold for £28,846 15s. 0d. The collection was rich in manuscripts; two missals fetched £2,300 and £2,000 respectively. In April, the A. W. Mensing collections from Amsterdam were sold at Sotheby's, the library alone yielding £29,000. Thirty-nine lots of letters from Elizabeth Barrett-Browning were sold in June for £2,706, and 60 lines in Keats's autograph for £950. The same month saw the beginning of the dispersal of the great library of the 7th Duke of Newcastle. Thirty-four lots, mainly manuscripts, sold for £38,055. The highest price, £13,500, was paid for the *Hours* of Isabel of Brittany. Audubon's *Birds of America* sold for the record sum of £2,500. On June 21 an imperfect copy of one volume of the Gutenberg Bible realized £8,000. In July, the interesting library of the Earl of Lonsdale was sold. It contained many early atlases and geographical works. Though no sensational prices were paid the level for this class of book showed a great advance.

In the autumn, two more sales of the Duke of Newcastle's books were held, including a large collection of works from the Aldine press and fine bindings.

On Dec. 6, the *Psalter of Henry IV*, belonging to the Earl of Lonsdale, sold for £5,000. (J. I. D.)

**Bootlegging.** Liquor, as applied to illicit liquor, is no less a problem now than during the Prohibition era in the U.S., or in pre-Prohibition days. During the five years (1915-19) before national Prohibition an average of 4,000 illicit stills per year, 7,000 for six months, July 1919-Jan. 1920, and about 10,000 per year for the 13 years of Prohibition (1921-33) were seized. Illicit still worms and fermenters seized numbered 250,000 in one year. The total appraised value of the property seized varied from \$200,000 to \$2,000,000 per year, 1915-19, and from \$8,000,000 to \$30,000,000, 1921-33. The latest figures (1937) give 16,142 stills seized with over 12,000,000 gals. mash and 4,760,521 gals. spirits seized, together with other property with appraised value of \$3,965,360. Arrests for Federal liquor law violations were 29,477.

The U.S. attorney-general reports (1937) 26,784 individual defendants in cases filed, 20,162 of which were defendants in liquor tax cases, and 21,550 convictions.

The various State liquor control boards or authorities have also a big bootlegging problem in tax evasion and illicit practices under State and local regulations.

**Coal.**—Increased governmental regulation creates a bootlegging problem in other industries. Last year bootleggers mined and sold illegally 2,400,000 tons of anthracite coal, employing 13,000 men, for which consumers paid \$16,000,000. It represented about 5% of total legal output. The underlying social problems of maladjustment and law enforcement are significant. "Hot oil" and even "hot money" are further illustrations of illicit practices that may become as perplexing problems as bootlegging in the liquor industry. (See also LIQUOR LAWS.) (S.McC. L.)

**Borden, Sir Robert Laird** (1854-1937), Canadian statesman, who was Prime Minister during the war years and Conservative leader from 1901 to 1920. He was Canadian representative in the Imperial War Cabinet, at the Paris Peace Conference, at the Washington Conference of 1922, and in the League of Nations. He held honorary degrees and awards from many universities and foreign countries, was president of the Crown Life Insurance Company and Barclay's Bank of Canada, and was author of *Canadian Constitutional Studies* and *Canada in the Commonwealth*. He died, June 10, 1937, at Ottawa. The *Encyclopædia Britannica* gives a full account of his life in vol. 3, p. 896.

**Borneo**, island of the East Indies, north of the Java sea, divided from Celebes by the Straits of Macassar; the southern part, about 207,000 sq.mi. in area, is a Dutch possession; the north and north-east is British, consisting of the State of North Borneo (31,100 sq.mi.), a British protectorate since 1888, ruled by the British North Borneo Company; Brunei (*q.v.*) and Sarawak (*q.v.*), both under British protection.

**State of North Borneo**, has a population (1931) of 270,000, mostly Mohammedans and pagans; there are 340 Europeans and some 50,000 Chinese. The capital and largest town is Sandakan (population 13,900); the second town is Jesselton. Jungle and other tropical agricultural products, such as timber, rubber, tobacco, rice, sago, coco-nuts, etc., are exported. There are about 130 mi. of railway. Revenue and expenditure in 1935 were £327,500 and £209,000, and the value of exports and imports £952,000 and £594,000 respectively. A state bank is established at Sandakan.

The local defence force is an armed native and Indian police numbering about 500, officered by Europeans.

**Dutch Borneo**, under the governor-general of the Netherlands East Indies at Batavia (Java), is divided for administrative purposes into a Western and a Southern and Eastern District. Its population at the 1930 census was 2,194,500. A concession for timber working has been granted to Japan.

**Bose, Sir Jagadis Chandra** (1858-1937), Indian physicist, was known widely for his experiments demonstrating the similar reactions of plants and animals to outside stimuli, for his apparatus for measuring minute plant movements, and for his work with electric waves (*q.v.* *Encyclopædia Britannica*, vol. 8, pp. 302-303). An account of his life may be found in the *Encyclopædia Britannica*, vol. 3, p. 926. Born in Bengal, Nov. 30, 1858, he died at Giridih, Nov. 23, 1937.

**Boston**, seaport at the head of Massachusetts bay; capital of the State of Massachusetts, U.S. Population (1930) 781,188 (229,356 being foreign born whites): 1935 (State census) 817,713. Its metropolitan district (U.S. census), including 80 cities and towns, is fifth in population in the United States, (1930) 2,307,897; (1935) 2,385,465. The officers (1937) were: mayor, Frederick W. Mansfield; city clerk, Wilfred J. Doyle; finance commission chairman, David Lasker; school committee chairman, Frederick R. Sullivan; city attorney, Harry E. Foley; police commissioner, Joseph F. Timilty. City employees numbered 21,025. A new mayor (four year term) and city council (two year) and a school committee member were elected (non-partisan) in November to take office in Jan. 1938. Maurice J. Tobin (Dem.) defeated four other candidates for mayor, receiving 105,212 votes from the 320,487 cast. Ex-Governor James M. Curley (Dem.) ran second with 80,376 votes.

Balancing the budget, reducing the tax rate and relieving traffic congestion were the principal problems. The 1937 tax rate was

\$38.70 per \$1,000 on an assessed valuation of \$1,620,265,000 but revenue did not cover current expenses which were increased by the business recession and by the maintenance of new construction. Net funded debt (August 31): \$130,507,924.95.

W.P.A. projects included the completion of a surgical building at the City hospital, a new municipal golf course, and the beginning of a Huntington avenue subway. The Suffolk county courthouse under construction in 1937 will overshadow the State Capitol, long the dominant feature of the city.

Boston maintained 293 school buildings and 4,730 teachers. Enrollment (1936): elementary 100,626 (declining since 1933); high 32,742; evening 14,093. Expenditures (1936): \$19,658,843. Appropriations (1937) \$17,239,170. College and university registrations increased in 1937 and Boston university and Northeastern university initiated extensive building programs.

Twenty-eight hospitals (six tax-supported) had 123,305 patients in 1936. The overseers of the poor (1937) expended \$11,684,201.61 and managed 19 permanent charity funds totalling \$761,670.93. Cases for week ending December 31 were: dependent aid 15,150; mother's aid 1,601; old age assistance 7,771. The city is trustee for 176 funds for civic betterment totalling \$14,071,970. A federation of 109 institutions in the metropolitan district raised a 1937 Community Fund exceeding \$4,000,000. The Federal unemployment census (preliminary report) showed 43,234 totally unemployed; 20,052 on emergency work; 15,466 partially employed, November 1937. The police force consisted of 2,174 officers and patrolmen. Total arrests: (1936) 81,348; (1937) 95,948.

Total bank resources exceeding \$3,000,000,000 and the Federal Reserve bank (first district) make Boston the financial centre of New England. Total deposits of all banks (1936): \$1,934,418,000. Deposits of the eight largest banks (1937): \$1,074,167,299, a decline of \$65,442,402.

Boston is the chief U.S. wool market and an important fishing port. Wool receipts: (1936) 318,106,000lbs., (1937) 321,251,000lbs. Fish landed: (1936) 339,224,764lbs., (Jan.-Nov. 1937) 298,348,475lbs. The Massachusetts customs district ranked second in the value of imports (Jan.-Nov. 1937). Total commerce of the Port of Boston (1936) 17,214,140 tons (of 2,000lbs.); imports, 2,734,507 tons; exports, 312,416 tons. Passenger traffic to foreign ports (1937): arrivals 57,284 (5.4% increase); departures 16,395 (10% increase).

In 1936 the 2,249 manufacturing establishments had an invested capital of \$231,685,093; used materials worth \$209,264,399; paid \$69,655,055 to an average of 59,409 wage-earners and created a product valued at \$411,706,145. Additions in 1937: 106 new establishments, 113 expansions. Building permits increased (1936-37) from \$11,810,103 to \$18,414,997. (S. J. McK.)

## Botanical Gardens.

The director of the New York botanic gardens, Dr. M. A. Howe, died, and Dr. H. A. Gleason was made deputy in his place. Mr. Henry Teuscher resigned to become superintendent of the Montreal botanic garden. The largest flower in the world, *Amorphophallus titanum*, native of Sumatra, which has twice bloomed at Kew, flowered in the New York botanic garden in June. The bloom was 12ft. in circumference, yellow and green outside, maroon inside, with an overpoweringly offensive odour. (See Illustration in BOTANY.)

Over \$600,000, the Maria Moors Cabot Foundation, was given to Harvard university by Dr. Cabot for work on increasing the production of cellulose by plant and tree breeding and by improving forest soils. The Arnold Arboretum will share in this work.

Research on modern species of *Nicotiana* was carried out at the University of California botanic gardens, which sent an expedition to the Andes from 1935 to 1937 and also to collect plants on the

east coast of South America. At the Blaksley botanic garden, Santa Barbara, Calif., new greenhouses and a laboratory were under construction. The new director is Mr. Maunsell van Rensselaer.

Except for a small nursery, no planting was done on the 386ac. National Arboretum at Washington. The acting director died in January and no successor was appointed.

**Great Britain.**—Changes of staff at the Royal botanic gardens, Kew, London, in 1937, included the appointment of Dr. E. G. S. Brown as temporary assistant in place of Mr. A. R. Horwood, who died in February, and had worked on the identification of European and oriental collections, and in arranging the genera of the Compositae and other families. The curator, Mr. Coutts, retired in August, and Mr. Campbell was appointed. Miss Fitch retired after 45 years' service. Mr. Pearce was made assistant curator, controlling the decorative department. Medals commemorating Their Majesties' coronation were sent to the director, Dr. Sprague and sergeant constable Sealy.

**Canada.**—The *Jardin Botanique de Montréal*, established in 1936, was being laid out. The official inauguration is planned for Montreal's third centenary in 1942. In conjunction with Montreal university, an exploration of the valley of the St. Lawrence was carried out, particularly for alpine-arctic plants, to acclimatize them to the botanic garden.

**Europe.**—In Belgium, transfer of the botanical garden at Antwerp to the Parc des Rossignols began by the removal of the rosery. At Brussels the Government decided to remove the State botanic garden to a site six kilometres away.

At the gardens at Bagnères de Bigorre, France, work on virus diseases of the potato was carried out.

Karel Domin took the place of the late Count Silva-Tarouca, founder and director of the dendrological garden at Pruhonice, Czechoslovakia.

**Asia.**—In memory of Dr. Melchoir Treub, director of the botanic gardens, Buitenzorg, Java, a Treub fund was established to maintain and extend the scope of the institutions comprising the Government botanic gardens in Java, to support research and issue publications. Dr. van Steenis of Buitenzorg made collections in Atjeh, on summits above 3,000 feet. (V. R.)

**Botany.** In the botanical sciences, the year 1937 and those immediately preceding it have been characterized rather by the rapid expansion of activity in some branches than by any spectacular discovery. Systematic and morphological work have gone steadily on, but the bulk of published research has undoubtedly been in the more dynamic parts of the subject, particularly in physiology.

**Plant Physiology.**—A large amount of the published work deals with research in transpiration, assimilation, and respiration along lines already laid down. It is in the investigation of growth phenomena, however, that the most outstanding results have been achieved. For the past two or three years there has been a constant accumulation of data of the most diverse character bearing upon the subject of growth in its various aspects, particularly in connection with growth-promoting substances (auxins), photoperiodism, and correlations between different organs of the plant. The discovery of such growth-promoting substances as phenylacetic acid and  $\beta$ -indolyl acetic acid (the "hetero-auxins") has been followed by that of many other compounds having similar properties to those of the biologically produced auxin itself, e.g. the stimulation of cell multiplication and stretching, and present research is directed towards finding some explanation of the action of these substances upon the plant. Important papers lately published deal with the paradoxical action of auxin itself within the plant. This growth substance is produced at the apex of the stem and in the young leaves surrounding it, and is passed

THE WORLD'S LARGEST FLOWER, called Krubi in its native Sumatra, blossoms to a height of 8½ feet in New York Botanic Gardens

down the shoot, where it inhibits the growth of the lateral buds, yet stimulates that of the internodes and favours cambial activity. It also inhibits growth in the root unless a sufficiency of sugars is present.

**Photoperiodism.**—In problems involving photoperiodism (the effect of long or short periods of daylight upon the flowering of the plant) and particularly those concerned with the change from the vegetative to the reproductive phase of the plant, there is, according to recent American and Russian work, evidence of the activity of growth-promoting substances. For example, by localized illumination of chrysanthemum plants from which the upper leaves have been removed, it has been shown that the onset of flowering is determined by the light-period received by the remaining lower leaves, which seems to indicate that some controlling substance is formed in them which travels up to the growing point and initiates flowering. Other experiments demonstrating the appearance of flower buds on "short-day" species of *Helianthus*, grafted on flowering "day-neutral" species, and others in which underground tuber formation was induced in *Helianthus tuberosus* by short-day illumination of the apex of the plant, tend to confirm the hormone hypothesis, and raise the questions of the formation, transport, and action of these formative substances.

**Plant Nutrition.**—During the past year or two there has been an increasing volume of work on the soil nitrogen supply and micro-organisms and their relations to plant nutrition and "soil-sickness." Among more recent concepts is that of the possibility of beneficial root-excretions, to which the older view ascribed toxic properties and the responsibility for soil-sickness. Lately, a large number of important papers have appeared on the subject. The work of the Finnish physiologists indicates that aspartic acid,  $\beta$ -alanine, and other substances are excreted by leguminous root-nodules, and are reabsorbed by grass crops which are

interplanted with them, to the benefit of the latter.

**Ecology.**—Although a good deal of descriptive work continues to be published, recent years have seen a great development of the physiological side of ecology, particularly with regard to xerophytes and halophytes. At the same time, an increasing use of statistical method in the analysis of vegetation is being made. On the economic side research is being carried out upon grassland, particularly from the aspect of sward improvement of hill pastures.

**Fungi.**—Research continues upon the nuclear relations of all groups of fungi, while one of the most interesting developments of recent years, upon which work is still actively going on, is the clearing-up of the life-history of the rust fungi (*Puccinia* spp. et al.). These rusts, which pass part of their life-cycle on a second host, form upon it two visible bodies, the spermogonia and the aecidia, which produce the aecidiospores, which in their turn reinfect the primary host. It is now known that the spores of the primary host which infect the secondary host are of two strains, "+" and "-". Either type of spore will produce mycelium and the flask-shaped spermogonia which later extrude a fluid (nectar) containing large numbers of minute cells, known as spermatia, whose function hitherto has not been understood. The important discovery is that before the aecidial stage can form, there must be fusion between cells of the "+" and "-" strains of the fungus. If one leaf should be infected by spores of both strains, the fertilizing fusion may take place between hyphae within the leaf. It may also, however, be brought about by flies or other crawling insects, which transfer the spermogonial nectar with its spermatia to other infections of the opposite strain, thus enabling fertilization to take place, and aecidia to form. The existence of the different strains means that hybridization of the fungus regularly takes place. We can now therefore follow the whole life-history of some of the rusts, with the exception of certain cytological points which are not yet cleared up, notably the details of the fusion and the rapidity with which the fertilization or "diploidization" spreads along the cells of the hyphae. It is upon these lines that present research is proceeding.

Among other important recent work is that on "biological antagonism" in soil, which results in the disappearance of certain fungi from it—a fact which has important implications in the rotation of crops. In fungi, also, there has been discovered a spore-producing substance, analogous to the auxin type of hormone of the higher plants, which influences the onset of sporing in certain fungi.

**Algae.**—In the green algae, new species have been recorded,

KNOWN TO BOTANISTS as *Amorphophallus titanum*, the Krubi has an offensive odour that attracts carrion insects for pollination. Looking like a giant ear of corn, it puts up new growth every 18 months

and the working-out of life-histories is proceeding. In the brown algae, recent work has shed light on the life-history of a number of so-called "summer annuals" whose life-cycle has been shown to contain either a microscopic gametophytic phase or a minute discoid body, the *plethysmothallus*, which reproduces for several generations by means of plurilocular sporangia, and ultimately gives rise to the ordinary conspicuous phase. Recently, also, the classification of the brown algae has been under review.

**Other Groups.**—In the bryophytes, apart from systematic work, the question of the conduction of water in the mosses is still at issue, while in the pteridophyta perhaps the most interesting work is that on the presence of "vessels" in the wood of certain ferns; the vessel having hitherto been known only in the flowering plants. In palaeobotany, the Kidston collection of fossils is being re-examined, while new species have been recorded from India and the Devonian of Australia. In the gymnosperms and the angiosperms no important changes have occurred. (F. Y. H.)

**Boulder Dam:** see AQUEDUCTS; NEVADA; WATER POWER.

**Bowling.** The far-reaching extent of bowling in the U.S. is not generally known even to Americans. In contrast to the days of Peter Stuyvesant, who is credited with originating the game outdoors on Bowling Green, N.Y., during the Dutch occupation, bowling is now played indoors by about 10,000,000 active bowlers, on approximately 160,000 alleys.

The biggest bowling championship tournament in the U.S. and in the world is sponsored by the American Bowling Congress, held in New York during 1937, attracting 22,000 competitive bowlers from all parts of America. Last year 384 tourneys and 18 State tourneys were supervised by the A.B.C., the controlling organization in the U.S.

Champions of the A.B.C. for 1937 are:

Five-man teams—	Krakow Furniture Co., Detroit, Mich. . . . .	3118
	Waldorf Golden Bock, Cleveland, Ohio . . . . .	3111
Two-man teams—	V. Gibbs and Nelson Burton, Dallas, Texas . . . . .	1359
	Walter Zanger and Val. Metts, Louisville, Ky. . . . .	1329
Individuals	—E. Gagliardi, Mt. Vernon, N.Y. . . . .	749
	E. Soest, Santa Monica, Calif. . . . .	729
	W. Ahnert, Elgin, Ill. . . . .	728
	W. Knox, Philadelphia, Pa. . . . .	725
	P. Crane, Montclair, N.J. . . . .	725
All Events	—Max Stein, Belleville, Ill. . . . .	2070
	Walter Ward, Cleveland, Ohio . . . . .	2039
	Ned Day, Milwaukee, Wis. . . . .	2014
	John Crimmins, Detroit, Mich. . . . .	1982
	Otto Jasper, Cincinnati, Ohio . . . . .	1980

(J. B. P.)

**Bowls.** This game, known in America as lawn bowls, had its American beginning in early New York when the early Dutch settlers played the game on Bowling Green, in 1690 or earlier. In its competitive aspect, the game has been under the control of the American Lawn Bowling Association since 1915 and championships have been held every year since 1918 for the M. F. Robertson trophy. There is also an annual singles championship for the Robert D. Kay trophy and a doubles title event for the Boston Scottish Border Club trophy.

The game is played extensively in Florida, particularly in St. Petersburg, where annual trophies are awarded by the local chamber of commerce and the St. Petersburg press, for singles and doubles winners. Many of the contestants are winter vacationists from all parts of the U.S. and Canada.

**Great Britain.**—The ability of English bowls enthusiasts was fully tested during the 1937 season. The extremes of weather conditions—first of all very wet, with a long dry spell later—made adaptability an essential to consistent success.

Nevertheless, the national championships produced play which, in the all-round sense, reached a high standard. The singles con-

test was won by W. Prentice, of Redcar Zetland B.C., who thus gained his initial success. The pairs event produced a novel result, the victorious couple being A. W. Knowles and his son, A. W. Knowles, Jr., of Worthing B.C.

JOE LOUIS, in 1937, won the world's heavyweight championship from Jimmy Braddock

Out of an entry of 2,055 in the rinks contest, the championship went to Sheen Common B.C. For the tenth time Surrey emerged triumphant in the inter-county championship for the Middleton Cup. In the final tie they had a narrow victory over Hampshire, who have now been concerned in the final tie in four of the past five years. The international championship, played in Wales, was won by that country, with England second, Ireland third, and Scotland in the unusual position of "wooden spoonists."

**Boxing.** A new heavyweight world champion appeared in 1937. Certainly, the meteoric climb of the Negro, Joe Louis, the Brown Bomber from Detroit, Mich., reads like an old-fashioned success story. He rose from a lowly labourer's position in an automobile factory to win boxing's richest prize. Set back rudely by a knockout in June 1936 before the flying and potent fists of the German Max Schmeling, the Negro gladiator fought his way back to top-notch recognition and on June 22, 1937 at Comiskey park in Chicago climaxed a most amazing ring career by knocking out James J. Braddock in the eighth round with a right to the jaw. Nor was the new king of the heavyweights content to rest on his newly-won laurels. Setting some sort of a precedent Louis defended the championship a little more than two months later, outpointing Tommy Farr, the rugged Tonypandy Welshman. Few champions in the past have placed their crowns in jeopardy so soon after having annexed them.

Optimistic talk of the "good old days," million-dollar gates and elaborate promotions, followed the Louis-Braddock bout, which attracted a gross gate of \$640,420, although his subsequent meeting with Farr grossed only \$265,000. The poor showing in this

JIMMY BRADDOCK just before he lost world's heavyweight championship to Joe Louis

fight was due mostly to the lack of confidence in Farr's ability. But Tommy surprised everyone with his brilliant showing against the Negro. In fact, there were some who disagreed with the decision.

Mike Jacobs, the directing brains of the 20th Century Sporting Club, forged to the front in 1937 as the world's outstanding promoter, even to the extent of taking over control of boxing in Madison Square Garden. Jacobs leased the famous

arena and with the New York ball parks tied up by him for outdoor extravaganzas, became a sort of "czar."

The boxing game prospered generally among the smaller men also in 1937. Freddie Steele of Tacoma, Wash., middleweight champion of the world, was the most active ruler (aside from Louis) who had five fights during the year. Steele successfully defended his title four times, turning back the challenges of Willie Jones, Babe Risko, Frankie Battaglia, and Ken Overlin. The Carnival of Champions, a "dream" program promoted by Jacobs at the Polo grounds, New York, saw Lou Ambers, lightweight champion, conquer Pedro Montanez, promising Porto Rican; Barney Ross of Chicago, the welterweight king, defeated Ceferino Garcia, speedy Mexican; Harry Jeffra of Baltimore dethroned Sixto Escobar as bantamweight champion; and in a fourth bout, Fred Apostoli, Pacific coast middleweight, scored a technical knockout over the French veteran, Marcel Thil.

The latter was recognized as titleholder by the International Boxing Union.

Henry Armstrong, sensational St. Louis Negro, became the new ruler of the featherweight division by halting Petey Sarron of Birmingham, Ala., although the International Boxing Union regards Al Brown of Panama as the titleholder. Pound-for-pound, Armstrong is looked upon by many as the greatest fighter in the world. Benny Lynch, ring midget from Glasgow, won the flyweight crown by virtue of a victory over Small Montana in London on Jan. 19. Lynch, on Oct. 13, retained the honours while knocking out Peter Kane in a bout in Glasgow. John Henry Lewis continued to rule the light-heavyweights, having to his credit an eight-round knockout triumph at the expense of Bob Olin of New York, a former champion, in St. Louis on June 4.

Amateur boxing was extremely active as well as highly profitable and popular in the United States in 1937. A team of Italians came from Europe to vanquish an American squad in the Yankee stadium in New York on June 9 before a record crowd of 55,000 devotees.

While the unusual activities of the heavyweight champions dominated the year much could be said for the thousands of non-title frays, which added untold interest to the sport throughout the world. Most credit for the rejuvenation of the game, however, has been awarded to Louis. Should the heavyweight king live up to his reputation as a "fighting champion" the sport is certain to continue booming.

In the field of eligibles are such proven ring warriors as Schmeling, Farr, Max Baer, Nathan Mann, Tony Galento, and Bob Pastor. (J. P. D.)

The most remarkable feature of the progress of the ring abroad in 1937 was the increasing popularity of amateur contests. Germany and the Scandinavian countries take the lead here, and both in quantity and quality their amateurs show a marked advance. In a much less degree the same thing has been happening in France and Italy, though boxing for boxing's sake does not appeal to the practical Latin intelligence. In the year under survey, selected teams of British boxers visited foreign countries, and found themselves opposed by skilful exponents, many of whom reached the standard of the A.B.A. championships. Return visits by these friendly enemies invariably resulted in crowd-compelling contests fought out in a sporting spirit. The meeting in London between picked representatives of Great Britain and Germany was particularly exciting. It illustrated the advisability of having a neutral referee in these international affairs, which are very successful, not only from the boxing, but also from the box-office point of view. (E. B. O.)

**Boy Scouts.** *Boy Scouts of America.*—The year 1937 was outstanding. There was an actual increase in membership of 59,990 bringing the grand total membership up to 1,129,827 (Dec. 31, 1937). In Cubbing, the program for younger boys, there was a gain of 31%. During the year 1,600,000 boys and men participated in the Scout program. About 500,000 boys went to camp. These boys live in every section of the United States.

The high point of 1937 was the National Jamboree held in Washington. At the President's invitation 27,232 boys and men participated, representing 536 Councils located in all parts of the country. Following the National Jamboree the Fifth World Jamboree was held in Holland. Eight hundred and fourteen American boys and men attended.

New publications during the year included a new *Handbook for Scoutmasters* in two volumes, *National and World Jamborees in Pictures*, *Scouting Marches On*, and many pamphlets of a technical nature. The 27th meeting of the National Council was held in connection with the jamboree in Washington. All the activities of the Boy Scouts of America showed a healthy increase. Many more scouts enrolled in the Senior program for older scouts and

Left to right. THREE BRITISH SEA SCOUTS, a Texas Scout in cowboy costume, a Chinese Scout from Nanking, and an Oklahoma Scout in Indian ceremonial dress at first National Boy Scout Jamboree in Washington, D.C.

especially in sea scouting. There was a marked development in scouting in rural areas. (J. E. W.)

**British Empire.**—In British Empire the members of the Association numbered 1,055,551, an increase over the previous year of 43,615. Throughout the world, the number of scouts recognized by the International Bureau was 2,855,689, an increase of 262,857 over the figures for 1936.

The outstanding event of the year was the Fifth World Jamboree, held at Vogelenzang, Holland, in August, when 28,000 scouts from 32 different countries lived together in camp for a fortnight interchanging scout ideas and customs and forming valuable friendships. The jamboree was opened by the Queen of the Netherlands, and the chief scout was present. The British contingent, under Lord Somers, numbered 8,164—the largest group of boys ever transported overseas. During the earlier part of the year, the chief scout attended an All-India Scout Jamboree at Delhi; and in July 55 British scouts visited the National Jamboree of the Boy Scouts of America at Washington.

The Sea Scout branch acquired a romantic headquarters when the Government of the Falkland islands handed over to the Boy Scouts Association the Royal research ship "Discovery." Moored in the Thames near the Temple Steps, the "Discovery" will be kept as an interesting permanent memorial to Captain Scott and other Antarctic heroes. (E. K. W.)

**Brazil,** a republic in eastern South America and largest country in the Western Hemisphere; language, Portuguese; capital, Rio de Janeiro; president, Getulio Vargas.

**Area and Population.**—The area is 3,291,416 sq.mi., approximately a quarter million greater than that of the continental United States excluding Alaska. The population was 30,635,605 (latest census 1920); (official estimate 1936) 42,395,151. The southern part of the country is dominantly white, with a large admixture of Italian blood, estimated as high as 35% for the whole country, and of German. The northern portion, especially around Bahia, is largely negro, with Indian elements in the Amazon basin. The principal cities (with estimated populations) are: Rio de Janeiro, 1,756,080; São Paulo, 1,167,862; Recife (Pernambuco), 491,078; São Salvador (Bahia), 369,692; Porto Alegre, 336,504; Belém (Pará), 298,340; Belo Horizonte, 180,241.

**History.**—Brazil comprises 20 States, one territory, and a Federal district. Until the sweeping changes effected in November

1937, the States had extensive autonomy, although the Federal Government possessed a frequently-exercised right of intervention in State affairs.

At the beginning of the year the country was still under a "state of war" (a modified martial law) following the unsuccessful so-called "communist revolution" of November 1935. Hundreds of participants in that outbreak were still in jail, and were not released until July. It was generally expected that President Vargas would seek to effect the election of a Vargas supporter to succeed when his constitutional term expired in 1938, and considerable opposition was manifested. Early in the year, Flores da Cunha, governor of Vargas's own State of Rio Grande do Sul, and one-time principal lieutenant of the president, loomed as a probable opposition candidate, and a new revolution, under his leadership, was freely predicted. He was unable, however, to command nation-wide support, and joined instead in a coalition of anti-Government and non-Fascist groups who named Dr. Armando de Salles Oliveira as their choice.

In May political lines began to be drawn more clearly. The Integralistas, the Brazilian Fascist party, conducted a "plebiscite" to select a presidential candidate and nominated their party leader, Plinio Salgado. On May 25, Dr. José Américo de Almeida was nominated as the Government party candidate. In June the Government suddenly decreed the termination of the "state of war" and lifted the censorship in effect since 1935. President Vargas then promised opposition groups "full liberty of action." A vigorous political campaign was soon under way, with candidates making extensive use of the radio. Early in August, press rumours of a new declaration of a "state of war" were denied by the Government.

In September, President Vargas signed a bill authorizing a 500,000 conto loan to the National Coffee Department to facilitate continued coffee control. This and a proposal for a Central bank, fathered by finance minister Souza Costa after a visit to the United States, focused attention on the financial weaknesses of the country.

While the presidential campaign continued in full swing, on October 1, President Vargas suddenly proclaimed a 90-day "state of war," because of the "threats of communism." Two days earlier he informed the "Getulio National party," which had been recently founded to further his own re-election, that he would not be a candidate, and on the same day terminated a six-months

FOUR OF 26,000 BOY SCOUTS from twenty-six countries at Scout Jamboree in Washington, D.C. Left to right, the smallest Scout, a Canadian representative, a bugler from Bermuda, and kilned Scout from Scotland

Federal intervention in the State of Matto Grosso. October was full of rumours. Foreign exchange declined as a result of poor coffee prices. In mid-October, under the "state of war" provisions, military control of the anti-Government States of São Paulo and Rio Grande do Sul was removed from the hands of their respective governors. In the latter State, Governor da Cunha attempted at first to defy the order, but found support lacking and acquiesced. Stripped of power and prestige, he resigned on October 16 and left immediately for Uruguay. Three days later Federal intervention was imposed.

On November 3, the Government suddenly took drastic action on the coffee question. The previous cancerous coffee control policy, under which surpluses were burned or otherwise destroyed so as to maintain prices, was suddenly abandoned. Declaring that competitor countries had refused to agree on a quota system and that Brazil refused to be a "Santa Claus" any longer, minister of finance Souza Costa announced a new policy of open competition and a reduction of nearly 75% in the export tax. Immediate Brazilian reaction was generally favourable, but the move spread consternation throughout other coffee-producing countries. A week later, a new and more spectacular action on the part of President Vargas thoroughly eclipsed this departure from a coffee policy of over a generation.

On November 10, President Vargas suddenly, by decree, dissolved both houses of Congress, the State legislatures, and all municipal councils throughout the country and promulgated a new constitution which would place the entire control of the country under the central Government. All state and national courts were abolished, including the Supreme Court, which was replaced by a Federal Supreme Tribunal. The scheduled presidential elections were postponed indefinitely. The presidential term was increased to six years. Meanwhile, President Vargas was to continue in office until elections should be held. The new constitution followed that of 1934 in its general economic policies. A unicameral "Parliament" was substituted for the old bicameral congress. The Vargas coup at the outset was generally interpreted abroad as a definite move toward fascism, although such an intent was vigorously denied by the Government.

In the next few weeks several further steps were taken. After waiting a week to check public reactions, President Vargas issued a decree forbidding any person to hold more than one Government office, a previously common political evil. On November 27, Flag Day exercises were held in which school children publicly burned the old State flags to symbolize the unified nature of the new Brazil. By decree of December 2, existing political parties were abolished, although they were permitted to continue an emasculated existence, under new names, as societies for cultural and mutual aid, or for sporting purposes; distinguishing uniforms or other group insignia were forbidden; and army and navy officers were denied the right to join the new groups. The Integralistas (fascists) a group claiming a million membership, were especially affected by this regulation.

One problem precipitated by the new order and still unsettled at the close of the year was that of national revenue. Reduction of the coffee export tax from 45 to 12 milreis necessitated eventual substitution of some other form of revenue. Inasmuch as part of the tax went to the States, and as the States were forbidden, under the new constitution, to impose interstate export taxes, the financial question threatened to become critical for them. In general Brazilian public opinion seemed to regard the Vargas coup as cutting the Gordian Knot on the increasingly difficult coffee problem and as offering some desirable changes. Nevertheless, an undercurrent of unrest still remained. A most-favoured-nation trade agreement with Canada was made in June, and in October a treaty with Bolivia was signed. Under this last a Brazil-Bolivia

PRESIDENT GETULIO VARGAS, Brazil's dictator

railway was authorized (see below), and an agreement made whereby Brazil would share in any Bolivian surplus of petroleum.

**Trade and Communication.**—In Sept. 1937, an accord with Bolivia was made providing for construction of a railway from the State of Matto Grosso to Sucre and Cochabamba in Bolivia. In December, an international highway bridge across the Uruguay river, at Uruguayana, and connecting Brazil and Ar-

gentina was opened. In 1936, Brazil had only 34,300 kilometres of railways, but the mileage was increased by additional construction completed during 1937. The greater part of the railways are along the coastal plain. Almost half the total mileage is in the two most populous States, São Paulo and Minas Geraes. Railways focus on the many ports, where they complement the coastwise shipping lines. Shipping communications both external and coastwise, were bettered during 1937. In May, Japanese interests began the construction of new ships for eastern South American trade. Late in the year announcement was made in the United States of the transfer of ships from inter-coastal to South American service, effective in Jan. 1938. Internal air communications, too, showed general development; the Rio de Janeiro-São Paulo line proved so popular that service was doubled in June 1937. There are approximately 17,000 mi. of good motor roads.

In 1936, imports totalled \$246,717,567, 10.7% more than in 1935, chiefly from Germany (23.5%), the United States (22.1%), Argentina (16.4%), and Great Britain (11.2%). Foodstuffs, especially wheat; manufactured goods, especially machinery, iron and steel, and automobiles; and raw materials, as coal and gasoline, constituted the main imports. In the first 10 months of 1937, the total imports increased 30%, with the respective shares of the supplying countries remaining substantially the same. Expiration of the trade agreement with Germany during 1937 was expected to reduce imports from that country in 1938, however.

Exports in 1936 totalled \$320,043,320, an increase of 19.3% over 1935, and went largely to the United States (38.8%), Germany (13.2%), and Great Britain (11.9%). Coffee comprised 50.7% and cotton 21.1%. In the first 10 months of 1937 exports increased approximately 10%. With the lifting of practically all restriction on coffee exportation and reduction of the export tax, the effects on the coffee trade were uncertain.

**Agriculture, Manufacture and Mining.**—Brazil is primarily an agricultural country, although there has been a steady increase in industrialization since 1920. The economic mainstay is coffee, which has been subjected to extensive crop control and consequential economic uncertainty, due to world overproduction. Brazil produces three-fourths of the world's coffee and is second only to the Gold Coast in world production of cacao. The State of São Paulo is the coffee centre, and its port of Santos the greatest coffee shipping point of the world.

Cotton, the second most important Brazilian product, has undergone a phenomenal development, especially as an export commodity, since 1932, when it ranked 19th among exports. Over half the crop is consumed within the country, where production and manufacture are estimated to provide employment for 15%

of the working population. Other important crops and the value of their 1936 production are: corn (1,163,890 contos), oranges (381,681 contos), sugar cane (363,681 contos), beans (294,114 contos), and manioc flour (248,540 contos). The livestock industry is important, especially in Minas Geraes, Rio Grande do Sul, and Bahia, and accounts for almost 10% of the exports, in addition to taking care of domestic demands.

In 1935 there were 94,298,600 head of livestock, principally cattle in the country. Mineral production is chiefly of gold, iron, and cement. Manganese, although comprising less than 2% of the mineral production, is important as an export. Manufacturing centres especially in São Paulo, where a third of the manufactured goods of the country are produced. Resources of a forest area in excess of 1,500,000 sq.mi. are as yet only slightly developed, but already supply important commodities.

**Finance.**—The monetary unit is the milreis (value: approximately 5.6¢ U.S.), ordinarily expressed in contos of 1,000 milreis each for large transactions. The budget for 1938, as fixed by Congress before its dissolution, estimated receipts of 3,666,347 contos and expenditures of 3,579,472 contos.

**Education and Religion.**—In 1935 there were 36,661 schools with a total enrolment of 2,862,666. There are several universities and technical schools, notably the Universities of Minas Geraes, Rio Grande do Sul, and São Paulo, and the new University of Brazil, created in June 1937 to supersede the University of Rio de Janeiro. In 1935, in addition to State funds, approximately 7% of the national budget went to education. The country is predominantly Roman Catholic.

**Army and Navy.**—Military service is compulsory. The navy is second only to Argentina among Hispanic American nations. Efforts to obtain obsolete United States destroyers were made in July 1937, a naval building program including two cruisers, nine destroyers, and eight submarines was announced, and contracts for construction in Great Britain of six destroyers at a total estimated cost of \$14,400,000 were made.

**BIBLIOGRAPHY.**—*Brazil: Statistics, Resources, Possibilities* (Rio de Janeiro), 1937. (L. W. BE.)

**Bread and Bakery Products.** The following statistics give some idea of the magnitude of the industry in the United States and Great Britain:

	United States	Great Britain
Persons employed (1935) (bakery products excluding biscuits) . . . . .	186,196	106,093
Value of products . . . . .	\$1,038,718,999	£61,603,000
Cost of materials, fuel and electricity used. . . . .	\$572,726,351	£34,546,000
Persons employed (1935) (biscuits and crackers) . . . . .	28,868	40,850
Value of products . . . . .	\$181,195,092	£15,540,000

The price of bread, which fluctuates with the published prices of flour, is governed in Great Britain in the London area by the Food Council, on a recognized scale of maximum prices, and this sets a standard in many parts of the country although there are considerable variations. In January for instance the price of a 4lb. loaf was 9d., in April it was 9½d., and in September 8½d. and 9d., while the average retail price of bread per lb. in the United States in 1937 was 8.9 cents (8.8 cents in 1929).

(A. E. Wt.)

**Brewing and Beer.** As is exemplified in the table below the production of fermented malt liquor in the United States rose during 1937 by 13%. Germany is the leading importer of beer both in gallon and dollar value; the second and third places in gallon value were occupied by Japan

and Czechoslovakia, and in dollar value by the United Kingdom and the Irish Free State.

#### Production of Fermented Malt Liquor

1935	1936	1937
45,228,605	51,812,062	58,748,087 bbls.
1,394 American standard barrels are equivalent to the British barrel of 36 gallons.		

**Great Britain.**—The main features of the year 1937 in Great Britain were the continual centralization of interest in the British brewing industry and the large scale structural alteration in public-house property. There was also a further advance in the sales of bottled ales as compared with draught, the former now in some areas amounting to nearly 50% of the total beer.

In Great Britain the duty on beer now stands at 10.32 times the pre-war rate, although it is less than it was in 1931. Brewers regard 1929, the last year in which duty was 80/- per standard barrel of 1055 degrees, as it is now, as a normal year.

#### January—October: 10 months

	Standard Barrels	%
1937 . . . . .	14,802,340	90.78
1936 . . . . .	13,854,448	84.96
1935 . . . . .	13,513,048	82.87
1929 . . . . .	16,306,538	100.0

**World Production.**—Additional firms produced canned beer, but since the problem of finding tasteless linings for beer cans has apparently been successfully solved, no notable changes were made in that direction and, with the exception of a new process of refrigeration, no other important improvements in the traditional brewing processes were introduced. Further progress has, however, been made in bottling methods and machinery while the number and variety of published papers relating to original work on brewing, show a keen realization of the value of scientific research to the industry.

#### World Production of Beer for 1936\* (Thousands of American Barrels)

United States . . . . .	56,155
Germany . . . . .	33,984
Great Britain . . . . .	23,329
France . . . . .	12,091
Belgium . . . . .	11,835
Czechoslovakia . . . . .	6,444
Russia (estimated) . . . . .	3,153
Irish Free State . . . . .	2,568
Australia (1935) . . . . .	2,403
Sweden . . . . .	2,169
Canada (1935) . . . . .	2,118

Total beer production (including all other countries) . . . . . 175,568

\*Official figures of the British "Brewers' Society."

(J. R.-MA.)

**Brick.** The revival of the building industry is increasing the demand for all types of building materials to such an extent that brick production in the United States has more

#### Brick Production in the United States (In millions)

Type of Brick	1934	1935	1936
Common . . . . .	1,098.7	1,811.3	2,966.5
Face . . . . .	305.3	472.6	848.8
Hollow . . . . .	6.1	9.1	8.4
Salt-glazed . . . . .	?	?	48.6
Vitrified . . . . .	113.8	87.3	107.1
Sand-lime . . . . .	41.4	61.8	103.2
Fireclay . . . . .	395.9	494.9	626.6
Silica . . . . .	103.5	149.6	229.3
Magnesite and Chromite . . . . .	10.6	12.1	20.4

than doubled since 1934, and preliminary reports indicate a further increase in 1937.

Production in Canada is chiefly common and face brick, with only small amounts of other types, and is mainly from imported clays; total production was 102,670 in 1934 and 116,037 in 1936, as compared with 463,923 in 1929.

(G. A. Ro.)

**Bridge, Contract:** see CONTRACT BRIDGE.

**Bridges.** In 1937 a world's record span length of 4,200ft. was achieved with the completion of the Golden Gate bridge at San Francisco, a suspension bridge with towers 746ft. high and with parallel wire cables of 36½in. diameter. The previous records were:

Year	Bridge	Location	Type	Span
1932 . . . . .	George Washington	New York	Suspension	3,500ft.
1929 . . . . .	Ambassador	Detroit	Suspension	1,850
1917 . . . . .	Quebec	Canada	Cantilever	1,800
1889 . . . . .	Forth	Scotland	Cantilever	1,700
1883 . . . . .	Brooklyn	New York	Suspension	1,595½

It took 40 years (1889 to 1929) to increase the record span length from 1700 to 1850ft.; then, in the next eight years (1929 to 1937), in two leaps, the record span length was more than doubled, from 1850 to 4200 feet.

Plans have been prepared for the proposed Narrows bridge (suspension) to span the entrance to New York harbor with a record-breaking span length of 4,620ft. A generation ago, the feasibility of a span of 3,000ft. was questioned; now bridge engineers confidently agree that suspension bridge spans as long as 10,000ft. are practically feasible.

It is significant to note that the cantilever bridge has yielded its previously claimed supremacy to the suspension type. For spans exceeding 800ft., and even for shorter spans, the suspension type is now generally adopted as preferable. Both aesthetic and economic considerations have governed this change.

The largest bridge project to date was completed in 1936, the Transbay bridge between San Francisco and Oakland, costing \$77,200,000. This has a total length of 8 miles, including (in the west crossing) two suspension bridges of 2,310ft. main span each, sharing a joint centre anchorage in deep water (foundation 222ft. deep), and (in the east crossing) a cantilever bridge of 1,400ft. main span, together with approach truss and girder spans of various lengths. This is a double deck construction for combined highway and railroad crossing. A record foundation depth of 240ft. was reached for the construction of one of the piers; novel dome-topped dredging caissons were used for the sinking of the deep foundations.

In December 1936, the Henry Hudson bridge was completed, carrying Express highway and Parkway traffic over the Harlem river at New York. This has a main span of 800ft., making it the longest plate girder arch span and the longest hingeless arch in the world. Traffic volume over this toll bridge soon proved so great that the addition of an upper deck to double the traffic capacity was immediately authorized and placed under construction (1937-38). Some 6,500,000 cars used the bridge in the first year, each paying a 10-cent toll, and it is expected that the 20-year revenue bonds will be retired and the bridge will be made free in 10 years.

Another outstanding bridge completed in 1936 is the Triborough bridge at New York. The principal features are a suspension bridge of 1,380ft. main span over the East river, and a vertical lift bridge of 310ft. main span over the Harlem river. The bridge is 113ft. wide. The total cost was \$48,000,000, and over 10,000,000 cars, each paying 25 cents toll, crossed the bridge in the first year. The Marine Parkway bridge over Rockaway Inlet at New York was completed in 1937. This has a central vertical lift of 540ft. span, with series of tapering continuous trusses forming the approaches.

The largest suspension bridge in the British Empire is the First Narrows bridge at Vancouver, B.C., under construction 1936-39. It has a main span of 1,550ft. This is a toll bridge project, financed with English capital.

## BRIDGE, CONTRACT—BRIDGES

An important international crossing is the Thousand Islands bridge, joining the United States and Canada across the St. Lawrence river, under construction 1937-38. This crossing, 7 miles long, utilizes the islands to reduce the span lengths required, so that the total cost is only \$2,800,000. The American crossing consists of a suspension bridge of 800ft. main span. The Canadian crossing includes a 750ft. suspension span, a continuous truss of two 300ft. spans, and an arch of 348ft. span.

The opening ceremonies in 1938 feature the celebration of 100 years of international peace and goodwill between the two nations now united by this new link of friendly intercourse.

A notable bridge under construction in 1937, to be completed in time for the 1939 New York World's Fair, is the Whitestone bridge spanning Long Island sound. This is a suspension bridge with a main span of 2,300ft., which will make it the fourth longest span in the world.

All of the recently or currently constructed bridges hereinabove mentioned are toll bridges, generally publicly owned and operated by bridge commissions or authorities. This has become the prevailing method of financing bridge projects, so that the user pays for them instead of adding them to the general tax burden. This has facilitated the securing of many needed bridge crossings to serve the motoring public where such facilities would otherwise have remained unattainable.

Another major work completed in 1937 is the Storstrøms bridge, built by Dorman, Long & Co. for the Danish State Railways, with two-hinged through arches of steel of 460—590—460 feet in the three central spans and with steel girder spans in the remainder of the crossing, whose total length is 10,535ft. The bridge has highway and railway side by side on its deck. In France, the La Roche-Guyon bridge, with a reinforced concrete arch span of 528ft., was built in 1937.

The longest bridges in the world are as follows:

Type	Bridge	Location	Date	Span
Suspension (Cable)	Golden Gate	San Francisco	1937	4,200ft.
" "	George Washington	New York	1932	3,500
" "	Transbay	California	1936	2,310

## British Association for Advancement of Science.

The annual meeting for 1937 was held in Nottingham (Sept. 1-8), where the fine new buildings of University college made an ideal setting. Over 2,000 members, including 50 foreign guests and other distinguished Dominion and overseas representatives, attended.

The presidential address, by Prof. Sir E. B. Poulton, F.R.S., on "The History of Evolutionary Thought as recorded in Meetings of the British Association," was a notable contribution to modern writing on evolution. In 13 sections meeting simultaneously, some 300 papers were read, and excursions were made to places of interest. Seven popular lectures were delivered in neighbouring towns by well known members.

Owing to the ever-increasing public demand for systematic presentation of subjects of scientific investigation having a direct bearing on the life of the community, the Council recently instituted a series of papers, in which the more immediate public interest would be stressed, and this series has now become well established.

At Nottingham, subjects discussed under this head were: X-ray methods and industry, the sex ratio, labour transference, physiology and the health of the individual and the community, adult education, and planning the land of Britain. Individual papers were read on noise and the nation, industrial physics, colour blindness, the informative content of education (by H. G. Wells, president of the education section), design of motor vehicles and traffic safety, State intervention in agriculture.

From time to time the association has held its annual meeting, by invitation, overseas. Its imperial scope was still further extended when, early in December, 100 members left Britain to attend the Silver Jubilee Meeting of the Indian Science Congress Association at Calcutta, and to tour India. Sir James Jeans succeeded the late Lord Rutherford as leader of the delegation and president of the Congress.

In Nov. 1936, the British Science Guild was incorporated into the British Association, which now maintains foundation lectures inaugurated by the guild. The Alexander Pedler lecture was delivered on May 3, at Leicester, by Prof. Allan Ferguson, on surface tension illustrated by motion pictures; and the Norman Lockyer lecture on Nov. 24, in London, by Dr. R. E. M. Wheeler on "Origins of Town Life in Britain." Further, in 1937 Mr. G. Radford Mather, an engineer and life member of the British Association, founded a series of lectures bearing his name to deal with science and the community. The first of these lectures was given in London in October by the late Rt. Hon. J. Ramsay MacDonald, and was his last public address.

The association has long maintained research committees dealing with a wide range of topics; 47 such committees were appointed in 1937, and grants approved by Council to aid the work of some of them amounted to £985. Of reports submitted for 1936-37, one dealt with the position of geology in schools, and made suggestions for increasing the supply of qualified geologists;

THE WORLD'S GREATEST BRIDGE, across Golden Gate strait from San Francisco to Marin county, California, was opened for traffic in June 1937, after three years in building at a cost of eleven lives and \$35,000,000. The structure, a single-deck, suspension bridge, has a main span 4,200 feet long, hung from two cables 36½ in. in diameter and suspended from steel towers 746 feet high. The total length of the bridge is 9,266 feet and it is 220 feet above the water. More remarkable than its colossal proportions, however, are the engineering methods of providing compensation against the irresistible and inevitable forces of wind and weather. In a heavy gale the bridge is so constructed it may swing as much as twenty-one feet out of line, the two huge cables may expand and lengthen and then contract as much as 16 feet under the influence of a hot sun and subsequent cooler temperatures, all without damage to the bridge or interruption of traffic. The towers may sway several feet out of the perpendicular without damage. How well the bridge may withstand earthquakes is a subject of much scientific discussion. Joseph Baermann Strauss, engineer, designed and built the bridge, which was constructed without Federal Government aid.

**Bridge, Cor** suggestions for the improvement of adult education. se, in Kent, the home of Charles Darwin from 1842 to .ntained by the association as a national memorial open lic. Recent additions have been made to the important bridge a of Darwiniana, and for the year ending June 6, 1937, were 6,148 visitors. On July 29, 40 representatives of high ar ociation française, led by M. Maurain, president, were reous re d there by the Council.

the president for the Cambridge meeting (Aug. 17-24, 1938) is t. Hon. Lord Rayleigh, F.R.S. (O. J. R. H.)

**British Columbia** covers an area of 366,255sq.mi., being equivalent in area to the United Kingdom, France, Holland, Belgium, and Denmark combined. The population of the Province (1937) is approximately 750,000. Of this population about 48,750 are orientals, 25,500 being Japanese and 23,250 being Chinese. The Japanese population of British Columbia is about 90% of the total Japanese in Canada, and is increasing with some rapidity. The Chinese are about 60% of the total in Canada, and owing to the small number of females, are increasing very slowly. About 50% of the population is concentrated in the south-western part of the Province, mainly in the cities of Vancouver, Victoria, and New Westminster.

British Columbia has been described as a "sea of mountains." There are great variations in climate. The coastal area enjoys what is known as a Mediterranean climate with mild winters and a summer temperature rarely above 80 degrees. The rainfall is heavy in winter, particularly on the West Coast of Vancouver island and on the northern coast of the Mainland. From a climatic point of view the Province is divided into belts running in a south-easterly and north-westerly direction. Rainfall varies from as low as 6.90 inches at Ashcroft to 263.87 inches on Vancouver island.

In the matter of social legislation the Province takes a lead in Canada, and in addition to protective legislation dealing with workers in industries of various kinds there has been established a Board of Industrial Relations which fixes wages and hours.

The main industries of the Province are forestry, mining, fisheries, and agriculture. Although the Province is still mainly a primary-producing area, certain manufactures have grown up arising out of the primary industries, and also a considerable amount of domestic manufacture. The value of the products of the four main industries in 1936 was: forestry, \$72,000,000; mining, \$54,000,000; agriculture, \$46,000,000; fisheries, \$16,000,000. Manufacturing industries in 1935 amounted to \$92,260,804. The Okanagan Valley in the interior of the Province is famous for its apples and other fruits, and the Fraser Valley is noted for dairy and mixed farming.

The representative of the Crown in the Province is the Hon. Eric W. Hamber, who is advised by a cabinet, which is responsible to the legislature, representing the electors of the Province. This cabinet is headed by the Premier, Hon. T. D. Pattullo, and consists of Hon. John Hart, minister of finance; Hon. Wells Gray, minister of lands; Hon. G. M. Wismer, attorney-general; Hon. F. M. MacPherson, minister of public works; Hon. G. S. Pearson, minister of mines and labour; Hon. K. C. MacDonald, minister of agriculture; and Hon. G. M. Weir, minister of education and provincial secretary. Annual sessions of the legislature are held. At the recent session of the legislature important measures were passed making provision for collective bargaining as between workers and employers, and arbitration in the case of industrial disputes. A measure was also introduced making provision for the setting up of a board to control prices of coal and petroleum products in the Province, and for the setting up of a department of trade and industry in the Province, and the creation of a bureau of eco-

CORONATION PROCESSION of King George VI leaving Westminster Abbey after the ceremony

nomics and statistics which shall be responsible for advising the Government on matters of economic importance to the Province. By agreement with the Federal Government, the Province assumed administrative jurisdiction over Yukon Territory.

In Provincial politics there are three parties, namely, Conservative, Liberal, and Canadian Commonwealth Federation (Socialist). These three parties have their counterpart in Dominion politics, although there is a distinction between the matters which fall within the functions of the two Governments. The present Government is Liberal. (W. A. C.)

THE MEMBERS OF THE IMPERIAL CONFERENCE at London. Prime Minister Neville Chamberlain is in the centre, first row

**British Guiana,** a British colony in north-eastern South America; language, English; capital, Georgetown; governor, Sir Wilfred E. F. Jackson. The area is 90,500 sq.mi.; population, 310,933 (census, 1931); (official estimate, 1936) 332,898, of which 42% were East Indians. The chief cities are: Georgetown, 66,601; New Amsterdam, 9,514. The principal developments in 1937 were the appointment, in January, of Sir Wilfred E. F. Jackson as governor, succeeding Sir G. S. S. Northcote, and the efforts to develop the colony, through establishment of a trust fund to provide capital and through stimulation of the Canadian trade. There are 79 miles of railway, 322mi. of main highways, and several navigable rivers. In 1936 imports, comprising foodstuffs, manufactured goods, and lumber, totalled \$9,448,189, largely from Great Britain (55%), Canada (14%), and other parts of the British Empire (11.5%), with 8.5% from the United States; exports, largely sugar and sugar products, bauxite, gold, with some diamonds, aggregating \$11,966,127 were to Great Britain (41.3%), Canada (38%), other parts of the Empire (7.5%), and the United States (6%). The export commodities and rice are the principal products. Sugar production provides employment, directly or indirectly, for 50% of the wage earners. Production for 1937 was adversely affected by poor weather conditions. The monetary unit is the dollar, approximately equal to the United States dollar. There were 236 primary schools (1936 enrolment, 51,077) and eight secondary schools. (L. W. BE.)

**British Honduras,** British colony in Northern Central America; language, English; capital, Belize (pop. 16,687 in 1931). Governor, Sir Alan C. Maxwell Burns. The area is 8,598sq.mi. Population (1931 census) 51,347; official estimate, 56,071 (1936). The colony has direct steamship and air connections with the outside, 25mi. of railroad and 170 miles of motor highway. Important as an intermediary in trade between parts of Yucatan and the United States, with re-exports of \$1,070,248 (1936). Total imports, 1936, aggregated \$3,272,833, from the United States, the United Kingdom, and Mexico; exports totalled \$3,485,099, almost half to the United States. Imports comprise foodstuffs, manufactured articles, and logwood and chicle for re-export. Exports are logwood, chicle, and bananas. The monetary unit is the British Honduras dollar (value, approx. \$1.00 U.S.). Total colonial revenue (1936) was \$1,597,540.35, with expenditures of \$1,388,695.82. Public debt aggregated \$1,159,489.50 (1936). Eighty-six primary schools (enrolment of 6,832 in 1936) are financed chiefly by government grants; four private secondary schools (enrolment 336) receive slight government aid. The population is over 50% Roman Catholic.

**British Legion.** An organization founded by the first Earl Haig in 1921 to foster the interests of British ex-service men; it now numbers about 123,000 members, organized in 4,301 branches, with a women's section comprising 1,689 branches; the membership increased during 1937 by 16,942. In the course of the year, grants amounting to £430,860 were made to distressed comrades, and work was found for 42,700 unemployed ex-service men. The Legion's annual Poppy Day appeal (Nov. 11), which brings it more prominently into public notice than any other of its activities and is its chief source of income, resulted in 1937 in the collection of £546,254, the average since and including 1929 being £495,085. The factory at which the poppies are produced gives employment to about 350 disabled men, for whom also a housing scheme has provided some 150 houses.

A village for tuberculous ex-service men is maintained at Preston Hall, near Aylesford, Kent, where wood graining, the manufacture of fancy goods and soap, and other activities are carried on by its population of about 650; the pensions department administers

POPPIES of various sizes being arranged for despatch from the Richmond factory for sale on Armistice Day, November 11

the Prince of Wales' British Legion Pension Fund, which provides pensions for nearly 2,000 prematurely aged ex-service men and women until they become eligible for the State old age pension.

The Officers' Association and Benevolent Department has since 1920 expended £2,539,154 in cash relief, placed 8,252 persons in employment, and assisted 4,686 children with the cost of their education, expending on this last-named branch of its work £14,923 in 1937. (See also AMERICAN LEGION.)

**British Medical Association.** The 105th annual meeting was held in Belfast in July 1937, under the presidency of Prof. R. J. Johnstone, whose address dealt with "Some thoughts on medical education." During the year the Council considered many matters relating to medical practice and the interests of individual members. In connection with the latter, steps were taken to urge committees of management of voluntary hospitals "to recognize the claim of visiting medical staffs to some share in the moneys raised for the treatment of patients other than those provided by voluntary subscription or donation." A parliamentary agent was engaged to examine all bills and report on any proposals likely to affect the interests of the medical profession. A Scottish branch of the British Medical Bureau was opened in Edinburgh. The 5th Australian Medical Conference was held at Adelaide in August, and the 10th annual meeting of the South African branch at Bloemfontein in September. (See also AMERICAN MEDICAL ASSOCIATION.)

**British Museum.** Considerable structural alterations took place in 1937. The first quadrant of the old "Iron library" to be rebuilt was completed, and a unique system of book delivery installed, with a continuous running system of elevators facilitating delivery to the appropriate floor and a system of horizontal moving bands delivering to the elevator. Air-conditioning was installed for the books, and special lights in the book-stacks were arranged to shade the workers and throw light on the books only. A system of pneumatic tubes was installed all over the library to deliver tickets for books to the appropriate floors.

The North library, closed for three years, reopened with the reading room made both lower and lighter, new desks and chairs were provided, and shadowless artificial lighting was installed.

Lord Duveen, who has undertaken part of the cost of rebuilding the old "Iron library," is also presenting a new Parthenon room to house the Elgin marbles.

THE NEWLY ARRANGED Egyptian Room in the British Museum

On the upper floor, mezzanine floors were built under the Egyptian rooms. An experiment was made with the display of Greek vases. The middle of the room, open to the public, shows a selection of fine specimens, while study series are arranged behind partitions.

The most important accession to the library was the Wise or Ashley library, consisting of 7,000 volumes of first editions of the famous English poets and dramatists, from Elizabethan times up to the present. Volumes of particular interest include: *Welth and Helth*, 1557, of which only one other copy is known; *Gammer Gurton's Needle*, 1575, the earliest English comedy of which any perfect copy exists, and a fine copy of Milton's *Comus*, 1637.

Other library accessions included an English MS. psalter of about 1360, which proves the English origin of the Egerton Genesis; an autographed MS. of Anatole France, the only autograph outside the Bibliothèque Nationale; nearly 100 original editions of works by Beethoven, Mozart, and Haydn; the Shrewsbury-Talbot archives, 2,195 documents relating to the estates of the Talbots, earls of Shrewsbury; four figure drawings by Rodin, and two by Augustus John.

Museum accessions included a pentelic head of Pan of the late fifth century B.C., bronze wine vessels of the same century, and a sixteenth-century Persian dish found near Teheran.

A special exhibition of manuscripts, printed books, prints, drawings, and medals illustrating the history of coronations in England was open from May 1 to Dec. 31. (V. R.)

**British Pacific Islands:** see PACIFIC ISLANDS, BRITISH.

**British Somaliland:** see SOMALILAND, BRITISH.

**Broadcasting.** The most important factor in American broadcasting during 1937 was the listening audience. This has continued to expand steadily. Today there are approximately 24,500,000 radio homes and 4,500,000 automobiles equipped with radios. Personal interviews and mechanical recorders show that the average set is tuned in for 5.1 hours daily, as against 4.3 in 1934. Of course this figure does not accurately represent total active listening time, since the radio is turned on in many homes merely as a steady background of sound while the housewife does her morning work or the tired husband reads his evening paper. This is an important factor to bear in mind when considering the effectiveness of radio as an educational or propaganda medium. Simple material is most easily apprehended aurally while more complicated matter is best understood visually.

The best evidence that radio is still young is the steady rise in

profits from broadcasting during the 1937 "recession." One of the major networks reported \$4,000,000 profit, which represents a 25% increase over 1936. Along with increased profits, 1937 also witnessed the widespread unionization of radio actors, announcers, producers, engineers and musicians. Whereas radio engineers in New York four years ago worked sixty hours a week for \$29, today, strongly unionized, they work a maximum of forty hours for \$65.

With more than one-half of the total broadcasting time given over to music the steady trend toward better music was symbolized on Christmas Day by the unforgettable concert of Arturo Toscanini conducting the National Broadcasting Company's Symphony Orchestra. Here was radio music at its finest. The mechanical techniques of microphone control combined with exceptional musicianship enabled some 20,000,000 Americans to hear great music better than they could have heard it in the concert hall. Until the N.B.C. Orchestra was organized the concerts of the New York Philharmonic Orchestra were the highlight of symphony broadcasts, but they are now outranked by the studio broadcasts of the special orchestra organized for Toscanini's ten radio concerts.

Musical taste has been further stimulated by the increasingly widespread use of electric recordings of classical music by independent stations. The New York station WQXR, which devotes most of its time to good music programmed in advance, has developed a tremendous following. It began as an experimental station and is now commercially licensed. By training the most simple element of musical enjoyment, recognition, radio is rapidly stimulating the appreciation of good music. Advertising executives are revising their preconceived notion that the general public has no taste for the best music.

The number and popularity of dramatic broadcasts is steadily increasing. According to figures released by the National Broadcasting Company, drama, comedy, and poetical readings comprised 17.7% of last year's radio hours. This is an increase of 4.1% over 1936. On the Columbia network there was an even greater emphasis. This chain presented the outstanding dramatic broadcast of the year, the poetical drama, *The Fall of the City*, specially written for radio by the contemporary poet, Archibald MacLeish. A satirical music drama by the modern composer Marc Blitzstein, *I've Got the Tune*, was an outstanding Columbia Workshop presentation. National Broadcasting Company gave a complete George Bernard Shaw play which was revised for radio by the author himself. WQXR presented Ibsen and Wilde plays weekly with the co-operation of the Federal Radio Theatre. Both major networks featured Shakespearean cycles but showed poor judgment in putting on these first-class performances simultaneously. This was carrying competition to a ridiculous extreme.

The political campaigns utilized radio more than ever before. Effectiveness of radio delivery is today an important factor in the life of the politician. When Supreme Court Justice Black issued the most important statement of his career he specifically selected radio to explain his position. The press has recognized the steadily increasing importance of radio as a news medium by acquiring more and more radio stations.

There is less restrictive radio censorship in the United States than in any other country. Such censorship as there is does not come from the Government, but arises either because of commercial commitments or the natural timidity of big business. At the same time experienced radio commentators are free to voice every kind of opinion and advertisers no longer hesitate to sponsor them.

The problem of combining good radio technique with worthwhile education is being faced more realistically. Although the 1937 National Conference on Radio in Education witnessed the

A NEW YORK RADIO THEATRE where large audiences may see and hear the production of a radio program

usual conflict between educators and broadcasters, the realization that good education can also be good entertainment is gaining ground. An outstanding example is George V. Denny's "Town Hall of the Air." This is a debate on current national and international problems by prominent authorities in which the audience participates with challenging questions from the floor. The always spontaneous and exciting round table discussion of the University of Chicago professors remains the best adult educational program on the air. Columbia's "American School of the Air" is the outstanding daily educational feature. In hundreds of public schools this program is required listening and it is also lively radio entertainment.

At present, 1937, thirty-eight broadcast licences are held by colleges and universities. Their history has been a long struggle due to inadequate financial support and insufficiently trained personnel. In several Mid-Western States these non-commercial stations are more popular than many of their money-making rivals. Most of them devote half their time to pure entertainment but win standing and support with well-presented educational programs. They have a great advantage in their ability to serve the special needs of local areas and to implement broadcasts with printed material, listener groups, or classroom instruction.

The Federal Government has entered the field of radio education with many worth-while programs sponsored by the Office of Education. "Let Freedom Ring," which dramatized the history of civil liberties in this country, had the particular merit of presenting the liberal point of view on such issues as child labour and racial intolerance. Another program, entitled "Brave New Worlds," related the history of Latin America in dramatic form. There is maintained in Washington a script exchange bureau which has distributed thousands of manuals and suggestions on educational broadcasting techniques.

In the short-wave sphere, the Boston station WIXAI, has enabled the whole world to hear Harvard university lectures. The Federal Communications Commission is now considering the advisability of reserving a portion of the short-wave band exclusively for educational purposes. The technical improvements in receiving sets have made it possible for everyone to hear broadcasts from the rest of the world. This has created some concern about the effect of the Communist or Fascist propaganda which Russia, Italy, and Germany are now directing to the United States. American short-wave stations are also devoting more attention to programs specifically adapted to the needs of foreign listeners.

Television is still "around the corner" and may stay there for another five years. Before television sets find general sale or acceptance the obstacles of expense and technical improvements must be met. Radio makes its money from advertising and it is questionable whether advertisers think enough of the television medium to spend the vast sums required for television broadcasting.

Improvements are being made both in reception and transmission, but much remains to be done. In regular radio broadcasting and reception technical improvements continue. The past year has brought greater transmission efficiency. Short-wave broadcasting from remote pick-ups has been perfected.

Radio has had an eventful year. Progress has been made along all of its many fronts. New problems have arisen that 1938 will have to solve—development will never lag while the two purposes of American broadcasting, to serve "public convenience, interest, and necessity" and to make money, move along together.

(H. V. K.)

**Great Britain.**—Nothing stands still in broadcasting, and this fact is as amply borne out in the history of European broadcasting during 1937 as in that of earlier years. Rapid growth of the

listening public, increasing use of the short-wave band for long-distance transmissions, and the advent of television, have, among other factors, concurred to accelerate developments of all kinds and to put fresh problems for the world's broadcasting amateurs and experts to solve.

British broadcasting entered on a fresh decade of its existence in Jan. 1937 with a new charter and licence granted to the British Broadcasting Corporation by Parliament after consideration of the Ullswater Committee's report. Under this charter, the B.B.C. was expressly charged with responsibility for the Empire and television services.

The distribution of programs in various parts of the country greatly improved in 1937 by the separation of the Welsh and the West of England services, the establishment of a new transmitting station in Anglesey to serve North Wales, and of a new high-power transmitter at Stagshaw to serve the north-east of England. A review of the year's programs broadcast through the National and Regional services demonstrates the rich array of the British people's culture and interests, and gives proof of the extent to which modern broadcasting reflects the current events of the day. Foremost among the year's programs was the broadcast of King George VI's coronation, marking as it did the first occasion in history when the crowning of a British monarch has been carried beyond the confines of Westminster Abbey into all parts of the kingdom and the Empire. The subsequent royal visits to Scotland, Wales, and Northern Ireland were recorded in the B.B.C.'s programs, as was also the Naval Review at Spithead. Important events in the civic, industrial, and commercial spheres continued to find expression through the various wavelengths. The microphone brought sporting interests into the listener's home with commentaries on the *England v. New Zealand* test matches, the draws for the fourth round of the Football Association Cup, the draw for the Davis Cup, and a wide array of events among other sports and pastimes.

Music continues to bulk large in British broadcast fare. As in all fields of its activities as a national institution, but more especially in this, the B.B.C.'s dual position of providing its listeners with suitable programs and of acting at the same time as a patron of the arts, becomes more apparent with each year. British broadcasting in 1937 maintained on a permanent contract basis more than 400 orchestral musicians in its Symphony Orchestra and its various other orchestras in London and the provinces, and gave engagements to thousands of artists. Its contribution to the London concert world included the provision of the summer Promenade Concerts, the B.B.C. Symphony Concerts during the winter season, and the London Music Festival, for the last named of which it secured the return to England, after an absence of two years, of Toscanini. The B.B.C. lent its support, financially and by way of broadcasting, to the leading orchestral and choral societies, both in London and the provinces, and also to the Royal Covent Garden Opera season.

During 1937, dramatic productions in the studios showed a considerable development of "feature programs," dealing with such subjects as the history of journalism, the early days of the steamship, Hadrian's Wall, the anti-slavery movement, the Sheffield steel industry, and the Duchy of Cornwall. There was also a marked increase in the number of plays specially written for broadcasting. Light music and variety, both from B.B.C. studios and from cinemas and music halls, figured prominently in the programs, the most notable event in the variety broadcasts being the Royal Command Performance. Talks and discussions covered topics and subjects of every conceivable kind, but paid particular attention to events and movements of the day; in this sphere especially, broadcasting lent its support to the Government's Health Campaign. In addition to the religious services broadcast

on Sundays and weekdays, a special series of talks leading up to the Oxford Conference on "Faith and Order" and the Edinburgh Conference on "Christian Life and Work" was broadcast. In different spheres of radio productions, the advantages of the recording processes now available became increasingly apparent. Mobile recording vans with a new method of editing records made it possible to broadcast composite sound records of events only a few minutes after their occurrence.

The value of the wireless medium as an asset to charitable and social causes can be gauged by the fact that broadcast appeals in 1937 resulted in the subscription by listeners of a total sum approximating £150,000 to charitable institutions. Appeals broad-

cast in the Children's Hour for children's charities brought in further sums totalling more than £3,000. S.O.S. and police messages broadcast from all transmitters during the year reached a total of 1,213. Messages transmitted in connection with illness registered a success exceeding 57%; police messages calling for witnesses of accidents, 38%; in relation to crime 23%, and for other special purposes approximately 37%.

The increasingly important part that wireless is playing in education is shown by the fact that at the end of 1937 the number of schools in which sets had been installed to receive school broadcasts had increased, from the 1936 figure of 5,750 to 7,751. In the field of adult education, the discussion group movement, sponsored

by a new Central Committee for group listening, continued to register newcomers.

In 1937 the B.B.C.'s Empire service completed its fifth year of operation. The daily schedule of transmissions embodied minor modifications, which raised the aggregate hours of transmission to about 18 a day. There was a marked increase in the rebroadcasting of the Empire programs from local stations and also in their distribution over the live network of wireless exchanges. Television made some important advances during the year, and at the end of 1937 the London television service still remained as the only public service of television in the world to reach viewers in their homes. (See also TELEVISION.)

**Europe.**—Turning to Europe generally, the influence of broadcasting, internationally and socially, is growing steadily. Statistics relating to numbers of listeners show that at the end of 1937 Denmark still led the field, in so far as wireless licences per head of population were concerned, with 704,062 licences (population 3,706,349). In sheer numbers of registered listening sets, the seven leading countries were:

Germany .....	9,087,454
Great Britain .....	8,479,500
France .....	4,163,692
Sweden .....	1,041,737
Belgium .....	1,008,169
Poland .....	861,256
Italy .....	795,000

The various problems of the congestion of European wavelengths continued to confront the broadcasting authorities of all countries during 1937, and it is to be hoped that successful measures of solution may emerge from the International Telecommunications Conference held in Cairo in Feb. 1938. The Lucerne Plan, drawn up by the European Broadcasting Convention in 1933, has had a large measure of success in the regulation of the medium-wave band through the synchronization of stations; in the long-wave band it has been less successful owing to the number of countries demanding a long-wave, and a lack of general acceptance of the plan because of the reduced separation entailed between stations. Moreover, whereas until recent years there was no congestion of the short wavelengths (a problem not dealt with in the Lucerne Plan), these are now being used to such an extent for broadcasting that the problem of mutual interference is becoming rapidly more serious. In fact, all the principal European broadcasting organizations expanded their short-wave services in 1937 more especially with a view to the extension of foreign language transmissions. The latest country to embark on such a service was Great Britain, which started transmissions in Arabic on Jan. 3, 1938. There was a notable increase of co-operation between the various European broadcasting organizations in regard to the interchange of programs and commentaries on important events. Among events that thus secured almost European-wide broadcasts were: the "New Year Greeting to all the World," collected from many European countries and redistributed through Berlin; Princess Juliana's wedding; the coronation ceremony and celebrations; the King of Denmark's silver jubilee, and the funerals of Signor Marconi and President Masaryk. There was also a considerable interchange of musical programs. (See also ADVERTISING; AIRPORTS; *Safety*; RADIO, SCIENTIFIC DEVELOPMENTS OF; TELEVISION.) (J. C. W. R.)

**Brown Shirts,** the first semi-military organization formed by Hitler and Capt. Röhm from the remnants of secret military groups that continued to make war and practise murder against Germany's enemies months after the Kaiser's downfall in 1918. Their purpose is to spread the doctrines and

promote the power of the Nazi Party. They were named from the inexpensive brown shirt which was the most characteristic part of their uniform. They are generally known in Germany as "SA," i.e., *Sturm-Abteilungen* or Storm Troops. They probably numbered more than two million at one time, but were greatly reduced in power and numbers when Röhm was executed in the Blood Purge of June 30, 1934, and are now commanded by Viktor Lutze. Much more important at present are the "Black Shirts," first organized in 1926 from among Brown Shirts who were picked for their physical strength and political reliability. They are known as the "SS," i.e., *Schutz-Staffeln* or Élite Hitler Protective Guard, now under the command of Heinrich Himmler. (See BLACKSHIRTS; GERMANY; NATIONAL SOCIALISM; NAZIS.)

(S. B. F.)

**Brunei,** small sultanate in N.W. Borneo (*q.v.*), under British protection since 1888, administered since 1906 by a British resident. Area *c.* 2,500 sq.mi.; chief town, Brunei (pop. 10,500); population about 34,000, including 60 Europeans. The interior is mainly jungle; timber, oil, natural gas, cutch (mangrove extract), and rubber are produced and exported. There is communication with Labuan by wireless and by regular steamer. Revenue and expenditure in 1935 were £94,900 and £91,700 respectively; imports were valued at £281,800 and exports at £432,800.

**Brussels,** capital of Belgium, as of Brabant province, on the Senne, 25mi. from Antwerp (ship-canal connection and large docks), 165 from Paris and 200 from London. Area (1921 delimitation): 12.7 sq.mi.; pop. (1936): 1,258,191—city only, 195,268. Greater Brussels is divided into 15 communes—most central: Schaerbeek (123,612), St. Josse-ten-Noode (30,001), Etterbeek (47,846), Ixelles (86,306), St. Gilles (63,140), Anderlecht (87,145), Molenbeek-St. Jean (65,551), Koekelberg (14,521). There are three main railway stations, an airport (Haeren, 4 miles N.N.E.), and broadcasting station. Brussels, more administrative and cultural than commercial, has many wealthy residents. The final conference of Oslo Powers (*see* Norway) ended April 17; that on Far-Eastern hostilities (Nov. 3–24) remained conclusive. Royal visitors included Kings Gustaf of Sweden (February; State) and Carol of Rumania (July; private). At Zellick military aerodrome (May) fire destroyed Professor Piccard's stratosphere balloon. (H. Fw.)

**Bryn Mawr College,** a United States women's college located at Bryn Mawr, Pa., had an enrolment of 534 and a faculty of 85 for its 1937–38 session. Following its fiftieth anniversary celebration in 1935, Bryn Mawr college started a new building program. During 1937 a new science building and a new dormitory were begun and plans were being completed for a wing to the library to house the Art and Archaeology Departments when the funds were in hand. These new buildings will provide facilities for an extensive academic program combining formal course work with independent and tutorial work. The honours system of independent study and the establishment in 1937 of a final examination for all Bachelors of Arts paved the way for this reorganization of undergraduate courses. Recognition of an Independent Unit of Work, equivalent to work in one graduate seminary, as credit toward the Ph.D. degree, and a similar revision of the M.A. requirements in 1937 influenced the graduate curriculum. The greatest stimulus, however, was Bryn Mawr's plan for the co-ordination of the teaching of sciences. This new science curriculum integrated the work of the biology, physics, geology, chemistry and mathematics departments and promoted study in the fruitful borderline research fields such

as geophysics, biophysics, biochemistry. The plan, which was in partial use during 1937, will apply to all advanced work in the science departments when the Science building is completed in 1938. (M. E. PA.)

**Buckwheat.** The production of buckwheat in the United States in 1937 was estimated by the Department of Agriculture as eight per cent larger than 1936. The crop in 1937 was 6,777,000 bushels. In 1936 production was 6,285,000 bushels. The crop in 1937 was 18 per cent smaller than the average five-year (1928-32) production of 8,277,000 bushels. The acreage of 427,000 acres harvested in 1937 was 14% larger than the harvested acreage of 1936, which totalled 375,000 acres, but less than the five-year average of 568,000 acres.

In New York and Pennsylvania, the two leading States in production, the 1937 crop in each case was estimated at approximately 2,250,000 bushels. In New York, however, the 1937 yield was about 200,000 bushels larger than the 1936 crop, while in Pennsylvania it was about 200,000 bushels under the 1936 production. The larger part of the increase in the 1937 acreage over 1936 was chiefly in these two States. Yields were below average in 1937 in Minnesota and the adjoining States and in most other States the yield was only an average crop or slightly higher.

The yield of buckwheat per acre in the United States in 1937 was estimated at 15.9 bushels. In 1936 the yield was 16.8 bushels to the acre. The ten-year average of the Department of Agriculture (1923-32) was 15.7 bushels. (S. O. R.)

**Budapest,** the capital and largest city of Hungary. Pop. (1936) 1,051,804; including Greater Budapest, nearly 1,500,000. Budapest, and in particular its western half, Buda, has grown rapidly of recent years. Its watering-places, and its attractions as a tourist centre, have developed greatly. Its municipal autonomy was slightly curtailed in 1935, but remains extensive. A large program of temporary housing is planned for the forthcoming Eucharistic Congress.

**Buddhism.** During 1937 Buddhist missions continued their work in Great Britain, the United States, and continental Europe, and in India some progress was made with the construction of a temple at New Delhi, the foundation-stone of which was laid in 1936. The annual commemoration of the Buddha's Enlightenment ("Wesak") was celebrated in London at a meeting presided over by Dr. Ba Maw, Burmese chief minister, and at the end of May a Buddhist opera, *Prince Siddartha*, by Count Axel Wachtmeister, was performed several times at the New Scala theatre. From June 16 to 18 a Second International Buddhist Congress took place in Paris, under the presidency of M. Masson-Oursel, of the Ecole des Hautes Etudes, attended by representatives from China, Japan, and Cambodia. It was announced during the year that a Buddhist temple is to be constructed at Los Angeles, Calif. Search for the new incarnation of the Dalai Lama, the spiritual head of Tibetan Buddhism, who died in 1934, was continued, but certain success has not yet been reported. On Nov. 30, the Tashi Lama (*see* TIBET) died in exile in Western China.

**Budget.** The American budget system was established by the Budget and Accounting Act of 1921, which directs the President of the United States to submit to Congress, on the first day of each regular session, a statement of the actual or expected financial condition of the Treasury and amounts of revenues and expenditures for the preceding, current, and ensuing fiscal years, together with a statement of financial policy for the latter year.

On September 15 of each year estimates of departmental expend-

itures for the ensuing fiscal year are submitted to the Bureau of the Budget. The period between this date and submission by the President of the budget to Congress is devoted by the bureau to adjustment of the estimates to accord with expenditure requirements, expected revenues, and the Presidential program, and to the preparation of the budget document.

Upon submission to Congress the budget estimates of appropriations are reviewed by the House and Senate appropriation committees, reported to both Houses for consideration, and enacted with such changes from the budget estimates as Congress may desire. The appropriations are made directly to the departments and are subject to an apportionment by the director of the Bureau of the Budget at the beginning of the fiscal year of the amounts that may be spent during each month or other portion of the year. Another check upon expenditures is provided by the final audit of the general accounting office.

New legislation or other events subsequent to the submission of the budget estimates may cause greater expenditures than estimated, which are provided for by deficiency or supplemental appropriations. Shortly after the adjournment of each regular session of Congress, it is customary for the President to make a summary statement of the condition of the budget for the current year on the basis of revised estimates of revenue and expenditure.

**1938 Appropriations for Governmental Departments and Agencies  
as shown in the 1939 Budget Statements**

Legislative Establishment . . . . .	\$ 24,355,975.78
Executive Office and Independent Establishments:	
Executive Office . . . . .	\$ 511,478.00
Civilian Conservation Corps . . . . .	350,000,000.00
Civil Service Commission . . . . .	75,502,000.00
Railroad Retirement Board . . . . .	144,310,077.00
Social Security Board . . . . .	258,740,678.00
Veterans' Administration . . . . .	585,832,000.00
Other Independent Establishments . . . . .	119,715,087.00
Total, Executive Office and Independent Establishments . . . . .	\$1,534,611,320.00
Departments:	
Department of Agriculture:	
Agriculture proper . . . . .	\$129,750,273.00
Agricultural Adjustment Program . . . . .	608,325,766.00
Farm Tenancy Act . . . . .	20,000,000.00
Public Highways . . . . .	180,400,000.00
Total, Department of Agriculture . . . . .	\$938,476,039.00
Department of Commerce . . . . .	\$ 43,388,342.00
Department of the Interior . . . . .	147,048,536.10
Department of Justice . . . . .	41,012,765.00
Department of Labor . . . . .	23,681,920.00
Navy Department . . . . .	526,554,179.00
Post Office Department . . . . .	784,748,053.00
Department of State . . . . .	19,340,713.34
Treasury Department:	
Treasury Department proper . . . . .	257,180,797.94
Payments to Federal land banks . . . . .	40,000,000.00
Interest on the Public Debt . . . . .	927,000,000.00
Public Debt Retirements . . . . .	579,725,000.00
Old-age reserve account . . . . .	385,000,000.00
Total, Treasury Department . . . . .	\$2,188,905,797.94
War Department:	
Military . . . . .	\$415,781,004.00
Nonmilitary . . . . .	183,157,847.00
Panama Canal . . . . .	10,573,760.00
Total, War Department . . . . .	\$609,512,611.00
District of Columbia . . . . .	\$48,285,141.00
Total appropriations . . . . .	\$6,929,921,393.16
Deduct amounts payable from:	
Postal revenues . . . . .	\$752,500,000.00
District of Columbia revenues . . . . .	43,285,141.00
Total payable from general fund . . . . .	\$6,134,136,252.16
Relief . . . . .	1,500,000,000.00
Grand Total payable from general fund . . . . .	\$7,634,136,252.16

Note: The above appropriations include reappropriations of unexpended balances of prior years and exclude 1938 appropriations made available in 1939. (D. W. B.)

**Great Britain.**—The national accounts for the year ended March 31, 1937, showed a deficit of £5,597,000 in place of an estimated surplus of £484,000. Income tax, surtax, and estate and inheritance duties had failed by an aggregate of £5,733,000 to reach expectations. This was offset by excess yields of £2,140,000 in stamp duties and of £3,757,000 on customs, but the total shortfall of revenue was a little over £1,000,000. On the expenditure side, the defence services cost £7,821,000 more than had been estimated, although the budget had provided £20,000,000 for supplementary defence votes. There was, however, a saving of £3,143,000 on the civil votes (including supplementaries), and the fixed debt charge yielded £13,127,000 for the redemption of debt. (Under the fixed debt charge, any saving on interest and management of the national debt was automatically transferred to sinking fund.) Hence, although expenditure totalled £830,313,000, excluding the self-balancing post office account, against revenue of only £824,716,000, there was a true net surplus of £7,530,000.

Mr. Neville Chamberlain, opening his budget on April 20, estimated ordinary revenue for 1937-38, on the existing basis of taxation, at £847,950,000, an increase of £23,234,000 over receipts in the previous year. He expected to obtain £22,223,000 more from income tax and surtax, £1,010,000 more from estate duties, and £12,218,000 more from customs and excise, but there would be a drop of £13,600,000 in miscellaneous (non-tax) receipts. The fixed debt charge was kept at £224,000,000. The civil votes (including £10,000,000 provided for eventual supplementary votes) showed an increase of £20,046,000 over issues in 1936-37, the defence votes an increase of £12,196,000. In addition, expenditure totalling £80,000,000 would be met by a special defence loan. Mr. Chamberlain had already taken power to borrow £400,000,000 for rearmament over five years, and a loan of £100,000,-

000 was issued a week after the budget. The total increase of expenditure was placed at £32,535,000, and a prospective deficit of £14,898,000 had therefore to be made good.

Minor adjustments of taxation included measures to restrict legal evasion of income tax, changes in customs duties to implement the Anglo-Canadian trade agreement, and the abolition of the male servants licence duty.

The major source of additional revenue in 1937-38 would be the increase of the standard rate of income tax from 4s. 9d. to 5s. in the pound. This would yield £13,000,000 in the current year and £15,000,000 in a full year. The Chancellor finally announced the imposition of a new tax on the growth of company profits, to be known as the National Defence Contribution (*q.v.*). This would yield only £2,000,000 in 1937-38. The budget was therefore balanced with revenue estimated at £863,100,000 and expenditure at £862,800,000, excluding the self-balancing post office account and the borrowing for defence. (*See also UNITED STATES: Recession, 1937.*)

(H. V. H.)

**Buenos Aires,** capital of Argentina, located on the Rio de la Plata; mayor (*intendente municipal*), Mariano Vedia y Mitre. The area is 115 sq.mi.; population (official estimate, 1935) 2,388,645, making it not only the largest city south of the equator, but the world's second Latin city and the third largest city in America as well. With its suburbs, it has approximately 3,500,000 population. The city is co-terminous with the federal district and entirely distinct from the Province of Buenos Aires. It is governed by a mayor appointed by the president of the republic, and an elected council. The year 1937 was featured by a remarkable building boom which, it was predicted, would exceed that of 1928. The most important construction begun, apart from office and apartment buildings, was a huge underground parking space beneath the city streets, which is expected materially to reduce traffic congestion. In addition, several new government buildings were begun, including a new edifice for the ministry of finance, estimated to cost 7,415,609 pesos (approx. \$2,225,000). The municipality itself was preparing a fifty-million-peso building program. Buenos Aires is the most important port in all South America. In 1936 84% of Argentine imports entered through it. (L. W. BE.)

**Building and Building Industry.** The recovery in building construction, which showed encouraging progress in 1936, started 1937 with even brighter prospects, but suffered a set-back toward the middle of the year, especially in the residential field. Its total volume will, therefore, show only a small net advance over 1936, remaining at approximately one-third of the 1929 or one-fourth of the 1925 (peak year) figure.

Building has been the industry hardest hit by the depression and the slowest to revive. Normally, its activities are divided, roughly half and half, between residential and non-residential construction. Even in 1929, when it had suffered considerable decline, it was estimated to be a nearly \$6,000,000,000 industry. In the years 1933 and 1934 it dropped almost out of sight. Only the extensive volume of non-residential public works kept the industry alive.

The failure to build new dwellings during so many years has produced a housing shortage as acute as that which followed the World War. There is general agreement that 2,000,000 new dwelling units are required besides the unfit ones which need replacing. Yet apparently the demand is not effective, or the industry has failed to interpret it correctly. Some observers believe that the present need is for rental units rather than home ownership, and all agree that the largest potential market lies among income

In the hope of hastening the recovery of this basic industry, President Roosevelt addressed a special message to Congress on Nov. 29, 1937, urging certain legislation which may prove helpful to private enterprise in residential construction. For building by public authorities, see HOUSING: *United States*.

**BIBLIOGRAPHY.**—Publications of the U. S. Bureau of Labor Statistics; Publications of the F. W. Dodge Corporation; Message of President Roosevelt to Congress, November 29, 1937; *The Housing Market*, report by the National Housing Committee, December 3, 1937. (E. E. Wo.)

**Great Britain.**—Building is one of the most diverse and competitive of industries in Great Britain, and its prosperity relies in a large measure upon intense organization, co-operation, and co-ordination in all its branches. Efforts are continually being directed towards improving the standard of technique and amenity in every building erected, while with new materials and methods of construction, collaboration with the scientist has become increasingly imperative. Education in building technology must therefore be framed to fulfill the highly specialized requirements of the numerous branches of the industry.

During 1937, activity in the industry generally maintained a high level, despite the threat that the demands of the armament program would dislocate normal trade and that there would be a shortage of steel. Happily, this anxiety was allayed by those in control and by the Government's action in controlling the price of steel. All the indications point to a steady continuance of production. Though undoubtedly there was a falling off in speculative house building in the London area, it has continued actively in other parts of the country. There is still a great deal of housing work to be accomplished in carrying out the Government's plans for dealing with slum clearance, overcrowding, and the like. As a result of the increased prosperity in national industries, commercial and industrial building has made a good showing, and the easier position with regard to steel supplies should stimulate still further work of this class.

As a result of close collaboration between the various branches of the industry and those responsible for scientific research in the production and application of new materials, mechanical ap-

**COSTS OF CONSTRUCTION** (all types): index of Associated General Contractors of America, Inc.

pliances, etc., development and speed in construction are noticeable in many directions. Reinforced concrete, although at one time still hampered by by-laws made before its general use, has now made rapid strides, to the great benefit of the cement industry. Development will be further encouraged now that the efforts of the industry to get the authorities to amend the regulations have been successful.

Steel-framed buildings continue to be in general demand on account of the rapidity with which they may be erected. Electric arc welding has been used with success in certain types of the larger buildings of this class. With the exception of certain civic buildings, the impedimenta of masonry is being discarded in favour of brick and concrete panel walls faced with stucco, or artificial stone, faience, metal, and glass veneers. On the Continent of Europe and in America, glass brick walls are being used with increasing success. By this method, unlimited light may be admitted to a building without departing from the normal standards of steel-framed construction. This is ideal for industrial buildings, and a rapid development may be expected in this form of construction, when certain technical difficulties have been overcome. Internally, glass, wood, stone, and metal veneers, in conjunction with concealed lighting, have been developed to a very high degree, and are now accepted as the normal standard of good building practice.

Architects have responded to the public's increasing demand for a living architecture, by designing elevations which are in many cases essays in architectural composition. Straightforward solutions of design problems have been produced by clever handling of contrasting masses and shapes, relieved by simple surface treatments or sparsely used detail. The proximity of modern work with its fresh and interesting expression, tends in many cases to increase the obsolescence of older buildings, and necessitates a desire for their reconstruction. Depreciation in this respect should provide the impetus for a greater volume of new work. (See also ARCHITECTURE; HOUSING.) (N. KE.)

**Bukharin, Nikolai Ivanovich** (1888— ), former Bolshevik leader, born and educated in Moscow; joined the Communist party, 1904; was exiled in 1910; escaped and joined Lenin in Austria, where they published *Pravda*, of which Bukharin was later editor in Russia (1918–28). During the War he worked with revolutionaries in Switzerland, Scandinavia, and New York; and returning to Russia after the February revolution, he assisted in the organization of the October revolution, becoming a member of the Higher Economic Council. In 1926 he succeeded Zinoviev as president of the executive committee of the Communist International; but, accused of falsifying Marxism into a scholastic sociology and sus-

pected of Trotskyist leanings, he was removed in 1928. After submission, and in spite of his opposition to the liquidation of the kulaks, he was re-admitted to the party and office in 1929; became editor of *Izvestia* in Feb. 1934, but in March 1937 he, with Rykov was expelled from the party after being found guilty of betraying the communist cause and working for the restoration of capitalism. He published a number of works on economics and theoretical communism.

**Bulb Flowers:** see HORTICULTURE: *Bulb Flowers*.

**Bulgaria,** a kingdom of south-eastern Europe and member of the League of Nations. Bounded W. by Yugoslavia, N. by Rumania, E. by the Black sea, S.E. by Turkey, S. by Greece. Ruler, King Boris III; flag, white, green, and red, flown vertically.

**Area and Population.**—The area is 39,825 sq.mi. Population (1936) 6,254,000. According to the 1926 census, 81.3% of the population were Bulgarians, 10.5% Turks, 1.9% Pomaks (Bulgarian Moslems), with Germans, Jews, Armenians, Greeks, Russians, etc. The national church is the Bulgarian Orthodox Church, to which in 1926, 4,568,773 persons belonged. There were 789,296 Moslems, 46,931 Jews, 40,347 Catholics, etc. The non-State religions enjoy wide autonomy. Education is free, compulsory, and for the most part State-controlled, although there are also private institutions. The largest towns, with their populations, are Sofia (287,976), Plovdiv (Philippopolis) (100,485), Varna (70,183), and Ruschuk (49,388).

**History.**—After a somewhat unhappy period of parliamentary government since the War, a band of officers made a *coup d'état* and dissolved parliament on May 20, 1934. The constitution was suspended, and the political parties dissolved; although the particular group forming the Government was not always the same. On July 4, 1936, M. Kiosseivanoff was appointed prime minister and minister of foreign affairs. On Oct. 21, 1937, a new electoral law was promulgated, providing for universal suffrage for both sexes (an innovation in Bulgaria). Communists, adherents of violence, State and communal functionaries, and persons without gainful occupations are excluded from the passive suffrage. No party nominations or party candidates are allowed.

A decisive step was taken along the road, entered upon some three years previously, of reconciliation with Yugoslavia by the signature, on Jan. 24, of a treaty, article 1 of which simply declared that "there will be inviolable peace and sincere and perpetual friendship between the kingdoms of Yugoslavia and Bulgaria." In fact, relations between the two countries became cordial, and the barbed-wire entanglements on the frontier were removed. The Macedonian Revolutionary Organization seemed to have lost its power. The idea of a customs union with Yugoslavia was bruited.

**Trade, Communications and Finance.**—Bulgaria is predominantly agricultural. The chief article of export is tobacco, followed by eggs, fruit, cereals, and live animals. Industrial articles are imported, as although industry is State-assisted, its development remains rudimentary. By far the most important customer and source of supply is Germany, which in 1936 supplied 1,940,000 of Bulgaria's total of 3,181,000 levas' worth of imports and took 1,800,000 out of 3,911,000 levas' worth of exports. The trade balance has been favourable since 1933. The budget was balanced in 1937 at 6,163 million levas, and in 1937 at 6,912 million levas (ordinary receipts, 6,344.5 million levas). The leva is nominally 0.7224 gold cents, but premiums are allowed, varying according to the groups of goods and the different foreign currencies.

**Defence.**—Bulgaria is still bound by the Treaty of Neuilly to

KING BORIS of Bulgaria, a devout communicant of the Greek Orthodox Church

limit her army to 20,000 of all ranks, enlisted by voluntary service. The strength of the active army in 1937 was 1,062 officers and 19,030 other ranks. See *Annuaire Statistique* (Sofia, annual). (See also BALKAN ENTENTE.) (C. A. M.)

**Burleson, Albert Sidney** (1863–1937), postmaster general under President Wilson and Texas Representative for twenty-two years, was born at San Marcos, Texas, June 7, 1863. After serving in local offices, he entered Congress in 1891 where he served until appointed to Wilson's Cabinet in 1913. During his term of office he successfully established the newly inaugurated parcel post system, exercised strict control over war time mail, and inaugurated the air mail service. He died at Austin, Texas, Nov. 24, 1937.

**Burma.** Burma lies on the eastern side of the Bay of Bengal, between India and Siam. It fills the vast basin of the Irrawaddy river, rises into the tangled mountain mass on the borders of China, and runs down along the sea in a narrow strip into the Malay peninsula; its length from one extremity to another being 1,200 miles. Burma has an area of 233,492 sq.mi., and a population of 14,667,146, of whom 84% are Buddhists. If certain hill tracts and unadministered areas are included, the total extent of the country is nearly 262,000 square miles. The capital cities of Lower and Upper Burma respectively are Rangoon (pop. 400,415) and Mandalay (pop. 147,932); with the exception of Moulmein (pop. 65,506), there is no other town of importance.

Up to 1937, Burma was a province of British India. On April 1 of that year it was separated from India and placed directly under the Crown, with a governor (Sir Archibald Cochrane) and a legislature of its own. Its constitution is incorporated in the Government of India Act of 1935.

The legislature consists of a Senate of 36 members and a House of Representatives of 132 members; and the administration is in the hands of a Council of Ministers, who are at present six,

and may not exceed ten, in number. A High Court sits at Rangoon, and there are 36 civil districts.

Owing to the ubiquitous monastic schools, the standard of literacy is far higher than in India; practically one in every two men, and one in every seven women, being able to read and write.

Of the total area, less than 12% is cultivated, but over 14% is occupied by forests. Except in a dry zone in Upper Burma, rice is grown everywhere, and irrigation is little required. Oil-seeds come a poor second; and a certain amount of cotton, tobacco, rubber, and tea are produced. Of the forest produce, teak has the lion's share, but there are many admirable timbers.

The mineral wealth of the country is considerable. Rubies, which were once actively mined, have been killed by synthetic competition; but 6,000,000oz. of silver is a normal output, and iron, copper, jade, tin, and wolfram are all met with.

Petroleum, however, which is largely brought down by pipeline to the Rangoon docks, is by far the leading export, with a normal output of 250,000,000gals. or over; and lead, found in the Northern Shan States, ordinarily yields 70,000 to 80,000 tons. Fisheries are a source of revenue, as salt fish is in the staple diet of the people. (ME.)

**Buses:** see MOTOR-BUSES.

**Business Cycles.** Any particular boom-depression sequence, or any particular country's experience, is likely to vary from the standard pattern of cyclical movement in trade, industry, and prices. Therefore, statements about the position on the business cycle reached by the world as a whole in 1937 can only be in general terms. Recovery from depression, which had been noticeable in some countries from 1932 or 1933 onwards, though delayed in others, continued into 1937, but halted before the end of the year. If the turning-point of the cycle be taken as the moment, either when rising costs overtake higher prices and larger turnover, and thus restrict the profitability of industry, or when the output of capital-goods industries begins to decline, then most of the chief industrial countries with liberal economies had passed a peak of the curve during 1937. The same is probably true of the enclosed-economy countries, though these had to some extent insulated themselves from the world cycle.

The second of the two tests is the more susceptible to statistical measurement. In the United States, the index of production of investment goods (Federal Reserve Board), after rising to a peak of 104.1 (1929=100) in Aug. 1937, fell to 94.4 in September, and continued to fall. The total of building contracts awarded fell sharply from \$321,600,000 in July to \$207,100,000 in September.

In France, the index of building activity began to decline in May, and that of steel production in August. In Great Britain, the output of iron and steel was better maintained, but the figures of new building (both private houses and commercial structures) showed a downward trend after July; and the building boom had been of outstanding importance in the earlier reflationary period.

In Germany there was no visible recession in building or in the production of investment goods before the end of 1937. Primary producing countries, such as Australia or Argentina, likewise showed little reduction of internal prosperity, though their balances of trade were sharply affected by the fall in commodity prices after April.

The course of world prices by itself would be misleading in this connection; for whereas the slump of 1929 onwards was preceded by no inflation of commodity prices, there was such an inflation in the early months of 1937, the liquidation of which would not necessarily imply a downward phase of the business cycle.

(H. V. H.)

BUSINESS ACTIVITY in the United States: *Annalist* composite monthly index

**Butler, Ellis Parker** (1869-1937), American humorist, was best known as the author of *Pigs Is Pigs*. Born in Muscatine, Iowa, Dec. 5, 1869, he began writing at an early age. After several years of clerking in the local store, he earned enough from magazine articles to come to New York. There he worked for trade journals, writing his first book on interior decorating. Most of his thirty-two productions, however, were devoted to humorous subjects. For thirty years a resident of Flushing, L.I., he served as vice-president of the Flushing National Bank, president of the Flushing Savings and Loan Association, trustee of the Flushing Hospital, and as an active participant in local Democratic politics. He was a founder and former president of the Authors' League of America and a member of the Dutch Treat Club, The City Club and the Authors' Club. His death occurred at Williamsville, Mass., Sept. 13, 1937.

**Butter.** The International trade in butter between about 25 countries on the exporting side and approximately the same number on the importing side was 1,100,342,000lbs. for the 10 months from Jan. 1 to Oct. 31, 1937, the International Institute of Agriculture reports. This compared with 1,115,494,000lbs. for the same period in 1936. The United Kingdom was by far the largest importer, 883,089,000lbs., with Germany second, and accounting for 156,368,000lbs. of butter imports in 10 months in 1937 despite governmental agitation to reduce consumption.

Denmark was the largest exporter, 283,875,000lbs., as reported by the Institute. New Zealand was second among exporters, 268,952,000lbs.; Australia third, with 130,119,000lbs.; the Netherlands fourth, with 104,903,000lbs.; Sweden fifth, with 45,217,000lbs., and the Irish Free State sixth among exporters, with 40,759,000lbs. for the 10-month period.

Although both are large producers of butter the United States and Canada are classed among importing countries, and the Institute reports 10,364,000lbs. by the U.S. and 60,000lbs. by Canada in the foregoing period. For the 12 months of 1937 U.S. production of creamery butter was 1,611,394,900lbs., as estimated by the U.S. Department of Agriculture, and comparable to 1,629,407,000lbs. in 1936. The leading producing States, were as formerly, Minnesota, Iowa, and Wisconsin. In addition there is an annual U.S. production of about 500,000,000lbs. of farm butter, which is consumed on the farm or sold in nearby communities. This is a highly conjectural estimate because there is no feasible way of checking farm butter production, the American Butter Institute points out. The Institute, which was founded in 1908 as the American Association of Creamery Butter Manufacturers, to represent the creamery butter industry, changed its name to American Butter Institute in 1937. Wholesale butter prices in the U.S. in 1937 ranged from a low average of 29.23 cents a pound in June to a high monthly average of 35.06 cents a pound in December. This was for standard butter of about 90 score in Chicago. Prices in

New York, which is farther from producing centres, were higher. Butter consumption in Canada in 1936-37 was 346,304,832lbs., the Ministry of Trade and Commerce reports. This figure approximates very closely the Canadian annual production. For the 10 months of 1937 reported above, Italy imported 4,945,000lbs. of butter; France, 1,312,000lbs.; Japan, 1,164,000 pounds. (See also CHEESE; DAIRYING.) (S. O. R.)

**Caballero, Francisco Largo** (1869- ), Spanish Labour leader and statesman, came of peasant stock and worked as a mason, but was early caught up in the trade union movement, and later became secretary of the General Union of Workers and chairman of the Spanish Socialist party. Imprisoned seven times for socialistic activities, and in 1917 sentenced to death (but afterwards released), after the revolution he was minister for Labour in Azaña's Provisional Government of 1931, holding office till 1933. In Oct. 1934 he was imprisoned on a charge of complicity in the Asturian revolt and, though the public prosecutor called for a sentence of 30 years' imprisonment, he was acquitted by the supreme court in Nov. 1935.

Disliking the coalition with the Left Republicans, Caballero resigned his chairmanship of the Socialist party in Dec. 1935, and on Sept. 4, 1936, succeeded Señor Giralt as premier at the head of a popular front ministry, which remained in office (see SPAIN) till May 15, 1937, when Caballero was forced to resign through the extremist groups—Anarcho-Socialists and the Socialist-Labour union—refusing to work longer with him. A man of marked integrity and a lifelong worker for the proletariat, Caballero, who has since supported M. Negrin owed the downfall of his ministry chiefly to his detestation of communism.

**Cabinet Members.** The following are the members of President Roosevelt's cabinet, all of whom served without change through 1937:

Post	Name	State
Secretary of State	Cordell Hull	Tennessee
Secretary of the Treasury	Henry Morgenthau, Jr.	New York
Secretary of War	Harry H. Woodring	Kansas
Attorney-General	Homer S. Cummings	Connecticut
Postmaster General	James A. Farley	New York
Secretary of the Navy	Claude A. Swanson	Virginia
Secretary of the Interior	Harold L. Ickes	Illinois
Secretary of Agriculture	Henry A. Wallace	Iowa
Secretary of Commerce	Daniel C. Roper	S. Carolina
Secretary of Labor	Frances Perkins	New York

**Great Britain.**—The cabinet of Great Britain, as reconstituted after the resignation of Mr. Baldwin in May 1937, was as follows:

- Prime Minister and First Lord of the Treasury, Mr. Neville Chamberlain;
- Lord President of the Council, Viscount Halifax;
- Chancellor of the Exchequer, Sir John Simon;
- Lord Chancellor, Viscount Hailsham;
- Secretary of State for Home Affairs, Sir Samuel Hoare;
- Secretary of State for Foreign Affairs, Mr. Anthony Eden;
- Lord Privy Seal, Earl De La Warr;
- Secretary of State for Dominion Affairs, Mr. Malcolm MacDonald;
- Secretary of State for the Colonies, Mr. W. Ormsby-Gore;
- Secretary of State for War, Mr. L. Hore-Belisha;
- Secretary of State for India and Burma, The Marquess of Zetland;
- Secretary of State for Air, Viscount Swinton;
- Secretary of State for Scotland, Mr. Walter Elliot;
- President of the Board of Trade, Mr. Oliver Stanley;
- First Lord of the Admiralty, Mr. A. Duff Cooper;
- Minister for the Co-ordination of Defence, Sir Thomas Inskip;
- Minister of Agriculture and Fisheries, Mr. W. S. Morrison;
- President of the Board of Education, Earl Stanhope;
- Minister of Health, Sir Kingsley Wood;
- Minister of Labour, Mr. Ernest Brown;
- Minister of Transport, Dr. Leslie Burgin;

The following ministers do not hold a seat in the cabinet:

- First Commissioner of Works, Sir Philip Sassoon;
- Minister of Pensions, Mr. H. Ramsbotham;
- Chancellor of the Duchy of Lancaster, Earl Winterton;
- Postmaster-General, Mr. G. C. Tryon;
- Paymaster-General, Lord Hutchison;

Attorney-General, Sir Donald Somervell;  
Solicitor-General, Sir Terence O'Connor;  
Lord Advocate, Mr. T. M. Cooper;  
Solicitor-General for Scotland, Mr. J. S. Reid.

**Cadmium.** Up to the present time no ores have ever been mined and treated for their cadmium content alone; the entire world supply is obtained as a by-product in the treatment of residues from zinc and lithopone plants, and from the fume collected in lead and copper roasting plants. No very accurate total production figures are available, since data are entirely lacking from some countries, while those from others overlap, but it is estimated that a production of about 1,000 metric tons annually a decade ago has increased to about 4,000 tons at the present time, of which the United States supplies about one-half, followed by Mexico, Canada, Belgium, Australia, and a number of smaller producers. The first large impetus toward the expansion of production came from the application of the electroplating of other metals, particularly steel, with cadmium, as a protection against corrosion; more recently a large new demand has resulted from the development of cadmium alloy bearing metals for automotive use. Since the possible supply of a by-product metal is determined not by the demand for it, but by the rate of operations on the major metals which it accompanies, the cadmium market is in the peculiar position of being faced with a large and increasing new demand, for which the metal can be obtained only by taking it away from some previous type of consumption, since the possibilities of increasing the present supply are comparatively small; as a result most of the metal used in automobile bearings has been diverted from electroplating, the former being able to stand a higher price than the latter, for which cheaper substitutes are available. (G. A. Ro.)

**Calcutta.** Calcutta is the second largest city in the British Empire, having a population, if Howrah and the suburbs are included, of 1,485,582, of whom 70% are Hindus and 25% Moslems. The capital of the Bengal presidency, it was also before 1912 the capital of British India. It is the centre of the jute manufacturing industry, and possesses one of the most important harbours in the East, although it lies 80mi. up the river Hoogly from the sea. Calcutta proper has an elected municipal corporation, with 96 members and an income of £2.8 millions; Howrah and the various suburban municipalities have separate boards. The Calcutta Corporation in 1937 decided to give preference in its appointments to qualified candidates who had been political *détenus*. The Port Trust has 20 members, an annual income of over £2,000,000, and a capital debt of £18.7 millions. (ME.)

**Calendar of Events, 1937:** see pages 1-14.

**California,** Pacific coast State of the United States, and thirty-first State to enter the Union (Sept. 9, 1850), is popularly known as "The Golden State"; area, 155,652 sq.mi., population (U.S. census, 1930) 5,677,251; Federal estimate, July 1, 1937, 6,154,000. Capital, Sacramento, 93,750. Cities larger than Sacramento (1930) were: Los Angeles, 1,238,048; San Francisco, 634,394; Oakland, 248,063; San Diego, 147,995; Long Beach, 142,032.

Of the State's population, 4,160,596 were urban, or 73.3%; 5,040,247 whites; 97,456 Japanese; 81,048 negro; 37,361 Chinese; 4,603,287 native born; 1,073,964 foreign born.

**History.**—California showed continued economic improvement during the year 1937, despite frequent and widespread labour disturbances and considerable havoc wrought upon agriculture by floods. Politically there were few significant developments. Dem-

ocrats, controlling the Assembly for the first time in forty years, carried on a campaign to harass Republican Governor Frank F. Merriam, who, with the support of the Republican Senate, effectively blocked most Democratic legislation. The more important legislative acts provided for liberalization of the old-age pension law, substitution of lethal gas for hanging as a means of capital punishment, and institution of a retirement system for judges. A judicial decision of wide interest was the State Supreme Court's denial of Thomas J. Mooney's plea for a writ of habeas corpus; thus Mooney, serving a life sentence for the San Francisco Preparedness Day bombing in 1916, was left no further recourse in the California courts.

FRANK F. MERRIAM, governor of California

In a special election, held in May, Albert J. Elliott, a Roosevelt adherent, was elected to succeed the late Henry Stubbs of Santa Maria as representative of the tenth Congressional District. An important development in municipal politics was the election of Frank L. Shaw to the Los Angeles mayoralty. Dwarfing these events in Statewide interest was the year-long San Francisco graft investigation, which resulted in the resignation of all members of the police commission and the ousting of many police officers. In State politics, Democrats and Republicans strove to consolidate their ranks for the Nov. 1938 elections, when the governorship and the office of U.S. Senator William Gibbs McAdoo will be at stake. Governor Merriam drew sharp criticism for having allegedly dictated the choice of Captain Clyde J. Plummer of Los Angeles as successor to the late Warden Clarence A. Larkin of Folsom prison, killed in an attempted prison break Sept. 19.

Extreme labour unrest, sometimes erupting into violence, severely handicapped California industry. Major strikes crippled the maritime and canning industries, and the nationwide conflict between the American Federation of Labor and the Committee for Industrial Organization had violent repercussions in California labour politics. Most protracted and costly 1937 labour disturbance was the strike of 40,000 San Francisco maritime workers, officially terminated February 5, after having tied up shipping for 98 days. Strife in the canning industry, marked in May by violence and bloodshed when Stockton canners attempted to reopen strike-bound plants, was apparently satisfactorily ended in November by an agreement involving 96 canneries and unions representing 70,000 workers. Important strikes also affected San Francisco hotels, the motion picture and automobile industries, and Southern California aircraft factories.

Interneine conflicts featured California labour developments during the latter half of the year. The most notable inter-union controversy was that between the Pacific Coast International Longshoremen's Association (a C.I.O. adherent) and the Teamsters' Union (an A.F. of L. affiliate) concerning jurisdiction over warehousemen. Both President William Green of the A.F. of L. and John L. Lewis, C.I.O. leader, actively intervened in this dispute, which affected the entire Pacific coast, although centring in San Francisco, where, in September, it threatened once more to paralyze shipping. Expulsion of C.I.O. delegates from the State Federation of Labor convention at Long Beach in September and similar purges in municipal labour councils still further reflected the national labour rift.

In sharp contrast to the pessimistic labour outlook was the progress made on various public projects. The Golden Gate bridge, containing the longest single span in the world (4,200ft.), was opened to traffic May 27 and 28. Building construction went ahead rapidly on the man-made island site for San Francisco's Golden Gate International Exposition, to be held in 1939. Actual work was begun in October on the \$170,000,000 Central Valley Project, a vast plan for conserving and utilizing water resources of the Sacramento and San Joaquin rivers. (See also BRIDGES.)

**Education.**—In education, California maintained its high position. The University of California continued to be rated with Harvard and Columbia as one of the country's leading universities. Attaining a record enrolment of 22,955 for the 1937 fall semester, the University will receive more than \$15,000,000 from the State in 1937-39. The well-developed public school system buttressing the university was allotted more than \$72,000,000.

**Charities.**—Relief problems were substantially increased in 1937, especially in Southern California and the San Joaquin valley, by the influx of unemployed from other States. The 1937 legislature appropriated \$48,000,000 for unemployment relief, and, in the first eleven months of 1937, the State Department of Social Welfare distributed nearly \$34,000,000 to needy aged and blind, and to needy children.

**Finance and Banking.**—California's budget for 1937-39, largest in the State's history, totalled \$531,847,391, including special appropriations and Federal contributions. Estimated income exceeds this figure by nearly \$14,000,000, however, and increasing revenues, resulting from improved business conditions rather than higher tax rates, were expected rapidly to wipe out the deficit of \$17,756,801 as of June 30. Bank debits for 1937 were estimated at \$29,200,000,000, nearly \$2,000,000,000 greater than in 1936. On June 30, 1936 there were 267 banks (145 State, 122 national) with a capital of \$216,511,000, deposits of \$3,814,794,000, and total resources of \$4,282,460,000.

**Agriculture, Manufactures.**—The year 1937 was one of general business prosperity. Production reached approximately \$2,300,000,000 as compared with \$2,133,000,000 in 1936 and \$1,362,000,000 in 1933. Of this, manufacturing contributed approximately 43.5% (value added), agriculture 29.3%, mining 16.1%, motion pictures 7.8% (cost of production), lumbering 2.3%, and fisheries 1.0%. A minimum of rural labour disturbances, higher prices, and increased sales boosted the farm income to \$660,232,000, a 7% increase over 1936. Manufacturing, accelerating rapidly during the first three quarters of 1937 but slackening during the last quarter, showed increases of 7% in employment and 18% in total payroll. Foreign trade increased sharply in 1937. Exports for the first ten months reached \$229,289,950

CHINESE AND JAPANESE POPULATION in the United States, showing number in California (lower part of each column) and number in the rest of the country (upper part)

(compared to \$176,227,591 in 1936); imports aggregated \$148,531,303 (compared to \$131,116,035 in 1936).

In sports California continued outstanding. The State was foremost in developing major league ballplayers, of whom Joe DiMaggio was the leading example. Donald Budge was the country's top-ranking tennis player. In football, the University of California team, one of the strongest in the country, won the Pacific Coast Conference title and defeated Alabama in the Pasadena Rose Bowl on New Year's Day, 1938.

(C. E. CH.; R. H. SH.)

## California, University of.

The State university of California with its main headquarters at Berkeley, San Francisco and Los Angeles, had the largest full-time enrolment of any United States college at the opening of the year 1937-38. Its 22,955 students were supplemented by 3,968 part-time students, while its staff of 1,813 ranked fourth in the country behind Columbia, Harvard and New York universities. There were approximately 1,300,000 volumes in its library, placing it fourth after Harvard, Yale and Columbia. Its endowment stood at \$26,834,827 with cash gifts for the fiscal year 1936-37 valued at \$732,266. Leading events of 1937 were the discovery of bones of an early California race by university anthropologists and the gift of a ship originally costing \$150,000 to replace the vessel of the Scripps Institution of Oceanography lost by fire in November.

The president of the university was Robert G. Sproul, while the regents (8 ex officio and 16 appointive) were headed by Governor Frank F. Merriam.

**Cambodia:** see FRENCH INDO-CHINA.

## Cambridge University.

The numbers of junior students in residence in the Eastern term of 1937 were nearly as before: about 5,400 men and 500 women. The men who matriculated in the Michaelmas term of 1936 numbered 1,706; not quite so many as in some years of the decade, but more than half as many again as in the last Michaelmas term before the War. The Ph.D. was conferred in 1936-37 upon 76 persons, a considerable advance upon any year since the institution of primary degrees for research. Two new chairs, of Comparative Philology and Mediaeval History, were established and filled during the year. Being both on the Arts side, they help to redress the balance between Arts and Science, which recent creations of scientific professorships have tended to disturb.

The busiest years of building and rebuilding are over; but work on a new home for anatomy proceeds; a mathematical laboratory is to be built as an abode for calculating machines of wide application and great precision; and the Pitt press building, fully restored to its proper use, has been repaired, to the great benefit of its façade.

The Fitzwilliam museum continues to receive valuable accessions. Its eminent director, Sir Sydney Cockerell, retired, however, at Michaelmas, after a long tenure of office, in which the fame of the museum rose high.

Of the losses due to death during the year, it must suffice to mention the gravest. After Clerk Maxwell, Rayleigh, Thomson, to be the fourth Professor of Experimental Physics was an arduous task, but Ernest Rutherford (Baron Rutherford of Nelson) did not fail. He died in the fullness of his powers, while he had it in him to add yet greater lustre to the Cavendish laboratory over which he had presided since the War.

(E. HAR.)

## Cameroons.

This former German colony is administered partly under a British and partly under a French mandate.

The British Mandate comprises a strip of territory extending north-east along the eastern frontier of the Protectorate of Nigeria from the Bight of Biafra to Lake Chad. Area, 34,081 sq.mi.; pop. (est. 1936), African 825,234, European 382. The mandate is administered as part of Nigeria (*q.v.*), and all Nigerian ordinances apply. The main product is cocoa, other exports being palm-oil and kernels, rubber and bananas; chief port, Tiko. Total imports (1936), £242,588; exports £445,459. Revenue (1935-36) £184,771; expenditure £233,178.

The French Mandate comprises the greater part of the former German colony. Area, 166,490 sq.mi.; pop. 2,192,000. The territory has administrative and financial autonomy. Yaoundé is the capital, and the chief port, Duala. In 1936 there were 2,950 mi. of road, 318 mi. of railway and 1,150 mi. of telegraph. It produces ground-nuts, palm-oil, almonds and hides. Imports (1936) frs. 87,800,000; exports frs. 94,200,000.

## Camp Fire Girls.

The year of 1937 marked the Silver Jubilee of Camp Fire Girls. It was a year of reminiscence, stock taking, and comparison. Since it is estimated that more than 2,000,000 girls have been members of the organization in the United States, Great Britain, and other countries since its inception, the theme "Then and Now" was used at many local celebrations commemorating the Silver Jubilee. A founders' luncheon, held at the Waldorf-Astoria in New York honoured the group of educators who were responsible for the original program.

Particularly colourful and interesting were the "Then and Now" camping pageants held at the 122 Camp Fire camps. Camp Fire Girls was a pioneer in the promotion of camping for girls. In 1911 very few girls had had the advantage of a camping experience. In 1937, 20,600 girls camped in well equipped and excellently staffed Camp Fire camps. Another highlight of the year was the launching of the new *Book of the Camp Fire Girls*.

The experience of the Guardians (leaders of Camp Fire groups), the reaction of the girls, and the advice of specialists were all taken into consideration in this revision of the Camp Fire Girls' manual, which was several years in preparation.

CAMP FIRE GIRLS, using dolls, learn how to bathe a baby

Printed late in December 1936, it was formally introduced by Mrs. Franklin D. Roosevelt, wife of the president of the United States, who is chairman of the Advisory Council of the Camp Fire Girls organization.

A new manual for the Blue Birds, the junior organization of Camp Fire Girls, was edited for publication early in 1938. During the year the usual activities in the seven crafts: home, hand, and health craft, camping, nature lore, business, and citizenship, were enjoyed by the Camp Fire Girls. In Great Britain, Her Highness, Princess Marie Louise, honoured the Camp Fire Girls by becoming a patron; Lady Hearn, widow of the late Sir Walter Hearn, became president; and His Excellency, the American Ambassador to London, the Honourable Robert W. Bingham, became vice-president.

(C. F. Lo.)

**Canada.** The year 1937 may be described for Canada as one in general of further industrial advance out of the depression that reached its lowest point in the spring of 1933. Salient features of this economic recovery are seen in the increase of industrial production, export trade, and mining output. During the first eight months, the index of physical production averaged only about 6% below that of 1929, the most active year in Canadian business. Expressed as a percentage of the base year of 1926, this index averaged for the first eight months 121.6 as compared with 129.1 for the same period in 1929. For the month of October the index for business operation stood at its highest since 1929 (127.4). Canadian export trade for the first seven months of the year showed an increase of \$113,302,000, giving a total of \$617,009,774, the highest since 1930, placing Canada in the fifth rank in world trade. The favourable trade balance for the year ending July 31, was \$403,961,000 as compared with \$299,753,000 for 1936 and \$241,854,000 for 1935. In mining output, the production of gold, despite the "gold scare," was higher than in 1936, the production for October reaching a new high monthly figure for all time of 363,908 ounces. To June 1 copper production was 18% higher than for the same period of the preceding year, nickel 35%, and asbestos 65%. The estimate for the total mineral production for 1937 (\$435,000,000) shows an increase over that for 1936 of \$360,340,000, the highest on record. There has been a marked expansion in the iron and steel industry, and the construction trades, though still far behind the 1929 level, showed gains of 25% over last year. An encouraging feature was the increase in carloadings despite the decline in grain movement.

For the first seven months of the fiscal year, income tax collections amounted to \$99,202,556 as compared to \$84,072,599 for the same period a year ago. Customs and excise revenue for the first six months rose to \$159,872,000, an increase of \$31,394,000; total ordinary revenue increased from \$233,462,999 to \$280,919,554. Gross dividends for the first ten months were \$219,600,000, an increase of \$41,300,000 over the same period for 1936; bond interests showed an increase of 4.7% over 1936. In the twelve months ending September 1937, combined assets of the chartered banks increased by \$135,000,000 to \$3,340,000,000.

Employment has been steadily increasing in all but the prairie provinces, the situation being especially acute in Saskatchewan. Relief rolls have been reduced by 600,000 since April 1936, and now stand at 900,000 persons. The general index of employment, as tabulated in the Bank of Nova Scotia survey for October 1937, shows a distinct advance in the figures of the year before, although it does not mean that the situation is as favourable as at the time of the 1929 level, as the number of those seeking employment has increased considerably.

**Disturbing Elements.**—One or two disturbing elements in this forward trend are seen in the fall in value of base metals; in an

**EMPLOYMENT IN CANADA:** Index as of first of month, adjusted for seasonal variation. Compiled by Dominion Bureau of Statistics from reports from representative establishments, including construction and maintenance, manufacturing, mining, service, trade, and transportation

apparent over-production of newsprint; and in the falling off of outside markets for lumber, owing partly to the increased shipping rates. The severe depression in the stock market since August has been a decided set-back.

The gross Dominion, provincial and municipal debt of \$7,039,091,538 for the year ending July 31 is a heavy burden upon the country: the railway situation, the maintenance of two duplicate lines across the country, one private, one public, though slightly improved over last year is still a very serious problem. The number of immigrants allowed into the country to settle is still very small, totalling only about 9,000 for the six months ending September 30, an increase of but 2,000 over 1936.

Moreover, the general improvement in industry and employment has not been felt in all parts of Canada. The most discouraging feature of the situation was the continuance in Western Canada to a great extent of the drought and unfavourable conditions which seem to threaten the very existence of wheat-growing over large sections of the prairies. This was particularly the case in Saskatchewan. The total wheat crop of the prairie provinces was 181,000,000bu., as compared with last year's short crop of 212,000,000bu., the smallest since 1914. This gives an average yield of 6.7bu. an acre, the lowest on record, as compared to 15.7 for 1928-32 and 10.4 for the drought years of 1932-36.

In Saskatchewan, which has 57% of the total wheat acreage in the west, the wheat crop was a complete failure except in one or two small areas. The yield for the province was only 2.5bu. to the acre. Heavy losses were also suffered in feed, grain, and fodder, owing to the severe rains in the spring and the summer drought. About 250,000 cattle were moved from the dry belt. Farm income in Saskatchewan is therefore very low with the consequence that 500,000 people, more than half the population, will be in receipt of relief this winter.

A large part of the wheat crop of Eastern Alberta entirely failed but in the other sections of the province the crop was large enough to bring the average yield up to 10bu. an acre. In Manitoba, on the other hand, the situation was decidedly improved over that of previous years. The wheat crop of 53,000,000bu., 18.5bu. an acre, was larger than the bumper harvest of 1928. Hence in Manitoba the farm income is high, with a good crop commanding the highest prices obtained for a decade. No. 1 Manitoba Northern wheat, which sold in 1926 at \$1.50, reached \$1.36 in 1937 as compared with \$1.06 in 1936. This increase in

**Recent Fluctuations of Employment in the Dominion as a Whole**

	Oct. 1, 1937	Sept. 1, 1937	Aug. 1, 1937	July 1, 1937	Oct. 1, 1936

price will make the total income from the western wheat harvest for 1937 almost as great as that of the year before, but less evenly distributed.

**Finance.** — The economic situation of the Dominion was reflected in the legislation of both the Federal and provincial Governments. The Dominion budget for 1937-38, as presented by the Hon. Mr. Charles Dunning, minister of finance, estimated expenditures at \$520,000,000, revenues at \$485,000,000, leaving a deficit of \$35,000,000 as compared with the deficit for 1936-37 of \$87,395,000, and \$159,989,000 for 1935-36. There was no reduction in taxes, and no new taxes were added. Hope was held of balancing the budget within two years. On Oct. 31, 1937, the Dominion Treasury reported a seven months' surplus amounting to \$33,372,600. At the same date a year before, there was an apparent deficit of \$64,003,380, so the improvement for this seven-month period totals about \$100,000,000.

Manitoba and Saskatchewan were in the most severe financial straits: in Ontario, Mr. Hepburn showed a surplus for the fiscal year of \$9,313,938.54, and a reduction of \$33,098,165.39 in the gross debt of the province during the year. Legislation for relief, both Federal and provincial, sought to curtail assistance in direct form. Ontario appropriated \$14,000,000 for highway improvement, which cut down to a great extent the number of the unemployed within the province. The Federal Government in co-operation with the provinces took measures to assist in the establishment of work for unemployed young people. Dominion-provincial agreements were formed to provide for single homeless men upon farms throughout the Dominion. The Home Improvement Plan was continued for 1937. In November the Canadian prime minister, Mr. Mackenzie King, asked the provinces whether an amendment to the British North American Act to permit Federal control of unemployment would be acceptable but met with objections from Quebec, New Brunswick, and Alberta.

In Alberta the legislation of the province followed (as described elsewhere: *see* under ALBERTA; ABERHART) the acute phases of the Social Credit crisis. The close of the year witnessed a situation in which the provincial legislation reducing or cancelling public and private debts awaited final settlement. Meantime the province, at the end of November 1937, had defaulted to the extent of over \$6,000,000.

In the special session of the provincial assembly in August, proposed legislation for licensing banks and financial houses and their employees, and an Alberta Press Control bill to give the province wide restrictive powers, together with a bill to control credit, were refused assent by the lieutenant-governor (who holds office as a Dominion official) and later declared *ultra vires* by the Supreme Court at Ottawa.

This whole matter is still pending, no final decision being possible short of the Privy Council.

**The Rowell Commission.**—An event of importance was the appointment in August of a royal commission of five, with Mr. N. W. Rowell, chief justice of Ontario, as chairman, to investigate the economic and financial basis of the constitution in the light of economic and social developments of the last ten years, which may lead to the revision of the British North American

PREMIER WILLIAM ABERHART of Alberta, author of a social credit experiment

Act. A group of expert economists, headed by Dr. W. A. Mackintosh of Queen's university, was named as research staff for the commission. The commission is to visit each province and to hold sittings to hear the proposals of the various Governments as to the conditions within the provinces. By Dec. 15, 1937, the Rowell Commission had sat at Winnipeg and Regina. In Manitoba it was claimed by the provincial Government that unless help was given the province it would be forced to default. It was proposed that the Dominion Government cancel its relief loans (about \$22,000,000) to the province and capitalize at 3½% the annual provincial subsidies, which would mean the assumption of \$52,000,000 of the provincial debt. The rest of the provincial debt would be refunded at 3½% with the co-operation of the Dominion. It was stated that at present the tax rate is 40% higher in proportion to the income than the average of the provinces. The population of the province is 6.75% of the Dominion and the national wealth since 1928 has been but 5%. The Government of Saskatchewan in its official brief suggested subsidies, new taxes, tariff reductions and a shift to the Dominion of social services and debt burdens.

Other developments of interest were the adoption of the plans for a Trans-Canadian Air Line which began operation on September 1. Mr. S. J. Hungerford, president of the Canadian National Railway was appointed president. Fifty-one per cent of the stock was given to the Canadian National, private companies being allowed to participate in the ownership of the remainder but "profits to be strictly limited." A large part of the national defence budget of \$34,999,871 (an increase of \$7,205,570 over that of 1936) was for the building of aeroplanes, landing grounds, etc.

**Canada and the Empire.**—The relations of Canada within the Empire were those of continued harmony and goodwill which contrasted with the somewhat anxious situation at home. In the spring a new Anglo-Canadian trade agreement was drawn up to go into effect September 1. This replaces the agreement drawn up at the time of the Imperial Conference in Ottawa (1932), tending toward freer and more open trade and providing for a large number of reductions in the Canadian customs tariff under the British preference, while Canadian exports are guaranteed preferences or free entry covering an extensive list of foodstuffs and manufactured commodities.

The coronation of May 12 was attended by a large number of Canadians. Among those officially representing Canada were Mr. Mackenzie King, the prime minister; the Hon. Vincent Massey; Rt. Hon. R. B. Bennett; Hon. Charles Dunning; Hon. Ian MacKenzie; Hon. Raoul Dandurand; and a military contingent of 334 of all ranks. The Imperial Conference of 1937, opening in London two days later, was attended by a Canadian delegation headed by the prime minister. Till the end of the year nothing

PHYSICAL VOLUME OF BUSINESS in Canada: combined index of industrial production, distribution, and agricultural marketings. Compiled by Dominion Bureau of Statistics

had been officially announced as to the proceedings of the Conference except mere generalities.

Senator Raoul Dandurand was appointed head of the Assembly of the League of Nations. He later attended the Nine-Power Conference of the Sino-Japanese conflict. Trade pacts with Australia and New Zealand were renewed and a new one made with Guatemala. An important trade agreement was made with Belgium, Canada's third best customer for 1936 with a trade of \$30,000,000, a figure expected to double during 1937.

NICKEL PRODUCED in Canada, source in recent years of more than 80% of the world's supply

**United States and Canada.**—Relations with the United States continued on the footing of assured goodwill. In July 1936 President Roosevelt visited Ottawa. In the following March the Governor-General of Canada and Lady Tweedsmuir visited Washington. President Roosevelt included a visit to Victoria, B.C., in his western tour in October, and the American secretary of State, Mr. Cordell Hull, made a two weeks' "goodwill tour" during the same month to Ottawa and Toronto, where he received an honorary degree from the provincial university.

The tourist trade between the two countries was the heaviest yet known. Canada has begun to realize the wealth of this trade and to capitalize on it, especially in the maritime provinces. Roads have been improved and made more accessible for the tourist; various booklets have been published and press bureaus established at the cost of millions of dollars. It is estimated that in 1936 about \$10,000,000 was spent by U.S. tourists in the maritimes, a considerable increase over previous years. It is also estimated for 1936 that the expenditure of American tourists in Canada exceeded those of Canadian tourists abroad by about \$170,500,000 (\$247,000,000 spent by visiting Americans as against \$76,523,000 spent by Canadians in the United States). Although figures for 1937 are not complete, an increase of almost a million tourists was recorded during the first half of the year, when 6,374,339 visitors entered Canada from the United States as compared with 5,409,331 for the same period of 1936.

Trade with the United States, stimulated by the reciprocal treaty of Nov. 15, 1935, showed an increase. Comparing the years ending August 1936 and 1937, imports from the United States rose from \$340,004,000 to \$453,816,000; domestic exports from Canada to the United States from \$383,563,000 to \$481,158,000. A new trilateral trade pact is under discussion as between England, Canada, and the United States. This, however, can scarcely assume final form until well into the year 1938. It is generally understood that Canada will give up several valuable exclusive concessions in the British market in order that American producers may share them. The Dominion will receive in return trading concessions with the United States market.

**Politics.**—The Dominion Government continued under the administration of the Liberal Party under the leadership of Mr. Mackenzie King as prime minister, elected to power Oct. 14, 1935. The political changes of administrations and parliaments in the nine provinces are duly chronicled in their respective places (*see under ALBERTA, etc.*). But for comparison's sake it can be noted here that general elections were held in three of the nine provinces in 1937. In June the liberals in British Columbia under Premier Pattullo were returned to power by a large majority (31 out of 48 seats). In a Federal by-election in Victoria in December another seat was gained by the liberals. In the election in Nova Scotia on June 29 the liberal premier, Mr. Angus Macdonald, was re-elected (the party winning 25 of the

30 seats). In Ontario on October 6 the liberals were returned to power with Mr. Hepburn as premier for a second term. The Ontario contest excited wide interest throughout the Dominion as reflecting in part the newest phase of the labour movement in the conflict between craft unions of the older type and the new industrial unions, and the question of the political significance of the latter type. With the new organization had appeared the newer methods of sit-down strikes, etc. Mr. Hepburn's victory at the polls was very widely held to represent a public disapproval of the new unionism. In April there had been an outbreak of sit-down strikes in the province, by far the most significant one a sixteen-day strike at the General Motors plant at Oshawa. Mr. Hepburn's insistence on getting rid of the United States union representative of the C.I.O. and refusing to put the strikers on relief, led to the resignation of the Hon. Mr. Croll, minister of welfare, and the Hon. Mr. Roebuck, attorney-general. It also determined Mr. Hepburn to call an election for the fall, well before the end of his term.

In November Mr. Albert Matthews was appointed lieutenant governor of Ontario to succeed the Hon. Dr. H. A. Bruce whose five-year term of office expired in October. The Government decided at the same time to abandon the institution of a Government House, hitherto placed by the province at the disposal of the lieutenant-governor.

Events in the world of art and letters were the various regional drama festivals and the Dominion festival held at Ottawa in March. In November national book fairs were held in Toronto, in Montreal, and elsewhere. Canadian Poetry Night was celebrated in Toronto November 24. Mr. Emile Brunet of Montreal was awarded the *Grand Prix* at the Paris Exposition for his relief work. Dr. E. W. Archibald was named Doctor of Medicine, *honoris causa*, by the University of Paris. The annual historical art exhibition of the National Gallery took the form of a one-man exhibition of the work of the late James Wilson Morrice.

In educational matters an important event was the appointment of Dr. Lewis Douglas, of Arizona, well known in the United States as member of Congress and director of the budget (1933-34), to be principal of McGill university.

In 1937 death gathered its annual toll including among those eminent in Canadian life (in January), Brother André, Prof. Edmund Broadus; (in February) Dr. Francis A. Scrimger, Maj.-Gen. Sir Frederick Loomis, Senator Patrick Burns; (in March) Hon. P. C. H. Primrose; (in June) Brig.-Gen. C. A. Smart, Sir Robert Borden, Rt. Hon. Sir William Lloyd; (in July) Sir Charles Saunders; (in September) Senator Rodolphe Lemieux; (in October) Sir Thrasher Cook; (in November) Rev. Dr. Charles W. Gordon ("Ralph Connor"), Hon. Dr. Simon F. Tormie; (in December) Sir Andrew Taylor, and Sir Douglas Hazen, chief justice of New Brunswick. (*See also DUST STORMS; WATER POWER.*)

(S. LEA.)

**Canadian Banking:** *see BANKING: Canada.*

**Canadian Literature.** Of literature in Canada in 1937 there is more than usual to be said, chiefly because literature has been saying more than usual for itself—through a new "loud speaker" called the Book Fair. Two such exhibitions were held in November by the Association of Canadian Bookmen, an alliance of publishers and booksellers with authors and librarians. The Canadian publishers' business is chiefly that of selling books published in the United States and Great Britain; but a large space was set apart for Canadian books, arranged by the Canadian Authors' Association. The number, variety, and quality of these native books astonished readers

still under the impression that all books of great literary value and interest must originate in other lands. The new literature produced in Canada during the year showed at least no falling off in spirit or material, with perhaps increased attention to form, especially in the making of verse. If no new star of first magnitude appeared, most of the older stars maintained their rank. Death claimed two, Charles Gordon, whose "Ralph Connor" tales enjoyed enormous popularity for many years, and Annie Charlotte Dalton, M.B.E., outstanding poet, of Vancouver.

The governor-general's two medals, for the best works of fiction and other prose published in Canada in 1936, were awarded respectively to Bertram Brooker of Toronto, for his novel *Think of the Earth*, and the late T. B. Robertson of Winnipeg for his *Newspaper Pieces*. The SERANUS prize for poetry was awarded to Dr. George Herbert Clarke, of Queen's university, Kingston.

(H. A. K.)

**Canals and Inland Waterways.** So many United States canal and waterway projects were completed in 1934 and 1935 (St. Mary's canal, the Louisiana-Texas and Florida East Coast waterways, and Seattle's Lake Washington canal) that 1937 efforts were largely devoted to maintenance. Four current operations, however, were of importance. Dredging to increase to 32ft. the depth of the seven and a half mile Cape Cod canal bought by the Government for \$11,500,000 in 1928 was only 60% complete on June 30, 1937. Deepening of the 19mi. Chesapeake and Delaware canal to 19ft., carried on at a cost of over \$4,000,000, was 94% complete at the end of the fiscal year. A shallow-draft intracoastal waterway to parallel the Atlantic coast and be used primarily by pleasure craft was extended, and the Sabine-Neches waterway of eastern Texas was deepened. In both construction and maintenance projects, emergency relief and public works funds were widely used, less than two of five million dollars of Federal funds spent on the New York State Barge canal coming from regular funds and over ten million dollars of sixteen million spent since 1928 on the Cape Cod canal coming from extraordinary sources.

Recently issued statistics on United States rivers and canals reveal that canal traffic increased during 1936. The New York State Barge canal surpassed its record for the 20th century by carrying 5,014,206 tons valued at \$250,736,636. Other canals carrying over \$50,000,000 of traffic were: St. Clair Flats canal at Detroit, \$865,189,597; St. Mary's Falls canal, \$799,786,656 (of which a little less than 50% was purely domestic traffic); Houston Ship canal, \$619,326,957; Port Arthur canal, \$449,265,465; Sabine-Neches waterway, \$256,913,443; Cape Cod canal, \$157,022,288; New Orleans Navigation canal, \$140,461,545; Black Rock canal (Buffalo, N.Y.), \$96,394,910; and Chesapeake and Delaware canal, \$61,975,342. Total canal and waterway traffic for 1936 reached 150,760,328 tons valued at \$2,397,610,023. For statistics regarding the Panama canal, see PANAMA CANAL AND CANAL ZONE.

(X.)

**Great Britain.**—The canal industry in Great Britain has been under a cloud for so long and the prospects of its resuscitation continue to be so disheartening that there is very little to record in the way of actual development and expansion during 1937. Following the energetic enterprise which led to the amalgamation of eight separate undertakings under the control of the Grand Union Canal Company with the carrying out of an important program of improvements, including the 51 new locks on the Warwick section of the canal, completed in 1934, combined with the improvement by the Trent Navigation of the section of the river between Newark and Nottingham, where a number of new locks have been constructed during the past 10 years, there has been a lull in activity.

The most notable event of 1937 has been the opening of the Dog-in-a-Doublet lock and sluices in the tidal section of the River Nene, for the purpose of removing a shoal, regrading the riverbed, and improving the channel for navigation. Prior to the carrying out of the improvement, there was an obstruction in the river two miles below Peterborough, due to the existence of the Northey Gravels, which had been of service in the past by acting as a natural weir, keeping back the brackish tidal water and so maintaining a source of fresh water above the shoal for a supply to the town of Thorney. The construction of the weir has enabled the shoal to be dredged without detriment to the Thorney water supply, and the needs of navigation have been further met by the construction of a lock, 145ft. long and 26ft. wide, capable of receiving vessels 133ft. long by 22ft. wide, with a loaded draught of 9ft., while other locks on the river are being reconstructed to receive canal barges, 78ft. long by 14ft. 6in. wide, with a loaded draught of 4ft. 6 inches. The Dog-in-a-Doublet lock is at the extremity of the tidal portion of the River Nene, and the new structure has been designed to meet a tidal variation of about 12ft., with a permanent head of 11ft. on the upstream side of the sluice.

**France.**—In other countries of Europe, there has been considerable activity. Work in France has been carried on under a program approved by the Higher Council of Public Works, which includes dredging operations for widening and deepening the channels of rivers, the removal of awkward bends, the electrification of lock operations machinery and the reduction in the number of weirs. Notably in the first category come the improvements effected in the navigable waterways connecting the Paris basin with the northern coalfields, so as to afford a passage for craft drawing fully 7ft., whereas the previous limit was less than 6 feet. The unit load capacity has thereby been increased from 280 tons to 350 tons. Dredging has also been done on the canal systems of the Marne, the Rhine, and the Rhône. Electrification of lock machinery has been carried out on the Rhine-Rhône canal below Strasbourg, and on the canalized sections of the rivers Oise and Scheld.

**Belgium.**—In Belgium, the Charleroi to Brussels canal has been widened and deepened so as to be able to accommodate 1,350-ton boats, whereas it was originally constructed for craft of 70 tons only. Work is well forward on the Albert canal about 70mi. in length, which is to connect Liège and Antwerp. It has a minimum width of 85ft. (26 metres) and a depth in the centre of 16ft. 6in. (5 metres). It will be able to accommodate Rhine barges of 2,000 tons capacity. The portion of the canal lying between Haccourt and Neerhaeren is already in service.

**Holland.**—In Holland, following the completion of the Juliana canal along the Maas and the Trente canal from Zutphen to Enschede, opened in 1936, the works are in hand estimated to cost over 140 million guilders. These include the canal from Amsterdam to the Rhine, the ameliorations of the river Meuse and the waterway from Groningen to the Ysselmeer (formerly Zuiderzee) and the enlargement of the canal from Amsterdam to Ymuiden.

**Germany.**—In Germany, on the Rhine-Main-Danube system, the first portion of the connection is so far advanced that 1938 should see Würzburg accessible to large craft. Locks are being reconstructed between Frankfort and Aschaffenburg so as to take larger vessels. The last section of the great high-water protection banks extending to and below the town of Stuttgart, associated with the works on the Neckar, is making such progress that during 1938 the main undertaking is expected to be completed. The canalization of the Mid-Weser from Minden to Bremen for craft of 1,000 tons has been systematically pursued, and nearly the whole extent is in hand. In the autumn of 1937, the canalization of the Werra for a length of 100km. from Münden to Wartha was

begun. On the Weser-Elbe section of the Mittelland canal, the Allerbüttel-Sülfeld lock has been completed, so that navigation is possible as far as Neuahaldensleben. By the end of 1938, the Rothensee Lift will in all probability be put into commission.

**Russia.**—Perhaps the most notable event of the year in canal annals was the opening to traffic in May last of the 80-mile waterway known as the Moscow-Volga canal, which connects the inland port of Moscow with the river Volga, and places the former in communication with the Caspian sea, as also through the Marinsk river system and the recently constructed Baltic-White Sea canal, Reva river and Ladoga canal, with the Baltic and White seas. When the Volga is ultimately connected with the river Don, by means of the Volga-Don canal about to be undertaken and expected to be finished by 1942, ships from Moscow will be able to traverse a deep-water route to the Black sea. The Moscow-Volga canal is a remarkable piece of engineering construction, comprising 200 million cubic metres of earthwork excavation, 3 million cubic metres of mass concrete work, and 450,000 cubic metres of reinforced concrete in structures. There are 11 locks to enable a passage to be made over the elevated plateau which begins a few miles from the Volga, and extends for more than 25 mi. along the course of the canal. In conjunction with the canal scheme, the city of Moscow has been provided with a greatly increased supply of drinking water. The river Dnieper has also been much improved for navigation by the removal of a series of rapids. (See also SUEZ CANAL.) (B. CU.)

**Canal Zone:** see PANAMA CANAL AND CANAL ZONE.

**Canary Islands,** group of 13 islands (7 inhabited) in the Atlantic, off the African coast between 28° and 30° N. lat., governed as an integral part of Spain, of which they form two provinces, Las Palmas (capital, Las Palmas, in the island of Gran Canaria) and Santa Cruz de Tenerife (capital, Santa Cruz, in the island of Tenerife). Area, 2,807 sq. mi.; population (1934) 599,712. Tobacco and bananas are grown, and wine and timber produced; there is a considerable fishing industry. Since the outbreak of Gen. Franco's rising in 1936, the islands have been under insurgent control.

**Cancer.** Most striking in 1937 was the work of Peyton Rous of the Rockefeller Institute in which he demonstrates that by inoculating into the ears of rabbits an emulsion from a wart-like growth (studied in rabbits by Shope and proved by him to be infectious) cancer can be obtained by administering shortly after the appearance of the harmless papilloma a moderate quantity of a known carcinogenic coal-tar. Soon after this tar injection extensive and rapidly growing squamous-cell cancers appear in the ears, metastasize early to the other organs of the body and destroy the animal in a few months.

This raises again the much discussed question of the part which viruses may play in the production of tumours both animal and human. Rous was originally responsible for this idea when he discovered that a sarcoma, a malignant tumour of the fowl, could be transferred to other fowls by the use of an extract filtered through a porcelain filter of such density that it held back all ordinary bacteria. Whether this cancer-causing agent was a chemical substance or a living organism Rous was unwilling to say. Later W. E. Gye of London and others felt from their studies that the virus was probably a living creature like the ordinary bacteria.

Today the virus question has been entirely transformed by the discovery of W. M. Stanley, R. W. G. Wyckoff and other workers in the field that certain viruses, notably that of the tobacco plant, possess some of the properties of the living organism in that they can multiply, but on the other hand they are crystallizable and

hence are presumably proteins of very large molecular weight, as shown by their sedimentation rate. The whole subject needs much more study and can not be considered as finally settled. The most probable explanation of the action of the combined virus and tar treatment is that the virus in some way starts the growth of the epithelial cells to form a papilloma and thus sensitizes the cells to the action of the tar, for under normal conditions tar-painting is not a very effective method of producing cancer in rabbits, most of the growths described being mere papillomata.

The extraordinary discovery in the past few years of rather simple chemical substances which produce cancer in large numbers in animals has been extended both in London under E. L. Kennaway, J. W. Cook and their colleagues and at Harvard University in Boston by L. F. Fieser and his collaborators. These carcinogenic substances have been used to confirm the work of F. D. Bullock, M. R. Curtis and W. F. Dunning on their somatic mutation theory governing the production of cancer; they have been employed in obtaining a large number of interesting types of tumours now including those from almost all the organs of the body in animals, and in connection with their effect in producing oes-trus in animals.

**Intricate chemical**

Cancer specialists (top to bottom): DR. MAUD SLYE of the University of Chicago; DR. FRANCIS CARTER WOOD of Columbia University; DR. LOUIS F. FIESER of Harvard University; DR. JAMES BURGARDNER MURPHY of Rockefeller Institute; DR. WARREN HARMON LEWIS of Carnegie Institute

studies are under way to determine just what arrangement of the hydrocarbon molecule produces the carcinogenic effect. This means the production and testing on sensitive animals of a very large number of compounds. In general, those of simpler composition are most effective. Investigations are under way to find whether any of these compounds are present in the bodies of those with developing cancer, whether or not they may be present in food, may be developed by cooking, and a host of similar aspects. E. C. Dodds and his collaborators at the Middlesex hospital, London, have chosen to work in this field and a large series of compounds have been discovered capable of producing oestrus or heat and of inducing mating in animals. Some of these are not related to the carcinogenic hydrocarbons, for instance, two known as diphenylethylene and triphenylethylene are highly potent.

In other fields there has also been great activity. For example, the production of large quantities of neutrons in an apparatus known as the cyclotron developed by Ernest O. Lawrence at the University of California has permitted the investigation of the biological effects of these uncharged particles and according to experiments so far conducted, these neutrons seem to be more effective in the destruction of cancer than their charged relatives, the electrons, which are the present basis for the treatment of cancer by X-ray and radium. In addition Lawrence has been able to produce a large amount of artificial radioactive substances, among them a form of common salt which gives off powerful radiations but loses its strength very rapidly, falling to one-half in about 14 hours. This suggests the possibility of injecting the salt into a tumour because it is not poisonous, except for its capacity to radiate.

Other compounds, such as radioactive vanadium, have also been produced which have a longer life and therefore may to a certain extent replace radium, but these isotopes of a higher atomic weight are much more difficult to produce in quantity and require far greater amounts of energy.

In response to this synthesis of radioactive elements, together with the successful surmounting of engineering difficulties in the production of extremely high voltage X-rays, the price of radium has fallen from \$120,000 per gram to \$25,000 per gram. High voltage X-ray apparatus will probably shortly replace the use of large quantities of radium in the so-called packs, for the X-rays produced at 1,000,000 volts are practically equivalent to radium, are cheaper, give a much deeper penetration into the tissues, permit the treatment of a number of patients at a time, and have certain useful qualities making their development a distinct advance in the treatment of cancer. (See also **RADIOTHERAPY; X-RAY.**) For statistics see **PUBLIC HEALTH SERVICES.**

(F. C. W.)

**Candy:** see **CONFECTIONERY.**

**Cane Sugar:** see **SUGAR: Cane Sugar.**

**Canning Industry.** The outstanding tendency of the canning industry throughout the world during 1937 was improvement in quality. This naturally led to increased co-operation within the industry and with other industries. For this purpose canners' associations were maintained throughout the world. In some countries the officers of these associations had official Government status, and in others Government experiment stations and colleges co-operated in the improvement of canning technology and the production of canning crops.

During the year, the first International Canners Convention was held in Paris, and was attended by representatives of eight of the leading canning countries. The purpose of the convention was the establishment of a permanent international body for

standardizing rules and regulations affecting the canning and labeling of foods. The substitution of corrosion resistant materials in canning equipment for those formerly employed was marked during 1937, and the employment of cold reduced plate has been greatly increased in order to reduce the corrosion of tin plate used in packers' cans.

At the close of the year cold reduced plate constituted approximately 45% of the tin plate used for canned foods, whereas a year earlier it constituted only 30%.

Equipment was developed during the year which is expected to aid in improving the quality of canned foods. For instance, the "Tenderometer" intended to determine the tenderness of raw peas used for canning, and the tubular blancher which provides an improved way of blanching peas, are both designed to improve the quality of that product.

Increased information on the processing of non-acid products was marked by the publication of the third edition of the processing bulletin of the National Canners Association. Development of new types of processing equipment and improved processing procedure was regarded as a marked advance in the art of processing (sterilizing) canned foods.

The pack of the canning industry of the United States during 1937 was the largest on record. For fruits, vegetables, specialties, fish and milk, over 10,000,000,000 cans were used as containers in addition to a large quantity of glass containers. For perishable vegetables alone, the products of over 1,500,000ac. were used for the canning industry.

(W. D. B.)

**Cape Verde Islands,** an archipelago belonging to Portugal, lying off the West African coast, between 17°13' and 14°47' N. and 22°40' and 25°22' W. The total area is 1,557 sq.mi., and the population 153,182, including about 6,000 Europeans. The islands are some 15 in number, and are divided into two groups, in relation to the prevailing north-east wind: Barlavento (windward) and the Sotavento (leeward). The seat of the governor is at Praia. There are over 150 primary schools and a secondary school in São Vicente.

About 100 ships a year call at the islands, and São Vicente is an important coaling station.

Revenue and expenditure for 1937 were estimated at £157,374 and £155,442 respectively.

**Capitulations.** The capitulatory régime, which had existed in Egypt as part of the Ottoman dominions from mediaeval times, giving special immunities and privileges to foreign nationals, came to an end on Oct. 15, 1937. On that date, under the terms of the Convention signed at Montreux on May 8, 1937, between Egypt and the capitulatory Powers (Great Britain, France, Italy, the United States of America, Greece, Belgium, Holland, Denmark, Norway, Sweden, Spain, and Portugal) the consular courts were closed for all judicial business concerning their respective nationals, except matters of personal status. The Convention allowed the capitulatory Powers to opt for the retention of jurisdiction in these last-named matters by their consular courts for the duration of the 12-year transition period for which it was agreed the mixed tribunals would continue to operate.

The Egyptian Government has agreed, for this transition period, to certain safeguards in the matter of discriminatory legislation and the expulsion of foreigners and with regard to the régime to be enjoyed by the educational, religious, medical, and charitable institutions created and administered in Egypt by the various Powers.

(A. Mn.)

**Carnations:** see **HORTICULTURE: Carnations.**

**Carnegie Trusts.** Carnegie Corporation of New York, established by Andrew Carnegie in 1911 and endowed with \$135,000,000, expends its annual income in grants to institutions and agencies whose activities aim at the advancement and diffusion of knowledge and understanding among the people of the United States and of the British Dominions and Colonies. During 1937, the corporation trustees appropriated a total of \$3,500,000 for: library interests, \$500,000; adult education, \$400,000; fine arts and museums, \$500,000; research and publication, \$750,000; general educational purposes in schools, colleges, universities, etc., \$1,500,000. The amount appropriated since 1911 totals \$162,000,000.

The five other Carnegie organizations in the United States, which were founded by Mr. Carnegie for specific purposes before the establishment of the corporation, with endowments now ranging from \$10,000,000 to \$30,000,000, followed their established programs.

**Carnegie Institute of Pittsburgh** (1896), which comprises an institute of technology, a museum of fine arts, a music hall, a museum of natural history, a public library, and a library school, installed Dr. Robert E. Doherty as president of the Carnegie Institute of Technology. The annual international art exhibit at the museum again attracted wide attention.

**Carnegie Institution of Washington** (1902), devoted to scientific research, expended \$1,700,000 in its program of encouraging investigation, research and discovery, and the application of knowledge to the improvement of mankind, specifically by work in astronomy (Mt. Wilson Observatory), terrestrial magnetism, geophysics, animal and plant biology, and historical research (especially in Yucatan).

**Carnegie Hero Fund Commission** (1904), established to recognize heroic acts performed by persons the nature of whose duties in following their regular vocations does not necessarily require them to perform such acts, made 60 awards of medals, or of funds for worthy purposes, in recognition of acts of heroism, thus bringing the total number of awards since 1904 to 2,965, and the total of money grants to \$5,000,000.

**Carnegie Foundation for the Advancement of Teaching** (1905), established to provide retiring pensions for teachers and to advance higher education, paid \$1,875,000 in retiring allowances to retired college professors, or their widows, making a total of \$33,000,000 paid for such purposes since its establishment. It has also continued its program of educational research and study, notably the eight-year study of secondary and higher education in the State of Pennsylvania. (See also UNIVERSITIES AND COLLEGES.)

**Carnegie Endowment for International Peace** (1910), established to serve the purpose indicated by its name, expended \$650,000 in its efforts to further friendly understanding among the nations of the world. The year marked the completion of the great co-operative enterprise, begun in 1914, of the preparation of the economic and social history of the World War, which resulted in the publication of 152 volumes. Continued progress was made also in the study of Canadian-American relations, the findings of which are being reported in 44 volumes. These two activities were made possible by corporation grants to the endowment.

(F. P. K.)

**Great Britain.**—During 1937 the trustees of the Carnegie United Kingdom Trust proceeded with their fifth quinquennial program of educational and social experiment begun in 1936, when several new lines of policy were defined for the period 1936–40. The chief features of the present program are important allocations for land settlement (£150,000); music (£30,000 in grants and guarantees to amateur choral and orchestral societies in affiliation with the National Federation of Music Societies); social

services, including village halls (£25,000); boys', girls', and young farmers' clubs; adult education, covering also an experiment for the 18 age group (£20,000), and museums (£15,000). In addition to assistance for the National Central library (£4,000 a year for five years), and to the Scottish and Irish Central libraries (approximately £2,000 a year each), the total allocation set aside by the Trust for library purposes during the five-year period amounts to £30,000.

In addition to the Carnegie United Kingdom Trust, there exist also in Great Britain: (a) The Carnegie Trust for the Universities of Scotland, whose income of £120,000 a year is divided between bursaries to students and advanced research work; (b) The Carnegie Dunfermline Trust, which conducts a wide range of activities in Dunfermline, Fife; and (c) The Carnegie Hero Fund Trust which disburses a large income (£22,311) in the form of awards to persons for acts of heroism in attempting to save human life.

**Caroline Islands:** see PACIFIC ISLANDS, MANDATED.

**Carter, Mrs. Leslie** (1862–1937), American actress, began her stage career in 1891 as a means of vengeance upon her millionaire husband who had won a divorce on the ground of infidelity. Under the tutelage of David Belasco, she scored her first great success in 1895 in *The Heart of Maryland*, which played in London after three seasons in the United States. Equally successful were *Zaza*, *Madame Du Barry*, and *Adrea* which followed. After 1906 when her second marriage caused a break with Belasco, she appeared in such hits as *Camille*, *The Second Mrs. Tanqueray*, *The Circle*, and *The Shanghai Gesture*. Born in Lexington, Ky., June 10, 1862, Mrs. Carter died in Santa Monica, Cal., Nov. 13, 1937.

**Casein:** see PLASTICS INDUSTRY.

**Catastrophes:** see DISASTERS.

**Cattle.** Large imports of cattle and calves into the U.S. from Canada and Mexico, and violent changes in the price for prime beef animals marked the cattle industry of North America in 1937. Canada shipped 208,552 head of cattle and 98,426 calves to the United States in 1937, compared to 191,149 cattle and 50,541 calves in 1936. Mexican shipments were also large. By June 19 the quota of calves admitted under low tariff duties was filled and by August the cattle quota of 155,799 had been exceeded, so that higher duties were paid on many head of imports. Oct. 1937, saw the highest U.S. price level, \$19.90, for prime grade beef steers since the World War. By the end of the year prices had dropped almost \$8. Contributing to the decline were the decrease in consumer buying power, owing to the business recession, a slight increase in cattle supplies, a seasonal increase in the supplies of poultry, a more than seasonal increase in the slaughter of hogs and a sharp drop in the price of hides. Slaughter of cattle in the United States in 1937 was approximately 10,000,000, compared to 10,972,000 in 1936 and a five-year average of 8,176,000. The slaughter of calves in 1937 was 6,250,000, compared to 6,070,000 and a five-year average of 4,640. Total number of all cattle in the United States Jan. 1, 1938, was 65,930,000. On Jan. 1, 1937, it was 66,448,000. The number of cattle being fattened on Jan. 1, 1938 was about 15% larger than the year previous.

The price structure for cattle in Canada during 1937 was dictated by conditions in the United States, the Dominion Ministry of Agriculture reported at the end of the year. There was practically no change in the number of cattle on Canadian farms from 1936 to 1937, the number being about 8,840,600. In England and

Wales there was an increase from 6,540,300 to 7,853,307, which may be in some degree owing to the fact that a change in the subsidy granted farmers now provides a premium on extra prime cattle marketed, as against only fairly good grades.

The severest changes the cattle industry suffered in 1937 were probably in South Africa where drought resulted in heavy losses of cattle and crops. The drought covered a large part of the hinterland, the Transvaal, Orange Free State, northern parts of the Cape Province and Natal and was so severe that, to assure meat supply, the Government opened the borders to increasing imports of cattle from Bechuanaland and the Rhodesias.

Drought also affected the cattle industry in France, where, in addition, losses from foot-and-mouth disease were prevalent. In Belgium the herds also suffered from the disease.

Although the United States exported meat in 1937 it imported a much larger quantity, 169,544,188lbs. Of this 94,713,708lbs. were beef and veal. U.S. exports of beef and veal were 12,666,286lbs. (See also LIVESTOCK.) (S. O. R.)

**CCC:** see RELIEF.

**Celebes Islands:** see DUTCH EAST INDIES.

**Cellulose:** see PLASTICS INDUSTRY; RAYON.

**Cement.** Since the product is used largely in the building industry, the cement industry has been seriously affected by the depression decline in building operations, and has shown one of the slowest recoveries found in any phase of the mineral industries. Total cement production in the United States declined from a 1928 high of 178,509,250bbl. to a low of 64,715,171bbl. in 1933, a decline of 64%, and had recovered only to 114,121,810bbl. in 1936, or 64% of the former high. In spite of some recession in the production rate in the second half of 1937, the year's output will show an increase over that of 1936. The great bulk of the output is the ordinary Portland cement; the special types of masonry, natural and puzzolan cements averaged only 1-2% of the total.

Recent technical developments are largely concerned with improved grinding, fuel savings through better combustion conditions, dust collection, and the changes produced in burning the clinker. (See also GYPSUM.) (G. A. Ro.)

**Central America,** the region between Mexico and Colombia, embracing the six republics of Guatemala, El Salvador, Honduras, Nicaragua, Costa Rica, Panama, and the Panama Canal Zone, and the colony of British Honduras. The area is 215,420 sq.mi.; population (estimate, 1937) 6,900,000. The main population centres are on the highland plateau adjacent to the Pacific, where the population from Costa Rica to Guatemala is white, mestizo, and Indian, tending more and more to pure Indian toward the north. The low Caribbean slope, including British Honduras, is largely negroid. Panama, too, has a large negro element. The total annual foreign trade is about \$120,000,000 in value. Imports are principally foodstuffs, as flour, and textiles and other manufactured goods. Coffee from the Pacific uplands, bananas from the lowlands, some gold and considerable cabinet woods comprise the main exports, except in British Honduras, where chicle and hemp are of considerable consequence. The greater part of the foreign trade is with the United States. In addition to export commodities, corn and beans are extensively grown for domestic consumption. The general trend of Central America was toward political stability and economic betterment in 1937, marred by the uncertainties of the coffee industry. Education and literacy vary from country to country, with Costa Rica the most advanced country, and Honduras the least. (See BRITISH HONDURAS; COSTA RICA;

GUATEMALA; HONDURAS; NICARAGUA; PANAMA; PANAMA CANAL AND CANAL ZONE; SALVADOR, EL.) (L. W. Be.)

**Central Australia.** The name Central Australia was formerly used officially for an oblong area of the Northern Territory lying below latitude 20° S., while the area above was known as North Australia. This division, effected for administrative purposes, March 1927 was, however, repealed by an act of June 12, 1931, and the whole of the area bounded by the 26th parallel of south latitude and the 129th and 138th degrees of east longitude was placed under the Northern Territory.

**Ceramics:** see FELDSPAR; GYPSUM.

**Cereals.** The world planted 571,625,000ac. to cereals and harvested 12,339,437,000bu. of grain, exclusive of rice and exclusive of cereal crops in Russia and China, for which no satisfactory figures are obtainable. This huge harvest, made up of five of the six great cereal crops, consisted of 3,549,016,000bu. (60lbs. to the bushel) of wheat from 250,615,000ac.; 3,385,649,000bu. of corn (56lbs. to the bushel) from 126,002,000ac.; 3,090,492,000bu. of oats (32lbs. to the bushel) from 90,774,000ac.; 1,253,550,000bu. of barley (48lbs. to the bushel) from 58,011,000ac.; 860,730,000bu. of rye (56lbs. to the bushel) from 46,223,000 acres. Russian crops would raise the foregoing considerably, as the reports for 1937 production indicate large yields and the U.S.S.R. is known to have harvested 1,259,000,000bu. of oats, 953,256,000 of wheat and 375,000,000bu. of rye in 1935.

Along with the planting and harvesting of this huge combined crop in 1937 there was also a further growth of laws regulating production, distribution and prices of grains. In France at the beginning of the 1937 harvest the price of wheat was fixed at \$1.72 a bushel, to protect French farmers from imports of lower-priced foreign wheat. In Italy the 1937 tariff on foreign wheat was about 26¢ a bushel. In Germany where there was a scarcity of bread grains, wheat and rye, governmental decree compelled the addition of 7% corn (maize) flour to wheat flour and the types of wheat flour were reduced from eight to one, in which extraction was raised from 75 to 75-80%. Four per cent corn flour was required in all rye flour in August to October, but, with the harvesting of a surplus potato crop, the Government ordered 6% potato flour added to rye flour instead of 4% corn flour which was mainly imported. Japan in 1937 reached the goal of its five-year wheat plan begun in 1932, with a production of 32,700,000bu. of wheat and exceeding 50,000,000bu. in 1937. Tariffs on foreign wheat encouraged Japanese farmers to better varieties and cultural methods, thereby increasing the yield, from land withdrawn from rice, barley and the cultivation of mulberry leaves for silk worms. However, wheat holds a minor place in Japanese diet compared to rice, which Japan now produces to the amount of 85% of consumption requirements. (See also BARLEY, CORN, OATS, RICE, RYE, WHEAT.) (S. O. R.)

**Ceylon.** A British crown colony, lying off the southern extremity of India and approaching within 6° of the equator. The area is 25,332 sq.mi., and the population 5,312,548. The capital, Colombo, has a population of 284,155. Jaffna has 45,708, Galle 38,424, and Kandy 37,147. The governor (Sir Andrew Caldecott since 1937) is assisted by a Board of Ministers, and a State Council of 60, elected by all adult Ceylonese, male and female.

The economics of Ceylon are dominantly agricultural. Coconut palms occupy about 1,100,000ac., and rice 850,000 acres. Rubber in 1936 was planted in 605,000ac., and tea in 558,000ac., the

latter giving employment to 700,000 labourers imported, not under indenture, from India. The total imports into the island in 1936 were valued at £16,100,000, and the total exports at £18,300,000. The imports are multifarious; rice, cotton goods, and oils being most prominent. The exports are mainly tea (£11,500,000) and rubber (£3,500,000). The United Kingdom takes half the exports and provides about one-fifth of the imports. The weights and measures are as in Great Britain; the coinage is in rupees and cents.

**Maldives.**—This is an archipelago about 400 mi. south-west of Ceylon, to which it is nominally a tributary, sending an annual embassy to Colombo. Population 79,281, all Muslims. The sultan resides in Malé, a small island 3 mi. in circumference. The islands are covered with coconut palms; millets and fruit are also cultivated. (See also WATER POWER.) (ME.)

**Chaco,** an undeveloped region in South America (area: about 100,000 sq. mi.) between Bolivia and Paraguay, and claimed by both. A five-year war over its possession was terminated by an armistice in June 1935, and representatives of six other American nations met those of the disputants in a conference at Buenos Aires in an effort to effect a permanent settlement. In May 1937, the two nations were persuaded to resume diplomatic relations, and in August an effort to withdraw Paraguayan troops and create a neutral zone precipitated the overthrow of Paraguay's dictator, President Franco. Continued political instability, in Paraguay especially, precluded further attempts at rapprochement in 1937, although the conference continued its efforts.

**Chain Gangs:** see PRISONS.

**Chain Stores.** In the United States, the significant developments in chain store retailing during 1937 were the efforts of the corporate chain stores: (1) to adjust their public relations and merchandizing methods to an increasing amount of restrictive State and Federal legislation, and (2) to meet the more intensive competition of independent retailers, and especially of the "voluntary chain" and the "super-market."

During the year, Pennsylvania and Tennessee for the first time passed graduated tax levies on the corporate chain. Georgia, Minnesota, North Carolina, South Dakota, and Wisconsin reenacted chain store tax measures. This new State legislation, taken together with the results of the court decisions of the year, brought the number of chain store tax laws in effect to 22.

The most significant judicial set-back to the corporate chain was the 4 to 3 decision of the United States Supreme Court on May 17, validating the Louisiana Chain Store Act, the only act to date that bases a graduated levy upon the number of stores operated anywhere in the United States rather than upon the number within the enacting State. Also disappointing to the corporate chain was the decision of the Texas Supreme Court on Dec. 1, which upheld the Texas Chain Store Act and its top annual tax rate of \$750 per store, higher by \$200 than any other effective State levy.

The attempts of the Federal Trade Commission during the year to enforce the Robinson-Patman Act and its prohibitions on the diversion of "brokerage" and on "unfair" discounts and allowances have operated to spread out large-scale buying advantages more evenly among corporate chains and independents. Moreover, the Miller-Tydings resale price maintenance enabling amendment to the Sherman Anti-Trust Act, approved on Aug. 17, has influenced the independent merchant to become more vocal in demanding that manufacturers of branded merchandise use the several State permissive fair trade acts, now numbering 42, to

establish minimum resale prices.

These legislative developments do not necessarily mean the destruction of all corporate chains nor even a sudden check on their progress. Chain store taxes fall lightly on a corporate chain that operates a limited number of units and thereby keeps out of the high State tax brackets. Chain taxes mean less to a corporate drug chain than to a corporate grocery chain for the volume per store and the net profit are considerably greater in the former case. A chain tax burden may be unequal as between two chains in the same field if one operates small stores and the other an equal number of large stores. Moreover, State and municipal taxation, initially directed at the corporate chain, may develop into revenue proposals to be applied universally to retailing. Already the Georgia State Revenue Department has ruled that the Georgia Chain Store Act applies to "voluntary chains" as well as to corporate chains. The Robinson-Patman Act also affects the independent and the "voluntary chain." Many of the "special discounts" formerly received by the corporate chains were similarly granted to the "independent" and to the "voluntary." Furthermore, in England, where price maintenance has prevailed for a very long time, the corporate chains or "multiple shops" have made consistent progress.

Other important matters of concern to the corporate chain during 1937 were the activities and growing stability of the "voluntary" chain in the food field, the spread of the "voluntary" idea into other fields, the growth of the "super-market" (it is estimated that at least 1,000 new, full-fledged "supers" were established in 1937—many by the corporate chains themselves), and the threat of more powerful and militant unions in chain store retailing.

Those corporate chains that apparently have determined to preserve their corporate structures attempted to meet these restrictive influences during the year, in the main, by:

- (1) Weeding out unprofitable units and reducing the number of "neighbourhood" locations.
- (2) Developing different types of super-market operations involving:
  - (a) A concentration into larger stores often located where land is cheap or rentals are low but where ample parking space is available.
  - (b) Operation, wholly or partially, on a serve yourself, cash and carry basis.
- (3) Expanding chain owned or controlled manufacturing, processing, and packaging departments.
- (4) Experimenting with "Point of Sale" advertising programs offered to suppliers on a standardized basis and with the sale of "space" in consumers' magazines published by the chains.
- (5) Organizing to oppose adverse legislation by actively co-operating with agricultural producers and manufacturers, by improving corporate chain labour relations, and by establishing closer contact with the consuming public. (These efforts had an effect in Maine, a State that repealed its chain store tax. In Florida, too, the co-operation of the citrus growers with the corporate chain largely helped to defeat the drastic anti-chain "Recovery Act.")

During the year, to be sure, some corporate chains converted their organizations, partially or wholly, into "voluntary" associations. Some limited their 1937 expansion to the addition of independently-owned "associate" stores. Such conversions and expansions, however, were not significantly numerous.

The publication, early in 1937, of the Census of Business for 1935 made it possible to compare the 1935 status of the corporate chain in the United States with the year 1929 and with the year 1933, the years of the two preceding censuses of distribution. In 1929, the corporate chains secured 20.0% of the total volume of retail sales, in 1933 they increased their share of the total to 25.4%, and in 1935 they fell off to 22.8%. While the volume of corporate chain sales increased in 1935 over 1933, that increase was less than the increase in the volume of the independents. Comprehensive and proportionate data for 1937 is unavailable. However, for the first 11 months of 1937 the average volume for all corporate chains was 9.8% greater than for the comparable period in 1936.

Detailed and authoritative data pertaining specifically to corporate chain stores or "multiple shops" in Great Britain are unavailable. However, the British National Chamber of Trade lumps together the "co-operative" and the "multiple" store and puts their combined number at ten in every 100 of about 1,000,000 retail establishments. The accepted proportion of the total retail business in Great Britain done by the co-operative and the "multiple shop" is not less than 30%.

A growing British opinion has been evident to the effect that the "multiple shops" are diverting trade in increasing amounts from the independent retailer and that the future of private trading is a political problem. This opinion became articulate in 1937 in the discussions of the shops (Retail Trading Safeguards) Bill which was introduced into the House of Commons by Captain Balfour and which specified a census of all shops, and the establishment of three Retail Trade Commissions to issue licences to all "multiple shop" systems numbering more than six stores under common control. The Bill made little progress toward enactment. (See also RETAIL SALES.) (G. R. C.)

**Chamberlain, Arthur Neville** (1869— ), British statesman, son of Joseph Chamberlain; entered Parliament 1918, and the Cabinet in 1922; Chancellor of the Exchequer 1923–24 and from 1931, till he became Prime Minister on the retirement of Mr. Baldwin (q.v.) on May 28, 1937. A biographical notice of him is in the *Encyclopædia Britannica*, vol. 5, p. 201. His accession to the premiership involved no change of policy, but a number of changes were made in the ministry (see CABINET MEMBERS: Great Britain), and the First Commissioner of Works ceased to hold Cabinet rank.

As Chancellor of the Exchequer, Mr. Chamberlain introduced his sixth budget (see GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF: *Banking and Finance*) on April 20; this was chiefly remarkable for the sections relating to the National Defence Contribution (N.D.C.), which was so severely criticized in the city and elsewhere that on June 1, as Prime Minister, Mr. Chamberlain announced their withdrawal and their replacement by a simpler profits tax on similar lines that would produce at least an equal revenue.

On May 31 he was unanimously elected leader of the Conservative Party, at the annual conference of which he made an important speech (Oct. 8), in which he dealt with the unsettled state of Europe, welcomed President Roosevelt's declaration of the necessity for a return to a belief in the pledged word and the sanctity of treaties as evidence of America's willingness to co-operate in the restoration and maintenance of peace, and emphasized the necessity for Britain's rearmament. On June 25, in the House of Commons, he made his first important speech, as Prime Minister, on foreign affairs, and on July 3 visited his constituency and explained to the Birmingham Conservative Associations the main points of his policy, which, he said, were: to keep the peace, to ensure that Britain would be so strong as to be universally respected, to increase trade, employment, and prosperity, and to carry on and improve the social services. At the end of July his

exchange of personal letters with Signor Mussolini did much to clear the atmosphere in regard to Anglo-Italian relations.

On Nov. 9, at the Guildhall banquet, Mr. Chamberlain, besides speaking of the situation in Spain, Britain's relations with the "Berlin-Rome axis," and "the really astonishing economic progress which has been made by the world as a whole since the dark days of 1932," mentioned that the essential factor for success in any endeavour to bring about a settlement of the Sino-Japanese dispute was the co-operation of the United States, and that he was now engaged in informal discussions with a view to the eventual conclusion of an Anglo-American trade agreement, negotiations towards which, he announced in the House of Commons on Nov. 19, were making progress.

**Chamberlain, Sir (Joseph) Austen** (1863 – 1937), British statesman whose fame rests mainly upon his service as Secretary of State for Foreign Affairs from 1924–29, the story of which is included in the account of his career in the *Encyclopædia Britannica*, vol. 5, p. 201. One of the most influential Conservative members of the House at the time of his death in London on March 16, 1937, he was largely responsible for forcing Sir Samuel Hoare to resign as Foreign Secretary in Dec. 1935, upon disclosure of a Franco-British plan to appease Italy with virtual possession of half of Ethiopia. In 1935 also, he was the author of an autobiography, *Down the Years*.

**Chambers of Commerce.** In 1937 chambers of commerce continued their evolution as part of the American business and social machinery. In the United States today there are about 2,000 organized chambers of commerce, besides other organizations that operate somewhat similarly.

They are financed usually by voluntary subscriptions or membership fees. Their budgets, varying widely, will average about forty cents per capita. Staffs range from one man and a stenographer in smaller communities to a general manager and numerous department chiefs in larger centres. Chambers of commerce originally were concerned primarily with the exchange of commodities, the price of goods, transportation and the laws of trade. But as American cities grew they became civic organizations as well as business promoters. During the World War they extended their activities as also in the depression of 1929. Significant in 1937 was the adoption by many chambers of policies respecting industrial relations. These policies were not in opposition to organized labour or in support of management; they were directed at the preservation of industrial peace in the public interest. (H. S.)

**Great Britain.**—Great Britain in 1937 numbered 107 chambers associated with the central body, the Association of British Chambers of Commerce whose president for the year was Sir Geoffrey Clarke, C.S.I., O.B.E. The membership of the affiliated chambers in 1937 was 45,608.

**Channel Islands.** A group of nine islands off the Norman coast, in British possession, administered by lieutenant-governors appointed by the Crown, and by local, mainly elected, parliaments called "States." Jersey, the largest, has a separate administration; Guernsey has jurisdiction over Alderney, Sark, Herm, and the rest. Capitals: (Jersey) St. Helier, pop. 25,824; (Guernsey) St. Peter Port, pop. 16,720.

**Area and Population.**—Area: 75 sq.mi. (Jersey, 28,717ac.; Guernsey, 15,654ac.; smaller islands, 3,712ac.). Pop. (census 1931): Jersey, 50,462; Guernsey and dependencies, 42,743.

**Religion, Language, Education.**—The islands form two dean-

NEVILLE CHAMBERLAIN, prime minister of Great Britain

eries of the Anglican diocese of Winchester. The official language is French, still largely spoken locally; but English is everywhere understood, and may be used in the states. Education is carried on by public instruction committees on lines similar to the British; the principal educational institutions are Victoria college (Jersey) and Elizabeth college (Guernsey).

**Industry, Communications.**—The main industry is agriculture—fruit, potatoes, flowers, etc., being produced on small holdings. About 43,000 ac. are cultivated. Guernsey and Alderney dairy cattle are famous. Trade is almost entirely with Great Britain to which agricultural produce and granite are exported. The service on the Jersey railway is suspended. Jersey and Alderney have airports, and Jersey is linked by regular air services with Alderney, Southampton, and London.

**Finances, etc.**—Both Jersey and Guernsey mint their own copper coinage; otherwise British imperial currency is used. In Guernsey the state and banks issue their own £1 and 10s. notes. Taxation is very low. In 1936 the revenue of Jersey was £441,582, and its expenditure £429,615; those of Guernsey (1935) £567,695 and £497,273 respectively. The total debt of the islands is about £2,666,000. Service in the local militias is compulsory for adult males.

**Chautemps, Camille** (1885– ), French statesman; born in Paris; was an advocate before the Court of Appeal from 1904; Radical-Socialist deputy for Indre-et-Loire, and later Loir-et-Cher, and from 1933 senator for the latter department. In the Herriot cabinet of 1924 he was minister for the interior; in 1925–26 minister for the interior and for justice; and prime minister, for twenty-four hours, in Feb. 1930. In the Steeg cabinet of 1931 he was minister for public instruction, and again of the interior in the governments between June 1932 and Nov. 1933, when he again became prime minister until the following Jan. 27, his government being then overthrown as a result of the Stavisky affair. In the Sarraut government of Jan. 1936, he was minister for public works, and in M. Blum's government, formed in June of that year, minister of state. On M. Blum's fall in June 1937, he formed a ministry with a mandate to effect extensive economies and rescue France from a dangerous budgetary situation. In Nov. 1937 he paid a short visit to London, with his foreign minister, M. Delbos, to exchange views on the international situation with the British ministers.

**Cheese.** Production of cheese in the United States in 1937 was estimated by the U.S. Department of Agriculture at 473,531,000 lbs., a decline of 14,045,000 lbs., or 3% below 1936, but the second largest output on record. Wisconsin produced about 60% of the total. There were declines in older cheese-manufacturing states, but a general increase in production throughout the South, especially in Texas.

Cheese production in the United Kingdom in 1937 was 771,900 cwt., compared to 1,087,400 cwt. in 1936. Factory output declined during 1937, but farm production increased. British imports for the year were 2,937,000 cwt. (2,994,000), figures in parentheses being for 1936, valued at £9,257,000. Ninety per cent of imports were from Empire countries, New Zealand accounting for 1,731,000 cwt. (1,681,000); Canada for 722,000 cwt. (603,000); the Netherlands for 217,000 cwt. (182,000). British cheese consumption per capita in 1937 was 8.6 lbs.; in 1936, 8.8 lbs.; in 1935, 9.1 pounds. Per capita consumption in the United States remains about 5.5 lbs. while in Switzerland it is four times that amount, nearly three times as much in Denmark and Holland and about twice as much in France, Germany, Italy, Sweden and Norway.

Almost every country in Europe and North America is both an

importer and an exporter of cheese, exporting native varieties and importing foreign varieties. Total export in the world cheese trade for the 10 months ending Oct. 31, 1937, was estimated by the International Institute of Agriculture at 509,438,000 lbs. compared to 462,366,000 lbs. in 1936, while imports were, respectively, 502,305,000 and 454,693,000 pounds. New Zealand was the largest exporter, 148,405,000 lbs. (144,965,000), figures in parentheses being for the corresponding 10 months in 1936. The Netherlands was second in exports, 115,362,000 lbs. (103,223,000). Other leading exporters were for the 10 months: Canada, 71,417,000 lbs. (60,581,000); Italy, 44,073,000 lbs. (31,800,000); Switzerland, 32,185,000 lbs. (35,140,000); France, 20,331,000 lbs. (18,953,000); Denmark, 17,344,000 lbs. (17,970,000); United States, 977,000 lbs. (955,000). Germany in the 10 months ending Oct. 31, 1937, imported 66,668,000 lbs. of cheese; the United States, 49,712,000 lbs.; Canada, 1,063,000 lbs.; France, 24,560,000 lbs.; Switzerland, 2,848,000 lbs. (S. O. R.)

**Chemical Warfare.** Chemical warfare comprises the use in war of what are popularly known as "poison gases," though there are liquids giving off vapours usually included in that term which are not, strictly speaking, gases at all. For the sake of clearness they will all be described in this article as "war gases." Their use in war is not altogether an innovation. The Spartans used pitch, sulphur, and burning charcoal to irritate the defenders in the siege of Plataea in 429 B.C., and the use of stink bombs was not unknown in the Middle Ages. The possibility of the use of war gases was sufficiently apparent for it to be prohibited by the Hague Conventions of 1899 and 1907. The Prohibition, and the wide and devastating effect, quite unforeseen by the German high command, alike account for the indignation and consternation aroused by the German use of chlorine in the Ypres salient in April 1915. Most of the important countries of Europe, including Great Britain, adhered to the Geneva Gas Protocol of 1925, which again prohibited the use of war gases; but they all include their manufacture in their armament programs.

War gases are, broadly speaking, of four kinds: lung irritants, tear gases (or "lachrymators"), nose irritants (or "toxic smokes"), and blister gases (or "vesicants"). There may also be included under the category of war gases certain gases which directly attack the nervous system, the most important of which is hydrocyanic (prussic) acid gas, a high concentration of which will kill its victim in about two minutes. A respirator is a complete protection against this gas. The war gases must be classified under two further heads, as either "persistent" or "non-persistent." The latter vaporize on the burst of the projectile containing them, and conditions of high wind, heavy rain, thick fog, or hot sun are all unfavourable to their use. The former are vapours given off by liquids with a high boiling-point. War gases are discharged by shell or projector bombardment, by bursting grenades, and from air-ships or aeroplanes either by bombs or by sprayers.

The lung irritants, chlorine and phosgene, are true gases, and therefore non-persistent. They are stored in liquid form and vaporize on release of pressure. They are heavier than air, chlorine two-and-a-half times so, phosgene three-and-a-half. Chlorine has a choking smell, irritates the eyes and respiratory organs, and frequently leads to bronchitis or pneumonia. Phosgene is five times more lethal than chlorine, and therefore is likely to supersede it for future use. Phosgene has a faint smell of musty hay; and it tends to work its way down into cellars and dug-outs. It attacks the eyes and respiratory organs, like chlorine, but with far worse effects; its action is delayed, a deceptive period of well-being intervening between the attack and its re-

sults. The respirator affords complete protection against the lung irritants.

The three types of tear gas are virtually harmless except for their temporary effects; they used to be dangerous, in that they penetrated respirators and caused the victim to remove his respirator, so leaving him unprotected against more harmful gases. But the modern respirator affords complete protection.

There are three types of nose irritants, all compounds of arsenic and highly poisonous: they produce burning pains in the nose, throat, and chest, followed by acute mental depression. With these, again, the respirator gives complete protection.

The blister gases are mustard gas and Lewisite. The former, when in liquid form, is either crude, and dark brown in colour (as used in the Great War), or pure, and pale straw-yellow. It is both persistent and insidious, the vapour having a faint smell only. In its liquid form it sinks into the skin, and causes severe blistering, which is very difficult to heal and readily becomes septic. In the eyes it causes conjunctivitis and often complete blindness. The vapour is less severe in its effects, but a high concentration has very serious results, and if inhaled there is a danger of broncho-pneumonia. Lewisite is colourless when pure, and brown in its crude state. The vapour is invisible, but with a strong smell of geraniums. The liquid has quicker and somewhat more severe results than mustard gas, but is readily destroyed by water or alkalis. With the blister gases the respirator alone does not afford complete protection, but oilskin clothes and rubber boots are also necessary.

The blister gases constitute the most serious danger of chemical warfare. They are persistent—especially mustard gas; they are most severe in their results; they contaminate food supplies; and they penetrate nearly every material except glass, porcelain, and unglazed metals. It is impossible to work except for very short periods in protective clothing, and decontamination, which can be effected by weathering, sealing, destruction, or removal, requires great care, and in the last cases great skill. While soap and water in each case, and chlorine (in a bleach paste) in the case of mustard gas, if used in time, can remove or destroy the poison on an individual victim, successful treatment must involve clear thinking and self-control, probably in the midst of a panic. The nature of the protective clothing, and the fact that it is impossible to speak or eat in a gas mask must impede all normal activities, and while it is perfectly possible to make rooms gas-proof, the incendiary bomb may make their occupation impossible. While, therefore, mustard gas in particular may be most useful in keeping the enemy out of an area in military operations, the real terrors of chemical warfare are reserved for its use against the civilian population. (See also *ARMIES OF THE WORLD: Chemical Warfare*; *CIVIL POPULATION, PROTECTION OF*; *MUNITIONS OF WAR: Chemical Warfare*; *WARFARE*.) (W. T. WE.)

**Chemistry.** The extent and detail of the publication of results of scientific investigations are among the striking phenomena of modern civilization. In chemistry, alone, there appeared in 1937 a fifth of a billion words which were found worthy of systematic abstracting. This material was published in about two thousand scientific journals throughout the world. More than ever is it evident that science knows less of international boundaries than does any other human activity. These two hundred million words on chemistry in a single year do not include books, reviews and summaries of known material, or patents. The mass of publication of new material in chemistry becomes still more significant when one considers that most of it has been condensed and compressed before publication because of the pressure on nearly every chemical journal in the world. A review of this material in two thousand words would allow one

word in this article for two hundred thousand words published during 1937 on chemical research. Obviously this would require an impossible degree of selectivity. The selection of important commercial developments is difficult enough but the selection of the truly important fundamental chemical achievements of a single year is impossible. The important developments of 1937 may not be recognized for years and the ones which seem interesting now may fail to be fruitful.

In attempting the impossible in this article, no effort will be made to indicate individual or national achievements. More than ever science is a team activity in which the work of every scientist depends on and influences the work of every other scientist. Moreover, science is really without national boundaries, even during a time when the primitive desire for national self-sufficiency has drafted the services of all the sciences, especially chemistry, that science which deals primarily with the changing of one material into another. A scientific secret is practically an impossibility. The mere knowledge that a thing has been done is usually enough of a clue to make possible its accomplishment by other scientists. The artificial subdivisions of science come closer together each year; hence this article will not attempt any separation of chemistry into its classical subdivisions.

**Atom-Smasher.**—New methods and tools properly catch the attention. The cyclotron or atom-smasher is properly described in the article on physics, although its results are of great interest to chemists. It gives the modern achievement of the ancient alchemical dream of converting one element into another, even though the newly found laws of such transmutations preclude the conversion of base metals to gold. Radio-sodium, a product of the cyclotron, is finding application as a substitute and supplement for radium in therapy. Radio-titanium has been added to the artificially radio-active elements. It has been possible to build up elements Nos. 93 and 94 by bombardment of Uranium (No. 92) with neutrons. The discovery of element No. 87 has again been announced, this time with the name of Mavadium instead of Virginium. (See also *MATTER, STRUCTURE OF*.)

Improvements in the methods for the all-important study of the composition of materials have continued. The separation between inorganic and organic methods and reagents in the analytical field is disappearing. Micro methods have continued to become more general during the year. In fact, macro methods in many fields are already falling into disuse. This is not merely because of the economy of material which was the original incentive for micro methods but because of their saving of time. The influence of these methods on the whole of chemistry can hardly be over-estimated. The polarograph has been revived for the purpose of analyzing complex mixtures of organic compounds. The iridescent properties of thin sections of ores have been applied to their rapid analysis.

Large scale molecular distillation has become important not only commercially but as a means of supplying hitherto rare materials in amounts sufficient for research. The increased use of highly refined fractional distillation methods has continued. The difficult problem of the composition of petroleum is gradually yielding to them and to the related methods of modern counter-current solvent extraction.

**Isotopes.**—The study of isotopes advanced rapidly during the year. Deuterium atoms have proved to be valuable tracers for following the course of chemical and bio-chemical processes, for instance, the formation and deposition of fats in animal organisms. The stereochemistry of deuterium compounds has been opened up. Further concentrations of the isotopes of oxygen and nitrogen have been achieved. The heavier isotopes of oxygen are more plentiful in rocks than in air and water. Heavy nitrogen will be a tracer for following the bio-chemistry of amino acids and pro-

teins. (See also ISOTOPES OF THE LIGHTER ELEMENTS, SEPARATION OF.)

Mathematical tools and related experimental techniques have been further developed. Their application to the 17-body system in the highly symmetrical neopentane molecule has been striking. Notable theoretical advances have been made in reaction kinetics, in the knowledge of optical rotation, in lyophobic colloids, and in viscosity. Important experimental refinements have also been developed in the latter field. Studies of the properties of simple molecules at very low temperatures have revealed new generalizations. Perhaps the most important of these deals with the lack of free rotation in molecules as simple as ethane. Insoluble monolayers of sterols and proteins have been studied with the development of new knowledge of molecular properties. Very accurate studies have been made of the dielectric properties of solids. The heats of hydrogenation and free energies of olefins and related compounds were determined.

The new tool of electron diffraction has given added knowledge of inter-atomic distances, especially of the C-C distance as it is influenced by other atoms. The somewhat older tool of the Raman spectrum has continued to give valuable results on even as simple a substance as water. In organic chemistry, one of the most general reactions is that involving carbonyl oxygen and alpha hydrogen. New studies of this old reaction have progressed slightly. The absence of electromers in the pentaenes has been demonstrated. Further work has been done on the mystery of molecular rearrangements, those strange reactions in which it is easier for a molecule to undergo an internal change than to limit itself to the external change on which the chemist has focused his mind.

**Catalysis.**—Catalysis has been further extended in the hydrocarbon field, including catalytic cracking, polymerization, and the new reaction involving the addition of a paraffin to an olefin. Sodium has been cheapened. Its use in organic reactions has been facilitated by the adaptation of various complex ethers as solvents. The clean cleavage of carbohydrates by periodic acid has been announced. Further applications were developed for the Diels-Alder reaction, probably the only distinctly new general reaction developed in organic chemistry in a decade. Ethylene, from cracking operations, continued as an important raw material for organic syntheses. The old reaction of chlorine with olefins to give substitution instead of addition was revived to make allyl chloride and methallyl chloride, potentially important raw materials for the resin industry. Old and new organic compounds of fluorine became available in large number.

The nature and origin of coal were further studied. No similar studies of petroleum were pushed except that clues may be given by differences in crude petroleum from different formations. These differences are becoming more evident as modern methods of distillation and solvent extraction are being applied. Cellulose has been further recognized as one of man's most important renewable raw materials. Increasing but still inadequate studies were made during the year.

**Resins.**—Resins continued to absorb much effort. Improvements were made in raw materials such as styrene and the methacrylates. Perhaps the most spectacular development in the resin field was the production of two resins, one of which adsorbs anions and the other cations from solution. Thus, at long last, is realized the one unfulfilled prophecy of Francis Bacon, the possibility of "straining salt from sea water."

Progress in the chemistry of materials related to life continued unabated. Surprising unities among these materials have been developing during the past few years. The nature and relationships of the sterols, both animal and vegetable, were greatly clarified. Related polynuclear compounds were extensively studied, especially as to their carcinogenic properties. The chemistry of the

products of the tubercle bacillus advanced decidedly during the year. The knowledge of plant products including their colouring materials and their alkaloids progressed slowly. The chlorophyll problem advanced somewhat. It was found that the alkaloid, colchicine, has the remarkable power of doubling the number of chromosomes in certain plants. Hydroxyethyl-apocupreine was further applied in the treatment of pneumonia.

The crystalline giant proteins related to virus diseases were further studied, as were the vitally important amino acids and their relation to proteins. The importance of having pure crystalline products for study has been exemplified by the crystallization of catalase and of vitamin A.

**Vitamins.**—Developments in the vitamins went on apace. The most notable among many notable achievements was the climaxing of a 25 year study of the antineuritic vitamin ( $B_1$ ) by its laboratory and commercial synthesis within the year. The relation of vitamins  $B_1$  and  $B_2$  to enzyme actions and the multiple nature of vitamin D were studied. The difficult problem of the fertility vitamin (E) was further advanced and a new vitamin (P) related to cell permeability was discovered. The importance of the vitamin field is evidenced by the award for 1937 of two Nobel Prizes to Szent-Györgyi and to Karrer and Haworth for work related to vitamins C and A. (See also VITAMINS.)

Studies of hormones continued with special emphasis on the sex hormones which have been such prolific sources of new organic chemical studies in the past few years. A new male hormone, epiallopregnanolone, was isolated and synthesized. At least two new hormones of sexual activity have been isolated from the adrenal glands. Enterocrinin, a new digestive hormone, was isolated.

Among high molecular weight natural products the visual purple of the retina was found to have a molecular weight of about 800,000. The highest speed super-centrifuge was still further refined and a less expensive model was adapted for general laboratory use. The extension of this important research tool will speed up the study of giant molecules. The yellow respiratory enzyme was further studied. Work was continued on the complex sapogenins.

**The Elements.**—The chemistry of the 90 elements other than carbon is due for a revival. Inorganic fluorine compounds became more prominent during the year, largely because of their relation to phosphate rock and to drinking water. Carbon dioxide was introduced into day-light incandescent lamps. Bearings of less usual metals such as silver and cadmium were introduced with mixed results but a net increase in the knowledge of such problems. Even the old subject of the composition of the atmosphere was restudied as was the newer one of the isotopic composition of natural waters.

The year saw great expansion in chemical research facilities in practically every country. Perhaps the outstanding event in this line was the dedication of a veritable temple of research, the new home of the Mellon institute in Pittsburgh, Pa.

With the growing complexity of chemistry and with its development of new experimental and mathematical techniques, an increasing number of adequately trained apprentices for the science is needed. The year 1937 gave every indication that the field of chemistry is as attractive as ever and offers opportunities to all who have the ability and energy to serve so exacting a task mistress. (See also CHEMISTRY, APPLIED.) (F. C. WH.)

**Chemistry, Applied.** The order in which advances in applied chemistry are noted is not to be taken as signifying their relative importance. In most instances it is still too early, Jan. 1, 1938, to know really which will prove of greatest significance.

The commercial development of high-vacuum molecular distillation, enabling the production of vitamin A concentrates from

fish liver oils and the application of the same process for the separation of many other substances was important. In addition to high vacuum which can be maintained in modern welded apparatus, the separation of the heating and cooling surfaces of the mechanism with respect to the size of the molecules to be separated is a unique feature. There has been put into operation the first large-scale commercial unit practising electrolytic reduction of organic compounds. At present tonnage quantities of hexahydric alcohols from glucose are being produced and these products are important as raw materials in the production of vitamin C, beside having applications in the printing and textile industries. (See VITAMINS.) Research has overcome objectionable colour heretofore a characteristic of sweet potato starch and has also showed how sweet potatoes may be stored, with the result that a factory began commercial operations. The resulting starch competes directly with cassava, heretofore imported, and the operation offers a beneficial outlet for surplus or unmarketable sweet potatoes. For many years the entire output of the world's only tantalum mine in Australia has been used by an American producer of this important metal. Improvements in methods for concentrating the ore have made it possible to use a considerable deposit in the Black Hills of South Dakota and this is now being mined, concentrated, and used as an additional important source.

A new plant began operations for the production of elementary phosphorus from phosphate by a new electrolytic process. This important element in highly purified form is being shipped in tank cars and becomes the starting point for the manufacture of high-grade phosphoric acid and many compounds of this element. In Canada the capacity of the plant refining radium-bearing ore has been trebled and the output of radium has served to reduce the price of the element imported into the United States to below \$30 per milligram. A new electrothermal process for refining magnesium is reported to yield this lightest of metals at a cost below that of aluminium. In Europe there has been a quickened interest in synthetic rubberlike materials. New types of buna rubber made in Germany were manufactured and the rate of production for 1938 has been set at 20,000 metric tons. In Italy government subventions for the development of synthetic rubber were announced, as were similar plans in Czechoslovakia. In the United States one of the synthetic rubberlike materials, neoprene, was produced to an amount of over 1,500,000 lbs., and another type available in several varieties, thiokol, was produced in increasing quantities.

Important developments in the utilization of cracking gases from petroleum and natural gas saw the commercial establishment of polymerization processes whereby olefines yield polymers of gasoline character important for their high anti-knock value as well as a long step toward conservation of petroleum products. Iso-octane, heretofore relatively rare and used only as a standard for measuring anti-knock values, was produced in commercial quantities for aviation. The quantity produced in 1937 was about 2,000,000 gallons. Refinery gases as a source of acetone became a factor of serious disturbance in the acetone market, and new solvents produced from ethylene and similar hydrocarbons were placed upon the market. New processes for the recovery of carbon dioxide from the flue gases of power plants were put in operation with a view to increasing the output of dry ice and other developments enabled the removal of sulphur dioxide from such gases, thus decreasing the pollution of the atmosphere and yielding elemental sulphur as a valuable product.

To the growing family of synthetic resins and plastics 1937 saw added styrene characterized by clarity, low initial colour, and thermoplastic properties, as well as improvements in the acrylic and metacrylic resins. Improved technique in the use of resins

for large mouldings saw the material enter the field of large radio cabinets and lighting fixtures. New types of vinyl resins were developed and a plant erected with a view primarily to improving safety glass, particularly as regards plasticity at very low temperatures. Various resins, especially those of the glyptal type, found more extensive use in lacquers and enamels, aided by additional improvements in pigments of the titanium type.

Extensive experiments and tests nearing completion demonstrated that a new type of rayon fibre retains its strength at the high temperatures developed in truck and bus tires, giving it an advantage over most cotton cords. The mileage with such tires is very greatly increased over those usually employed. The same type of fibre with as many as 390 filaments per thread composed the 4,000 sq. ft. quadrilateral jib of the "Ranger" and was a factor in the success of that American Cup defender. Ethyl cellulose made its appearance as a wrapping material. (See also RAYON.)

In Germany following experiments with a pilot plant a large commercial unit for the production of synthetic fatty acid was completed and put in operation. The output will be used solely for technical purposes, particularly in the manufacture of soaps, thereby conserving vegetable oils and fats. Both abroad and at home advances were made in detergents which suppress the formation of insoluble calcium and magnesium salts, which are present in hard waters, and also of wetting agents which possess extraordinary penetrating, spreading, emulsifying, and wetting-out properties of importance wherever aqueous solutions are used, as in the textile industry. Encouraging progress was made in the effort to perfect insecticides and fungicides to replace lead and arsenate, objectionable in those instances where spray residues can be removed only with difficulty. The new materials come principally from the field of synthetic organic chemistry.

Research in the difficult field of vitamins and hormones has borne fruit in applied chemistry with the commercial synthetic production of vitamin B<sub>1</sub> and similar syntheses of certain hormones.

Translucent laminated plastic readily formed and fabricated in any ordinary punch press made its appearance for use in instrument dials and lighting fixtures. Success rewarded the efforts to use submerged moulds for the production of calcium gluconate and sorbitol with lactic acid and other materials ordinarily fermented in shallow pans. The use of a revolving drum for these moulds has made them as available for commercial processes as are yeasts and bacteria.

Chemistry has come to the aid of the textile industry in providing new fast colours and permanent water-repellent finishes for all types of cotton and linen fabrics, a new crush-proof process for rayon-pile velvets which are made resistant to spotting by the use of the water-repellent finish referred to above, new sizes, and the use of synthetic resins in textile finishing.

Turpentine is now dehydrated to remove the free water which caused rusting of containers and subsequent discolouration of turpentine. Fertilizers have been granulated to prevent caking in storage and improved drillability, and new compounds high in nitrogen and other elements and designed to be low in equivalent acidity have been manufactured. While there seems to be evidence that the list of new processes and materials introduced in a given year is shorter in times of relative prosperity than in depression, the contributions of 1937 are in many instances notable nevertheless.

(H. E. H.)

**Chemistry, Institute of.** The membership roll has increased by over 200 to nearly 7,000. Local sections, of which there are over 20 in Great Britain and the Dominions, have been busy, and many valuable papers have been read and published in the *Journal*. Lectures published

from headquarters include "Gas-defence from the point of view of the chemist" and "Chemical changes and chances." Among matters to which the council has directed special attention are teaching of general science in schools and a means whereby a form of voluntary registration for qualified chemists (other than pharmacists) may be effected. The Institute completed its 60th year.

## Chemotherapy.

Chemotherapy deals with those chemical compounds which exhibit a greater toxicity for specific parasites than for the tissues of the hosts in which such parasites are found. The evaluation of chemotherapeutic remedies depends on (1) the production of a series of chemical compounds; (2) a study of the pharmacology, toxicity, and therapeutic activity of these compounds in experimental infections in animals, with determinations of chemotherapeutic indices, and (3) investigations of the therapeutic activity and toxicity of these compounds in natural infections in man and in animals. It is obvious that such investigations must extend over considerable periods, especially with diseases of long duration, such as syphilis and sleeping sickness.

In the treatment of syphilis, a number of new ter- and quinquivalent arsenical compounds have been studied, but no important advances have been made. Among a homologous series of derivatives of *p*-aminophenylarsonic acids of the general formula  $(\text{HO})_2\text{AsO}\cdot\text{C}_6\text{H}_4\cdot\text{NH}\cdot\text{CO}\cdot(\text{CH}_2)_n\cdot\text{CO}\cdot\text{NR}_1\text{R}_2$ , prepared by Morgan and Walton (1931), sodium succinylmethylamide-*p*-arsonate ( $n=2$ ;  $\text{R}_1=\text{H}$ ;  $\text{R}_2=\text{CH}_3$ ) has been shown to have curative effects both in neurosyphilis and in primary and secondary syphilis.

This compound "neocryl" has also been found effective in clearing up symptoms in African sleeping sickness (trypanosomiasis); it is as yet too early to determine whether it is superior to tryparsamide (Murgatroyd, 1937). Morgan and Walton (1937) have shown that trypanocidal action is enhanced by an amide group in the *p*-position in phenylarsonic acid. In 1935, Jancsó and Jancsó and Schern and Artagaveytia-Allende found that synthalin (decamethylenediguanidine) exerts a curative action on mice infected with various pathogenic trypanosomes. This observation has been confirmed by King, Lourie, and Yorke (1937), who have studied the action of a number of synthetic guanidine and related compounds, of which undecanediamidine appears to be the most active therapeutically in laboratory animals.

The most important chemotherapeutic advance during 1937 has involved the clinical exploitation of the discovery made by Domagk (1935) that azo-compounds containing the sulphonamide group ( $-\text{SO}_2\text{NH}_2$ ) possess a curative action in streptococcal infections in mice and rabbits. The first compound prepared, 4-sulphonamido-2': 4'-diaminoazobenzene (prontosil) was introduced in the form of a hydrochloride: it is sparingly soluble in water and is given by mouth.

Tréfouël, Nitti, and Bovet (1935) showed that the essential part of the molecule is the benzene nucleus containing the sulphonamide group in the *para*-position to an amino group, and *p*-aminobenzenesulphonamide proved to be highly active against haemolytic streptococcal infections.

Under the names "sulphonamide-P" and "sulphanilamide," this is now being extensively used. As might be expected, many derivatives of this simple substance have been made, of which a few have come into clinical use. These compounds have been successfully employed in the treatment of haemolytic streptococcal infections, particularly puerperal fever (of which the mortality has been reduced), chronic streptococcal lesions, and erysipelas. Infections due to *Streptococcus viridans* are relatively unaffected. In streptococcal meningitis, and to a less extent in meningococcal infections, good results have been obtained. Cures have also been reported in experimental animals and, to a limited extent in man, of pneumococcal infections, especially those of Type III, and of gas gangrene. In gonococcal and staphylococcal infections the results have been less satisfactory than in diseases due to the haemolytic streptococcus. A large number of other compounds have now been prepared which are highly active in laboratory animals infected with streptococci, pneumococci, gonococci, and staphylococci. These compounds await clinical trial. Their method of action is at present uncertain: as they are weak antiseptics their action on the organisms is slight and growth only is delayed; the defence mechanism of the body is unimpaired.

Arising out of this work Buttle, Stephenson, Smith, Dewing, and Foster (1937) in England have shown that in laboratory tests 4:4'-diaminodiphenylsulphone is a much more active streptococcal agent than sulphanilamide, but unfortunately more toxic. In France di-(*p*-acetylaminophenyl)-sulphone and 4-nitro-4-amino-diphenylsulphoxide have been used with success in the treatment of gonorrhoea. Sulphanilamide has also been employed in cases of infections of the urinary tract due to *Bacterium coli* and in one case of infection with *Bact. typhosum*. Toxic reactions have been described as a result of the use of these substances, more especially prontosil and sulphanilamide. Reactions are not common; the most frequent are nausea, vague abdominal discomfort, diarrhoea, headache, disorientation, choking or drunken feelings, acidosis, fever, cyanosis, methaemoglobinemia, and sulphaemoglobinemia. Less common complications are acute haemolytic anaemia and anginal agranulocytosis. Some degree of polychromasia is almost always present, while excretion of porphyrins in the urine and faeces is increased. Optic neuritis has occurred, and skin rashes, either morbilliform or maculo-papular in type, possibly due to photosensitization, have been recorded. Exfoliative dermatitis is rare.

## Chess.

The outstanding event of the year 1937 in the chess world was the recapture of the world championship title by Dr. Alexander Alekhine, the first occasion in the history of the championship when such a "come-back" has been made. Alekhine was champion from 1927—when he defeated Capablanca, the holder since 1921—until his defeat by Dr. Max Euwe in 1935; in 1937 he challenged Euwe, and the match took place in various towns in Holland between October 5 and December 16, 30 games being played, the winner to be he who first scored 15½ points. Alekhine won 11 games, Euwe 6, and 13 were drawn.

After the match Dr. Euwe announced that, if his subsequent tournament play warranted it, he might make an attempt on the title in four or five years. In August the International Chess Federation decided that Salo Flohr, of Czechoslovakia, would be the next challenger.

The following are the results of the more important international and other tournaments held during the year: At Hastings (ended January 6), Alekhine (France) attained first place with a score of 8 points out of a possible 9; Reuben Fine (U.S.) was second, and E. Eliskases (Austria) third. Others to be placed were, in this order: Dr. Vidmar (Yugoslavia), M. Feigin (Latvia), T. H. Tylor and W. Winter (Great Britain), G. Koltanowski (Belgium), Miss Menchik (Czechoslovakia), and Sir George Thomas (Great Britain).

At the third annual Easter Congress at Margate, first place was shared by P. Keres (Estonia) and R. Fine; Dr. Alekhine came second, and J. Foltys (Czechoslovakia) third.

In July, an international tournament was held at Kemer, Latvia, Great Britain not being represented. This resulted in a triple tie, Reshevsky (U.S.), Petrov (Latvia), and Flohr (Czechoslovakia) each winning 12 points, to the 11½ of Dr. Alekhine and Keres and the 11 of Steiner (Hungary). Later in the month the match between Miss Menchik and Miss Sonja Graf was held at Semmering, and was won by Miss Menchik by 11½ points to 4½, her challenger winning only two games.

The sixth international team tournament for the Hamilton-Russell Cup was held at Stockholm, July 31–Aug. 14; 19 countries took part, and for the fourth time in succession the cup went to the United States, their team consisting of R. Fine, I. Horowitz, I. Kashdan, F. J. Marshall, and S. Reshevsky. Hungary was second, and Poland and Argentine equal third; the British Empire finished thirteenth. Miss Menchik retained her world women's championship, winning all her 14 games.

The last international meeting of the year was held at Semmering and Baden, near Vienna, September 8–27, Dr. Euwe acting as umpire; the first prize went to Keres, of Estonia, with 9 out of a possible 14 points; Fine (U.S.) was second with 8, and Capablanca (Cuba) and Reshevsky (U.S.) tied for third with 7½. At the Hastings Congress that opened on December 28, Reshevsky won first prize in the premier tournament, Keres and C. H. O'D. Alexander were bracketed second, and Flohr and Fine fourth. (L. H. D.)

**Chiang Kai-shek** (1886– ), Chinese general and political leader, a native of Ningpo, Chekiang province. Joining the Kuomintang at an early age, Chiang Kai-shek became head of the Whampoa Military Academy under the nationalist régime headed by Dr. Sun Yat-sen in Canton, in 1920. He first came into nation-wide prominence as the outstanding leader of the advance of the nationalist forces from Canton to the Yangtze valley in 1926–27. After the capture of Shanghai and Nanking in the spring of 1927, Chiang broke off relations with the Communists, who had hitherto been co-operating with the Kuomintang, suppressed them in the territory under his control and gave a socially more conservative turn to the entire nationalist movement. In the summer of 1927 he married Miss Mayling Soong, sister of the well known financier, T. V. Soong. Especially during recent years Mme. Chiang Kai-shek has been closely associated with her husband's arduous administrative tasks. Since 1927 Chiang Kai-shek has been China's national leader. He has several times assumed and resigned the post of Premier in the Nationalist Government; but he has always remained generalissimo of the Chinese armed forces, so far as these were subject to Central Government control. Chiang Kai-shek was detained for two weeks in Dec. 1936, by his subordinates, Marshal Chang Hsueh-liang and General Yang Hu-cheng. Personal and political grievances were mingled in this attempted *coup d'état*, which ended with the release of Chiang and the retirement of the generals who had detained him. After this incident, however, Chiang was apparently won over to the idea of a

more conciliatory attitude toward the Chinese Communists, who, in turn displayed readiness to renounce their more extreme ideals of social revolution and to co-operate again with the Kuomintang and the Nationalist Government. Chiang Kai-shek faced the supreme crisis of his career when the initial clash at Lukowkiao, near Peiping, developed by successive stages into a major war between Japan and China (see CHINESE-JAPANESE WAR). Despite the military reverses which by the end of the year had led to Japanese occupation of most Chinese territory north of the Yellow river and of the Shanghai-Nanking area, Chiang Kai-shek gave no indication of a desire to sue for peace, remaining faithful to a statement which he made at the beginning of hostilities: "Let us realize that, once war has begun, there is no looking backward, we must fight to the bitter end." (W. H. CH.)

**Chicago,** American city, port of entry, county seat of Cook county, Ill., is situated at the south-west corner of Lake Michigan. It is the second city of the United States in population, manufactures and volume of trade. It is the largest centre of rail traffic and of air traffic and is a port for a great tonnage conveyed by lake ships, principally bulk cargoes of iron ores, fuel and blast furnace flux. It has access by the Illinois waterway to the inland navigation routes of the Mississippi valley. Small steamers make direct ocean voyages to and from Chicago via the St. Lawrence river and the Welland canal.

Chicago's population in 1937 was set at 3,632,701 by the U.S. Census Bureau in an estimate announced December 3. This represents a gain of 256,263 since the decennial census of 1930 when there were 3,376,438 inhabitants in the city proper (area 201.90 sq.mi.) and 4,364,755 in the entire metropolitan district with an area of 1,119.29 square miles. The recent estimate indicates that Chicago has more than regained a loss of 117,920 indicated by a quasi-official check in 1934 to determine the effects of the economic depression.

By the close of 1937 lack of adequate housing was felt, but construction declined in the latter part of the year after a slight gain in earlier months. The city still labours under the handicap of an antiquated building code, amendment of which has been long promised but not yet made by the city council.

Most of 1937 may be described as uneventful and prosperous by Chicago standards. Although 85,000 families were in receipt of direct relief and close upon 100,000 were at times employed upon Federal Works Progress Administration projects, the city's manufacturing establishments early in the year approached capacity output. In 1935, year of the last Federal business census, they employed 318,718 persons, paid \$368,020,000 in wages and sold goods valued at \$2,379,773,000.

For 75 years a storm centre of the labour movement in the United States, Chicago, except for its outlying steel communities, enjoyed comparative calm in 1937 while nearby areas were scenes of widespread strikes. Most of the city's trades, already organized under the American Federation of Labor, remained calm, differences being settled by negotiation. A strike of taxi-drivers brought the only considerable violence in the downtown parts of Chicago but there were no fatalities. Just within the city's south-eastern border, however, on May 30 occurred a sanguinary conflict between strikers organized by the Committee for Industrial Organization and Chicago police near the gates of the plant of the Republic Steel Corporation. Ten strikers were slain by police gunfire. A coroner's jury pronounced the cases to be justifiable homicide, finding that the police fired in self-defence. A U.S. Senate committee and a "Citizens Emergency Committee on Industrial Relations" arrived at contrary conclusions. The cases were closed December 21, when 61 rioters were dismissed with trifling fines.

**OUTER DRIVE BRIDGE, Chicago**, formally opened by President Roosevelt, largest bascule bridge in the world, 331 feet long, 108 feet wide and costing \$12,300,000

Chicago's perennial struggle with crime resulted in substantial improvement in 1937. The annual report of State's Attorney Thomas J. Courtney showed that 1,176 defendants were sent to State prison, and 464 to the county jail or city bridewell during the year. Probation was given to 329 offenders. Convictions were obtained in 89% of cases against gunmen and burglars. Convictions were had in 94% of cases of automobile theft and that class of crime has been reduced to its all-time-low record in Chicago.

The city celebrated the centennial anniversary of its charter as a city by the State of Illinois by a series of pageants beginning March 4 called the Charter Jubilee. The year's gala occasion was the formal opening of the Outer Drive bridge near the mouth of the Chicago river. This project begun in 1931 had been interrupted by the economic depression. Work was resumed in 1935 with the aid of Federal grants amounting to \$2,330,181. The entire cost of the works was \$12,300,000. Completion of the bridge gave to Chicago a new boulevard from the northern to the southern parts of the city along the shore line of Lake Michigan, and obviated the necessity of motor traffic passing through the "Loop," central business district. President Franklin D. Roosevelt was the principal speaker at the opening ceremonies on October 5, delivering an address on world affairs which led to the calling of the Nine-Power Conference at Brussels to consider Far Eastern affairs.

Work was begun and two-thirds completed on a lock at the mouth of the Chicago river to prevent storm water in the city from reversing the river's flow and emptying sewers into the lake, from which the city's drinking water is obtained. This project is in anticipation of the reduction of the city's diversion of water from Lake Michigan on Jan. 1, 1939, to 1500 cu.ft. per second from the present 5000 cu.ft. per second. The control lock is part of a program involving the rerouting of the city's sewers to newly erected disposal works. This immense undertaking, involving expenditure of \$60,000,000 and the building of 73 miles of intercepting sewers, was approaching completion at the end of 1937. The budget of the municipality of Chicago for 1937 aggregated \$131,876,630.

(L. H. L.)

**Chicago, University of.** An institution of higher education and research in Chicago, Ill., founded in 1890. On Oct. 1, 1937, the members of the faculty, exclusive of assistants and of teachers in the laboratory schools, numbered 840. In all departments and in all grades of service the university employed approximately 3,000 persons. In the autumn quarter, 1937, there were 7,705 students; 4,345 men and 3,360 women. Of this number 3,705 men and 2,330 women were in the divisions and professional schools and 640 men and

1,030 women in University college (downtown division offering evening and Saturday courses). The total enrolment for the academic year 1936-37 was 12,788. The home study, or correspondence, department had an average enrolment of 3,670, exclusive of the totals given above.

The total funds held by the university as of June 30, 1937, amounted to \$121,638,348.50, an increase of \$5,114,179.80 over the figure in 1936. These funds were divided as follows: endowment, \$67,237,276.10; plant, \$41,446,531.55; other funds, \$12,954,540.85. The total income of the several divisions of the budget was \$7,657,359.85, an increase over the previous fiscal year of \$43,781.68. The University of Chicago Press published 71 books during the academic year 1936-37, in addition to 32 bound books and pamphlets, the annual proceedings of seven professional societies, four maps, and 16 scholarly journals.

Two notable curricular changes took place during 1937. By integrating fundamental subjects such as psychology, economics, political theory and philosophy into regular law courses, the Law school curriculum was revised to reflect a realistic approach to law in its relation to forces in society. A "four-year college unit," comprising the last two years of high school and the first two of college, became a definite part of the university's new plan, and a curriculum was devised to provide a general education for students not interested in subsequent scholarship.

Charles R. Walgreen, Chicago business man, gave the university \$550,000 for the foundation of a chair for the study of American institutions. Construction of the Public Administration Clearing House building, to house the 17 associations of technical experts in governmental administration, made possible by a \$1,150,000 gift from the Spelman fund, was begun during the year. Reconstruction of Goodspeed hall for the art department, under funds provided by May and Leola Epstein, was completed.

The year closed with an accession figure of 1,196,118 bound library volumes, an increase of approximately 35,000 over July 1, 1936. President, Robert M. Hutchins, LL.D.

**Child Guidance:** see CHILD WELFARE.

**Child Labour.** In 1937, two States, North and South Carolina, passed laws fixing, with some limitations, sixteen as the general minimum age for employment. With these, ten States have now established by law sixteen as the age for employment: Ohio and Montana more than twenty years ago, Wisconsin and Utah in 1933, Connecticut and Pennsylvania in 1935, Rhode Island and New York in 1936. In all these States except Rhode Island the legal minimum age had been fourteen. There has been no addition in recent years to the very small group—California, Maine, Michigan, and Texas—which has for some years had a fifteen-year minimum age.

The movement for a Federal child labour law also gained great momentum in 1937. Two quite different proposals were before Congress. Senator Wheeler's bill introduced in the spring of 1937 followed the method utilized for excluding prison-made goods from a State, recently held constitutional by the Supreme Court. Under this proposal Congress would authorize a State to exclude goods produced by children in violation of its own child labour standards.

A second approach has been the prohibition of the shipment of the products of child labour in inter-state commerce, the decision of the Supreme Court in the Wagner Labor Relations Act having led to the belief that such a law might now be sustained. Two bills based on the power of Congress to regulate inter-state commerce were introduced in the Senate during 1937—one by Senator Barkley of Kentucky and the other by Senator Johnson of Colorado. The Labor Standards bill, known as the Black-Connery bill, providing for Federal wage and hour standards, utilizes both methods for the control of child labour—exclusion by the States of the products of child labour from other States and prohibition of their shipment in inter-state commerce.

In this bill, the minimum age under the regulation of inter-state commerce is sixteen for general employment and eighteen for hazardous occupations. In the Senate, the Wheeler-Johnson bill was substituted for the original child labour provisions of the Labor Standards bill, and some weakening amendments were adopted. The bill as amended passed the Senate, but great controversy developed over the wages and hours provision of the bill in the House; and failing to pass in the special session in December it was sent back to the labour committee of the House. There was little or no opposition to the child labour provisions.

The Sugar Act of 1937, Title III—Conditional-Payment Provisions—provides, in section 301, that for a producer to share in the payments made by the Government under the Act no child under fourteen years of age shall have been employed or permitted to work on his sugar farm and no child between 14 and 16 shall have been employed more than eight hours a day. An exception is made if the father of the child is the legal owner of not less than 40% of the farm crop at the time he was employed. This congressional prohibition carried a step farther the regulation begun under the Costigan Sugar Act of 1934, which permitted the secretary of agriculture to fix a minimum age in the contracts made with the farmers under the Act.

Current figures are not available for the nation as a whole as to changes in the number of working children under sixteen years of age. The last census (1930) showed less than 200,000 employed in non-agricultural occupations and more than 400,000 in agriculture. The numbers in manufacturing occupations have decreased greatly since 1930, especially during the period the NRA was in effect; but after that act was declared unconstitutional in May 1935, the numbers increased where new legal standards have not been adopted. The number of first working papers issued boys and girls of fourteen and fifteen in the States reporting to the Children's Bureau showed a decline from 10,244 in the first six months in 1936 to 4,899 in 1937.

If, however, only the States which have not adopted the sixteen-year minimum age are considered, there was an increase during these months in 1937 of 19% as compared with 1936.

The British *Ministry of Labour Gazette* for November 1937, gives the estimated number of insured boys and girls under sixteen years of age employed in Great Britain in occupations other than agriculture as 501,200 boys and 412,800 girls. Of this number 231,120 are employed in the distributive trades alone, 93,822 in the textile trades and 32,700 in mining. A recent report of a departmental committee on children in unregulated occupations estimates 125,000 in such occupations.

The number of working boys and girls under sixteen years of age seems to be at least five times as large in Great Britain as in the United States. The causes of this difference may be found in the fact that most children in Great Britain leave school when the legal age is reached while in the United States very large numbers remain in school beyond the legal working age and the fact that the legal minimum age is now two years higher in the more important industrial States of the United States than in Great Britain.

Following years of agitation for the raising of the school-leaving age an Education Act was passed by Parliament in 1936 raising the age from fourteen to fifteen years. This act does not, however, go into effect until Sept. 1, 1939, and even then local authorities will have the right to permit children fourteen years of age to leave school for what is described as "beneficial employment." (See also LABOUR LEGISLATION; AMERICAN BAR ASSOCIATION; CHILD WELFARE.) (G. AB.)

**Child Labour Amendment.** The proposed amendment to the Constitution of the United States, authorizing Congress to limit, regulate and prohibit the labour of persons under 18 years of age was submitted by Congress to the States for ratification in 1924. The amendment met with so much opposition in the States that by 1930 only five States had ratified it. In the depression dilemma, the attitude toward national control changed sharply, and by 1936, 26 States had ratified. Four States, Kansas, Kentucky, Nevada, and New Mexico were added to the list in 1937. In these States resolutions rejecting the amendment had been adopted in 1925 and 1926 respectively, and opponents of the amendment sought injunctions against certification of ratification to the United States secretary of State on the ground that the original action of the State legislatures was final and that the amendment was no longer pending—a reasonable time for ratification having elapsed.

On September 16 in the case of *Coleman v. Miller*, the Kansas Supreme Court decided that the amendment is still pending and that ratification on October 1 in the case of *Wise v. Chandler* after rejection is valid; while the Kentucky Court of Appeals sustaining both these contentions granted the injunction sought. This is a question which, if the necessary 36 States ratify, will undoubtedly be brought before the United States Supreme Court for decision.

In the spring of 1937 Senator Vandenberg of Michigan introduced a joint resolution proposing an amendment which would "empower Congress" to limit and prohibit the employment for hire of persons under 16 years "and require ratification within a seven-year period." While 16 is the minimum age now sought for general employment, the 18-year minimum has been urged for the extremely hazardous occupations and supporters of the original amendment are opposing the Vandenberg proposal. Although reported favourably by the Senate Judiciary Committee it did not come to a vote in 1937. (G. AB.)

**Children, Backward:** see BACKWARD CHILDREN.  
**Children, Gifted:** see GIFTED CHILDREN.

**Children's Books.** Publications during 1937 showed a wide variety in content and format, and an emphasis on fiction for older girls and fewer stories of adventure for boys. Picture books and others for younger children predominated. Production as a whole indicated greater recognition of the illustrator as contributor and closer co-operation between writer and artist.

Among picture books distinguished for text, illustration and design were *Animals of the Bible*, brief selections from the King

James version with full page lithograph drawings in black and white by Dorothy Lathrop, *Shawneen and the Gander* by Richard Bennett, *Walter the Lazy Mouse* by Marjorie Flack and *Four and Twenty Blackbirds*, nursery rhymes collected by Helen Dean Fish and illustrated by Robert Lawson.

Outstanding fiction included *Vinny Applegay* by Ethel Parton, *Petite Suzanne* by Marguerite de Angeli, *When Guns Thundered at Tripoli* by Charles Finger and *Trader's Children* by Laura Armer.

In the fields of folklore and legend were *The White Stag* by Kate Seredy, *Seven Simeons*, a Russian tale retold and pictured by Boris Artzbasheff and *Swords in the Dawn*, a fictionized version of the Hengist and Horsa epic by John O. Beaty.

History and biography were represented by *No Other White Men* by Julia Davis, *Mediaeval Days and Ways* by Gertrude Hartman, *The Lost Queen of Egypt* by Lucile Morrison and *The Boy Shelley* by Laura Benet.

*This Year: Next Year* by Walter de la Mare and Harold Jones was the only important contribution to children's poetry. May Lamberton Becker's *First Adventures in Reading* (1936) was brought out in slightly revised form in England with the title *Choosing Books for Children*. Books on science, hobbies and the arts were well represented.

Events of the year were the award of the John Newbery Medal by the Section for Library Work with Children of the American Library Association to Ruth Sawyer for her *Roller Skates* as the most distinguished contribution to American children's literature during 1936, the award by the English Library Association of a Carnegie Medal to Arthur Ransome for his *Pigeon Post* as the outstanding juvenile publication in England, and the gift by Frederick Melcher, the donor of the John Newbery Medal, of a Caldecott Medal to be awarded annually for the most distinguished American picture book. An important change in the Library of Congress, Washington, D.C., was the assembling in the rare book room of 7,000 children's books published prior to 1850.

Important bibliographies were *Children's Books from Foreign Languages*, a list of English translations prepared by Ruth A. Hill and Elsa de Bondeli and *The History of Children's Literature, a Syllabus with Selected Bibliographies* by Elva S. Smith.

Book fairs at which children's books were emphasized were held in London, Montreal, Toronto, New York, Boston and elsewhere. Books for children were a part of several of the national exhibits at the Paris Exposition. The total juvenile publications in 1937 (not including pamphlets, text books and new editions) were: United States 853, England 916 (including 11 translations). Many books of the year were published in both countries, simultaneously or at close intervals. (E. L. P.)

**Great Britain.**—A large number of excellent books for children, written by all kinds of people, from professors in the older universities to school-girls, appeared in England in 1937.

Arthur Ransome, who made his fame some years back with *Swallows and Amazons*, continues to be the most popular author among intelligent boys and girls from 10 to 18. In 1937 he gave them *We Didn't Mean to Go to Sea*, a story of adventure delightfully illustrated by himself with pictures of sailing and sailing boats. Two of the kind of children for whom, or about whom, Mr. Ransome writes have been inspired to make a book themselves. But *Far Distant Oxus*, by Katharine Hull and Pamela Whitlock, is not a mere imitation; story and pictures are full of originality, and they are put together with a skill that many older authors might envy.

Some publishers are trying to replace the unreal "adventure stories" once current by well-informed books about exciting deeds in many continents. The best example is perhaps *Carmen*, *Silent Partner*, by Chesley Kahmann, but other volumes in the same series are almost as good. The most attractive historical story

From "ANIMALS OF THE BIBLE" by Dorothy P. Lathrop

book for children in 1937 was Carola Oman's *Robin Hood*. It is taken from the 14th century *Lytell Geste*, and shows scholarly care, without any pedagogic heaviness to spoil the inimitable tales. An admirable story about the religious life of children in its relation to their daily life has been written from the Roman Catholic standpoint by Cecily Hallack, *Adventure of the Amethyst*. Good stories about modern middle-class children are: *John and Mary Abroad*, by Grace James, for children of six and seven; *Jane Versus Jonathan*, by Vera Barclay, for children of 10 to 12, and *Jam Tomorrow*, by Monica Redlich, for those of 12 and upwards. *The Family from One End Street*, by Eve Barnett, is a cheerful story about some very poor children.

Eleanor Farjeon remains supreme in her own line of fairy stories. *Martin Pippin in the Daisy Field* is a delicious poetic fantasy about village children and elves and the Sussex countryside. Olive Dehn's *Tales of the Taurus Mountains* have the classic fairytale atmosphere. *The Magic Poodle*, by B. G. and I. G. Williamson, and *Worzel Gummidge Again*, by Barbara Euphan Todd, are amusingly delightful tales about ordinary children's adventures with fairy characters in natural country surroundings. *From Seven to Eight*, by M. T. Candler, is an attractive book of the same type for younger children. Among books of short stories, the most witty is Prof. J. B. S. Haldane's *My Friend Mr. Leaky*. Among many clever picture books, the best is perhaps *Lucy Brown and Mr. Grimes*, by Edward Ardizzone. The children's book which seems to have given the greatest delight to people of all ages in 1937 is Prof. Tolkien's fascinating tale, *The Hobbit*, which leads one far away into lands of imaginative enchantment. (I. B. O'M.)

**Children's Bureau, United States:** see CHILD WELFARE.

**Child Welfare.** The year 1937 witnessed notable developments in child welfare in many countries, particularly regulation of child labour, protection of maternal and child health, and development of public administration of services for maternal and child health and child welfare.

The maternal mortality rate for 1935 was lower than that for 1934 in Australia, Canada, Chile, Czechoslovakia, England and Wales, Estonia, the Netherlands, New Zealand, Northern Ireland, Switzerland, and the United States. The lowest maternal death rates were those of the Netherlands and Italy—30 per 10,000 live births. The maternal mortality rate of the United States—58 per 10,000 live births—was the lowest ever recorded for that country, but it was higher than that of any of the other countries mentioned above. A national conference to consider ways of improving maternal and infant care was called by the chief of the U.S. Children's Bureau to meet Jan. 17-18, 1938. The infant mortality rate for 1935 was lower in Australia, Canada, Chile, Czechoslovakia, England and Wales, Latvia, Lithuania, the Netherlands, Scotland, and the United States. The rate for New Zealand—32 per 1,000 live births—remained unchanged and was lower than that of any of these countries.

During 1937 progress was made in the regulation of child labour through national and international action. The session of the International Labor Conference in June 1937 adopted two revised conventions raising the minimum age for entrance into industrial and non-industrial occupations from 14 to 15 years, providing protection from hazardous occupations for boys and girls of 16 and 17 years, and requiring that records of age be kept for minors under 18 years of age.

In the United States four States ratified the pending constitutional amendment that would give Congress the power to pass a Federal child-labour law; eight more States must ratify the proposed amendment before it can become effective. Two States passed laws making 16 years the minimum age for factory employment at any time and for any employment during school hours, bringing to 10 the number of States with a 16-year minimum-age standard. The remaining States, with one exception, have a minimum age of 14 or 15 years for such employment.

England placed upon the statute books after prolonged debate the new Factories Act reducing the maximum weekly working hours for children under 16 years of age from 48 to 44. Unsuccessful efforts were made in both Houses of Parliament to raise the minimum age for employment to 15 and to reduce working hours of minors under 18 to 40 a week. The education bill for Scotland, passed by the British Parliament, raised the school-leaving age in Scotland from 14 to 15 years, with exemptions for "beneficial" employment for children 14 years old, as did the British Education Act of 1936 for England, the effective date for both acts being Sept. 1, 1939. Norway's new labour law, effective Jan. 1, 1937, raised the minimum age for employment from 14 to 15 years and prohibited employment of persons over 15 years who are still required to attend school.

Considerable interest was manifested in child adoption and care of dependent children. A subcommittee of the Advisory Committee on Social Questions of the League of Nations continued work on a report on the placing of children in families, which is to have final consideration at a session in 1938. In England the departmental committee set up in January 1936 to investigate the methods pursued by adoption societies or other agencies engaged in arranging for the adoption of children presented a report proposing that all agencies concerned with adoption be licensed by the local authorities. Under the Adoption of Children Act orders for adoption rose from 2,943 in 1927 to 5,180 in 1936.

In the United States the Children's Bureau completed field work in a study of adoptions in 11 States. In connection with this study statistical analysis was undertaken for about 2,000 adoption petitions.

A number of countries set up national child-welfare agencies in 1937. Argentina created a Bureau of Maternal and Child Welfare by a law passed Dec. 31, 1936. Denmark, on May 22, 1937,

enacted legitimacy and maintenance laws replacing earlier statutes. In Finland, by a law effective Jan. 1, 1937, child-welfare work was reorganized under the general direction of a single agency. This was the first general child-welfare law enacted since Finland became independent. France, by presidential decree dated Sept. 30, 1937, set up a High Council for Child Welfare with the minister of public health as chairman. In Mexico a presidential decree effective July 1, 1937, established a Department of Social Aid to Children, to be in charge of health work for mothers and pre-school children and to supervise all agencies, public and private, national, State, and local. Sweden, by laws to become effective Jan. 1, 1938, provided for nation-wide maternal and child-health services and for Government aid to mothers during pregnancy and at childbirth, to unmarried mothers, to orphans, and to children whose parents are incapacitated for work. The newly created child-welfare agency of Venezuela made definite plans in 1937 for the first national child-welfare congress, to be held in Caracas in 1938.

The U.S. Children's Bureau, first public agency in the world created to consider as a whole the welfare of children, celebrated its twenty-fifth anniversary in 1937. It was also the first calendar year during which the States and the Federal Government, through Federal grants-in-aid administered by the Children's Bureau, co-operated under the Social Security Act in the development of services for maternal and child health, crippled children and child welfare. Marked progress was made in most of the States in the operation of all three programs. Several States passed laws establishing or reorganizing State departments of welfare, with a trend toward unifying such services as public assistance, relief, and child welfare. Many States clarified and strengthened the legal basis for co-operation with the Children's Bureau in services for maternal and child health, crippled children and child welfare, as well as with the Social Security Board in aid to dependent children. (K. F. L.)

**Chile**, a republic on the west coast of southern South America; language, Spanish; capital, Santiago; president, Arturo Alessandri; area, 289,776 sq.mi., with the country over 2,000mi. in length (from the tropical north to the sub-arctic south) and at no point more than 200mi. wide. The population was officially estimated at 4,530,051 in 1936. Chile has more Northern European elements in its population than any other Hispanic American country, with German-Chileans preponderant in some sections. The chief cities are: Santiago (827,910) and Valparaiso, the chief port (200,000).

**History.**—The Government is administered by a president and a cabinet which is partly under control of the congress. The year 1937 was marked by political instability, as the moderately Rightist Government of President Alessandri maintained itself with increasing difficulty against the growing dissatisfaction of left wing groups. The Conservatives and Liberals supported the president in Congress and furnished a majority of the cabinet. The so-called National Popular Front, linked with communists on the one hand and Nazis ("Nacistas") on the other, formed the opposition, while the disunited "middle of the road" radicals held the balance of power, with some favouring co-operation with the president, and some an accord with the left.

The early months of the year were fraught with political uncertainty, as the various parties manoeuvred for advantage in the March congressional elections. Increasing political activity and propaganda by the leftists led to the passage of an act restricting their activities and curtailing freedom of the press and of assembly, a signal Government victory. In February the proposal of an Internal Security Law which would give the president virtual dictatorial powers marked a line of cleavage for the congress-

sional elections. These, held on March 8 without major disorder, resulted generally in victory for the Government parties, although 3 Nazis and 7 communists gained seats.

The political tranquility expected to follow the elections failed to materialize. Two days after the elections, Gustavo Ross, foreign minister and minister of finance, an outstanding leader of the rightist groups, resigned, ostensibly because of President Alessandri's refusal to force resignation of radical and leftist cabinet members, but also due to growing popular resentment against him on account of increasing food prices, for which he was held responsible. For four years director of Chilean finances, during which time he had readjusted the nitrate industry, put exchange under control, and balanced the budget, Ross was accused of fostering a food shortage through his policy of encouraging exports to the United States, thus favouring the agriculturists and capitalists and sacrificing the interests of labour. To meet the food shortage, the Government adopted various measures to lower prices.

By May increasing Nazi activity became of serious concern to the Government. Many Nazis were arrested when tear gas bombs were thrown at President Alessandri on May 21, and frequent Nazi clashes with police occurred throughout the year, with a number of fatalities. To meet the Nazi threat the minister of the interior banned all mass meetings and the wearing of uniforms and insignia denoting group affiliation. In August, Congress was plunged into bitter debate when charges were made concerning German Nazi influences in Valdivia, centre of a considerable population of German extraction. A visit by Minister of Labour Bernardo Leighton to Valdivia brought denials from German educational institutions there that their educational policies were contrary to Chilean interest.

Toward the end of the year, the forthcoming presidential elections of 1938 began to dominate the political scene. In August, the Popular Front nominated a socialist, Colonel Marmaduke Grove, who had been provisional president for three days during the turbulent year 1932 and was regarded as an extremist. This was expected to bring about a liberal-radical coalition, while Gustavo Ross was considered the probable choice of the parties of the Right. In May the return, after six years of exile, of former president-dictator Carlos Ibáñez, the only Chilean retiring chief executive ever to flee the country, added complications. In October, Ibáñez announced his candidacy, asserting that Nazi support for him was constantly growing, and urged a program of social reform which would eliminate foreign economic imperialism.

In foreign relations the most outstanding development was a treaty with Bolivia in August, after months of conferences between economic experts of both nations. Included among its provisions were: authorization of a Bolivian customs station at Arica and unrestricted importation through Chilean territory; a most-favoured-nation clause, along with an agreement for the establishment of permanent trade commissions; and elaborate plans for stimulation of cultural exchanges between the two countries.

Earlier in the year a Chilean commission visited Japan at the expense of the Japanese Government to consider direct steamship service between Japan and Chile, and the development of an export trade to Japan of nitrate fertilizers, copper, and farm products, in return for Japanese merchandise.

Alarm over Argentine activities in the far south, in the vicinity of Tierra del Fuego and Magallanes, was aroused in June by an article in the newspaper *Aurora*, which asserted that Argentina was ambitious to seize Chilean territory, and pointed out increased Argentine military preparations, colonization efforts in Patagonia, military manoeuvres near the Chilean frontier, and the visit of Argentine livestock experts to frontier districts. Possibility that this article was inspired by a desire to win popular support for

CHILE: Industrial production

the government's program for development of the navy, the army, and the aviation corps was the explanation offered by foreign observers. Chilean concern over the growing obsolescence of her navy had been aroused earlier by the visit of the Argentine fleet in May, and following the *Aurora* article the Government exerted itself to improve the national defence. A heavy outlay for rapid naval improvement and for the purchase of military aeroplanes was begun. To defray these costs, for which no previous provision had been made, the sale of State lands was proposed.

**Trade and Communication.**—Chile has direct steamship connections with other parts of America and with Europe, and regular, frequent air transport service north to Panama and New York, and east to Buenos Aires. Railways connect the country with Bolivia and with Argentina. The main route to Argentina, the trans-Andean, has been closed to freight traffic since 1934, because of landslide damage, but funds for its reopening were authorized by the Argentine Government in 1937. Resumption of complete service is expected by late 1938. Within the country there is a railway system of approximately 5,540mi. and a 2,300mi. highway network. A highway program adopted in 1936 provides for the expenditure of 135,000,000 pesos on highway development from 1937 to 1940, with emphasis on the vicinity of Santiago and on the Southern provinces of the country. Communication with the far north and the far south is by boat and aeroplane.

In 1936 foreign trade showed a definite improvement which was, however, completely eclipsed by the gains of the first half of 1937. In 1936 the total trade was 23% of that of 1929; in the first half of 1937 it reached 43% of the comparable of 1929 figures. Imports (1936) were 346,700,000 pesos (84% manufactured articles), with Germany (29%), the United States (25%), and Great Britain (13%) leading. In the first half of 1937, despite a 2% increase in total volume, imports from Germany were less than 1% greater and those from Great Britain approximately 8% less, while imports from the United States had increased 24%, putting that country in the lead. Exports in 1936 were valued at 548,800,000 pesos, to the United States (17%), Great Britain (16%), and Germany (16%). The first half of 1937 showed a 91% increase over the corresponding period in 1936, with the chief gains to the United States. Mineral products comprised 75% of the 1936 exports, with copper (38.8%), nitrates (29%), iron ore, coal, and gold the chief items. Total value of mineral products exported in the first

half of 1937 was approximately 110% greater, with the greatest increase in copper. Non-mineral exports are: wool and frozen meats, and miscellaneous agricultural products, especially wine and cereals.

**Agriculture, Manufacturing and Minerals.**—Mineral production is principally copper and nitrates, with totals dependent upon foreign demands and consequently shifting greatly from year to year. In the first half of 1937 production reached its highest since 1929. Agriculture is the chief industry, with its products consumed largely within the country. Second in importance is manufacturing (almost entirely for domestic consumption), which employs 23.8% of the industrial population. Textiles are the principal manufactured product, with cement and electric power next. Considerable advance has been made within recent years. Livestock, principally sheep for wool and for meat, is important in the south. Tourist trade possibilities are just beginning to be developed in Chile.

**Finances.**—The monetary unit is the peso (value: approx. four cents U.S.). The national budget for 1937 was \$74,453,269.11. Primary education is free, non-sectarian, and compulsory.

**Education.**—In 1935 there were 4,345 primary schools (enrolment, 542,338), and 230 secondary (enrolment, 41,893). The 1937 budget allotted \$12,462,075.16 (16%) to education. The National university of Chile and the Catholic university, at Santiago, and the University of Concepción, at Concepción, are important.

**Army and Navy.**—Chile has obligatory military service, with a peacetime army of 21,000. The navy has declined in recent years, but a strong "big navy" movement was under way in 1937.

**BIBLIOGRAPHY.**—George McCutchen McBride, *Chile: Land and Society* (New York), 1936. (L. W. Be.)

**China,** a republic in East Asia, bounded on the north-east by Manchoukuo, on the north and west by Outer Mongolia, Siberia and Tibet, on the south by India, Burma and French Indo-China, on the east by the Pacific ocean. Capital, Nanking (temporarily removed to Chungking); president, Lin Sen. Excluding those areas over which no effective Chinese sovereignty has been exercised for many years (Manchoukuo, Outer Mongolia, Tibet) China has an area of 2,845,740 sq.mi. and a population of 418,479,000 (estimate of directorate of statistics in Nanking). No comprehensive census has ever been taken. Population of larger cities: Nanking (estimated, 1937), 1,000,000; Shanghai (foreign and Chinese administrative areas reckoned together, census of 1935), 3,490,762; Peiping, 1,487,289; Canton, 861,024; Hankow, 777,993; Tsingtao, 440,135. There are about 185,000 foreigners in China, including 74,000 Japanese, 64,500 Russians, 13,344 British, 8,637 Americans and 3,444 Germans.

**History.**—(For the Chinese-Japanese War, see that heading.) The ancient Imperial régime in China was overthrown by revolution in 1912 and a republic was proclaimed on Feb. 12, 1912. Experiments in Western parliamentarism were not successful and actual power over various parts of the country drifted more and more into the hands of generals, such as Wu Pei-fu, Chang Tso-lin, Feng Yu-hsiang and others. A new phase of China's history began when the capital was set up at Nanking after the campaigns of the period 1926–28 had established the Kuomintang (National People's Party) as the dominant political organization of the country and Chiang Kai-shek as its outstanding personality (see CHIANG KAI-SHEK and KUOMINTANG).

The Kuomintang is the sole legal political party in China and the national government derives its authority from the Kuomintang. There are no general elections; and the nearest approach to a representative body in China is the annual plenary session of the Kuomintang central executive committee and central super-

visory committee. The Government is composed of five yuans or departments, the functions of which are indicated by their titles: the executive, legislative, judicial, examination and control yuans. The Executive Yuan exercises general supervision over the ministries and commissions and its president is really the acting head of the Government. The president of the National Government possesses only titular powers. The Legislative and Judicial Yuans are concerned respectively with the drafting of laws and the administration of justice. The Examination Yuan is in charge of Government personnel matters and the Control Yuan exercises functions of general supervision and auditing. There is also a cabinet of ministers. The leading figure in the National Government throughout the last decade has been Marshal Chiang Kai-shek.

**Trade and Communications.**—China's imports amounted to 941,545,000 Chinese dollars and exports to 705,741,000 dollars in 1936. Exports were stimulated by the abandonment of the silver basis of the currency in 1935 and the depreciation of the Chinese dollar, which has since then been maintained at a rate close to 29.65 American cents. During the first eight months of 1937 imports were 785,620,291 dollars and exports 616,863,859 dollars, both showing an improvement over the preceding year. After August, however, there was a heavy decline in China's foreign trade as a result of the widespread hostilities with Japan. Imports through Shanghai, for instance, declined from 77,645,229 dollars in July to 28,162,294 dollars in August and to 7,319,714 dollars in September. Exports from the same port fell off from 52,890,654 dollars in July to 23,756,935 dollars in August. China's main exports are eggs and egg products, silk, cotton, wood-oil, ground-nuts, seeds of various kinds, tea and various ores and metals, including wolfram and antimony. Its main imports are metals, machinery, chemicals, dyes and paints, petroleum and tobacco.

China had between 6,000 and 7,000 miles of railways at the end of 1936 and a five-year plan for the construction of 5,300 additional miles after 1936. Highway construction, which had increased substantially during recent years, reached the figure of 56,000 miles in 1935. According to a report of the ministry of communications in 1931, China had 2,986 registered ships, with a tonnage of 431,892. China has no trans-oceanic shipping lines and much of the coastal shipping is in the hands of British and Japanese firms. A total of 87,755 ocean vessels entered and cleared at Chinese ports in 1936. British ships represented 16,000,000 tons; Japanese 9,500,000 and Chinese 7,300,000. The Government telephone system in 1935 served 21 cities and 62 others were served by private and provincial systems. About 250,000 telephones were in use. China has 53,000 miles of telegraph lines and several high-power radio installations.

The chief cities of China are linked up by air routes, which often serve as a substitute for non-existent rail connections. Commercial aviation is in the hands of the Sino-American China National Aviation Corporation and the Sino-German Eurasia Aviation Corporation. The aeroplanes of the former flew 1,955,801 km. and carried 10,404 passengers; while the latter carried 2,951 passengers and flew a distance of 744,735 km.

**Agriculture, Manufactures and Mining.**—China is an overwhelmingly agricultural country and is predominantly a land of small-scale farming. As many as 36% of its farms are less than 1.5 ac. in size, while 62% are less than 4.3 ac. Rice is the main crop and the main food in the southern and central part of the country, while wheat, millet, kaoliang and other grain crops are raised in the North. Animal husbandry is little practised, as there is little spare land for pasturing. China has fallen behind in the production of its traditional tea and silk because of lack of standardization and grading; efforts have been made recently to improve quality and increase output of tea, silk and cotton.

Coal is China's most important mineral. The geological survey

JAPANESE TROOPS entering the Yung Ting Gate to Peiping, China's ancient capital, August 8, 1937, after feeble defence and retreat by Chinese general, Sung Cheh-yuan

of China in 1934 estimated the country's coal reserves at 238,555,000,000 tons, of which more than half was in the mountainous north-western province of Shansi (now largely under Japanese occupation) and almost a third in the neighbouring Shen-si. China's annual output of coal is about 20,000,000 tons. China leads the world in the production of antimony and tungsten. It is very poor in other important sources of mineral wealth, in petroleum, iron, copper, gold and silver. Total deposits of iron are estimated at about 250,000,000 tons, of which about 90,000,000 tons are in Chahar province while a considerable part of the remainder is to be found in Hupeh and Anhwei provinces, in the valley of the Yangtze. Iron ore output is at the rate of about 2,000,000 tons a year. Manufacturing industry, in the modern sense of the term, is still in its infancy in China and is largely concentrated in a few large centres, such as Shanghai, Tientsin, Canton and Hankow. Cotton mills, silk filatures, flour mills, cigarette factories, cement works are among the most common types of industrial enterprises. The fighting in the Shanghai-Nanking area was a terrific blow to China's industrial development, since a great number of factories in the region were destroyed or badly damaged.

**Education and Religion.**—Estimates of illiteracy in China vary from 60–80%. Substantial progress in the educational field has, however, been registered since the establishment of the republic. There were 11,667,888 pupils in elementary schools in 1935, as against 2,793,633 in 1912 and the number of universities and colleges during the same period increased from four to eighty-two. There has been a special effort to spread adult literacy in the larger cities and in some selected rural districts. An aid in the promotion of elementary literacy has been the so-called "thousand character system," instituted by James Y. C. Yen, prominent Chinese social worker, who picked out the most frequently used of the thousands of hieroglyphs which make up the Chinese written language and prepared textbooks based on this simplified written language. China's main religions are Buddhism, Taoism and Confucianism. There are between 5,000,000 and 10,000,000 Mohammedans, mostly in the north-western and far western provinces of the country. There were 2,818,839 Catholics and 512,873 Protestants in China at the beginning of 1935. Missionary work in China has very considerably promoted educational and medical progress, as mission schools, colleges and hospitals have been built in many parts of the country.

**Finances and Banking.**—Under the stress of a rising world price of silver, which produced serious deflationary effects in China, the Government in November, 1935, abandoned the silver basis of the currency and put into effect a system of managed currency. This worked quite smoothly under peacetime conditions; but the war with Japan has exercised a serious detrimental effect on the whole Chinese financial structure. The unit of currency is the yuan, or dollar, which at the end of 1937 was worth 29.65. The budget for 1937–38 was balanced at 1,000,649,496 dollars, a slight increase over the preceding year. Military expenditures took up 39.2% and service on loan obligations 32.4% of the expenditure contemplated under the budget. The largest items on the revenue side were customs receipts (36.9%); the salt tax (22.85%) and the consolidated tax (17.55%), the latter a levy on trade and business. The three largest and most important banks in China are the Central Bank of China, the Bank of China and the Bank of Communications. There are also 14 Japanese and 19 other foreign banks which carry on business in China.

**Army and Navy.**—The peacetime strength of the Chinese army (estimate of the *China Year Book*, 1936) is 2,379,770 men, of whom 1,676,120 are listed as under the direct control of the central Government. There are 49 armies of varying degrees of strength. The majority of the Chinese troops are extremely backward as regards training, organization and equipment, although a number of modern divisions have been formed with the aid of a German military mission which has been resident in Nanking for some years. An air force has been developed with American and Italian technical aid and assistance. The Chinese navy, consisting of five cruisers and a number of gunboats and smaller vessels, total tonnage 41,000, is obsolete by modern standards and was unable to oppose any serious resistance to Japanese naval operations during the war in 1937–38. (See also CHINESE-JAPANESE WAR.)

**Chinese-Japanese War,** the most serious international conflict that has occurred in the Far East since the Russo-Japanese War of 1904–05, began with a skirmish between Japanese troops, engaged in manoeuvres outside of Peiping, and a Chinese garrison post at the Marco-Polo bridge, fourteen miles southwest of Peiping, on the evening of July 7, 1937. Each side accused the other of firing the first shots; and an atmosphere of mutual suspicion and ill will paralyzed sub-

sequent efforts to settle the conflict as a mere local incident.

The Japanese Government on July 11 issued a statement to the effect that the gravity of the situation made it necessary to reinforce the Japanese garrison in North China with troops from Japan. Simultaneously there was some concentration of Chinese Central Government and provincial troops at Pao-ting-fu, the capital of Hopeh Province.

Despite these warlike preparations, efforts to reach a peaceful settlement were not altogether abandoned until the last week in July. Rumours of truce and agreement alternated with minor clashes. A more serious conflict took place at Langfang, a railway station between Peiping and Tientsin, on July 26, when the Japanese employed air bombing for the first time, as they alleged, to rescue a detachment of their troops which had been attacked by Chinese soldiers. The Chinese attributed the responsibility for the fight to the Japanese. On the evening of the same day Japanese troops were fired on when they were entering the Kwanganmen gate of Peiping.

Large scale fighting started on the 28th, when the Japanese Army launched a drive to push the Chinese troops from the environs of Peiping. Within a few days, despite a revolt of the Chinese police at Tientsin which seriously threatened the security of the small Japanese forces in that city, and a massacre of Japanese and Korean residents of T'ung-chow, the capital of the Japanese-dominated East Hopeh régime, Japanese military control of the Peiping-Tientsin area had been effectively established.

The outbreak of warfare in North China cannot be understood without some consideration of its underlying political causes. Ever since the occupation of Manchuria in 1931-32, the Japanese military authorities had exerted constant pressure on North China. Under the terms of the Tangku Truce, signed on May 30, 1933, a demilitarized zone was created in the region between the Great Wall and the frontier of Manchoukuo. In December, 1935, an independent régime, headed by Yin Ju-keng, was set up in this region, with the obvious support of the Japanese Army. Shortly afterwards a similar Japanese-dominated local administration was established in the Northern part of the Province of Chahar. Wholesale smuggling by Japanese and Koreans, exploiting extra-territorial privileges, was another grievance of the Chinese; the existence of this smuggling was confirmed by several statements by the British Inspector-General of Customs, Sir Frederick Maze. The Japanese garrison in North China, maintained under the provisions of the Boxer Protocol, was substantially increased in the spring of 1936, so that Japanese troops in this region outnumbered those of all other foreign nationalities put together.

During 1936 there was a notable resurgence of Chinese nationalism, accompanied by much agitation for resistance to Japanese encroachments. The most spectacular demonstration of this was the detention of Marshal Chiang Kai-shek, Generalissimo of the Chinese forces, at Si-an-fu for two weeks in December, 1936. Among the demands of his captors, Marshal Chang Hsueh-liang and General Yang Hu-cheng, were the cessation of civil war against the Communists and the organization of resistance to Japan. Chang Hsueh-liang and Yang Hu-cheng went into retirement after Chiang Kai-shek's release.

But the Nanking Government reached an informal agreement with the Chinese Communists, who discarded many of their social revolutionary ideas and put forward the idea of a united nationalist front against Japan. The Chinese Government systematically delayed consideration of two Japanese economic proposals for the development of North China with a combination of Japanese and Chinese capital. These were the construction of a railway from Shihchiachung to Tientsin and the exploitation of the Lungyen iron deposits, in Chahar.

In view of all these causes of friction and distrust, it is easy

to understand why a relatively slight initial clash assumed steadily more serious proportions. Each side felt that any concession would be interpreted by the other as a sign of weakness.

**North China Campaign.**—There was a lull of almost two weeks after the occupation of the Peiping-Tientsin area. Each side was busy with further military preparations, while some feeble and abortive peace talks took place between the more moderate representatives of the two countries. Large-scale warfare unmistakably got under way in the second week of August. A Japanese forward thrust against Nankou pass, on the Peiping-Suiyuan railway was quickly followed by the outbreak of fighting at Shang-hai. Subsequent hostilities, until the end of the year, were carried on in two main theatres, North China and the Lower Yangtze valley, although Japanese bombing aeroplanes carried out raids on towns far away from the immediate zones of hostilities, such as Canton, Nan-chang, Hankow and Lanchow-fu.

The Japanese operations in North China began with a movement to the North-west, along the line of the Peiping-Suiyuan railway. The Chinese offered resistance at Nankou pass, a strong natural position in the mountains and fighting here, which began on August 11, continued for more than a week. The Japanese carried out an encircling movement; and the position of the defenders of the pass was made more difficult by advance of some units of the Kwantung Army (the Japanese Army in occupation of Manchoukuo), which led to the occupation of Kalgan, the largest town in South Chahar, on August 25. By this time the defence of Nankou pass had been given up; and the subsequent Japanese advance to Paotou, western rail-head of the Peiping-Suiyuan railway, met with little resistance.

A political factor favoured the Japanese forward movement in this region. There had been perennial friction between the agricultural Chinese and the nomadic Mongols; and the latter, to a considerable extent, threw in their lot with the Japanese and co-operated with them. An autonomous Mongol State, headed by Prince Yun, with its capital at Kwei-hwa, was set up late in October. Its territory included Suiyuan and the Northern part of Chahar Province. The State has received a number of Japanese advisers.

The next Japanese military move took the form of a southward advance along the two main railway lines of North China, the Tientsin-Pu-kow and the Peiping-Hankow. By the end of September the Japanese had occupied Pao-ting, capital of Hopeh Province, on the Peiping-Hankow line, and Tsangchow, a large town on the Tientsin-Pu-kow line.

The main Japanese military effort in October was directed against mountainous Shansi Province, which was invaded from two directions, from the North and from the East, along the Shihchiachung-Tai-yuan railway. There was some fairly severe fighting in the North, where the mountains offered good natural lines of defence and the quality of the provincial troops was stiffened by an admixture of Central Government and Communist units. Ultimately, however, the converging movements of the Japanese troops were successful and Tai-yuan, the capital of Shansi Province, was occupied on November 8.

The Japanese advance southward along the Peiping-Hankow railway was pressed almost to the Yellow river, with the result that all of Hopeh and a part of Honan Province were conquered. Further to the east, along the Tientsin-Pu-kow railway, political considerations, combined with the barrier represented by the broad Yellow river in flood checked the Japanese advance in the Northern part of Shantung. It was hoped that the Governor of Shantung, General Han Fu-chu, if given sufficient time, would swing over to the Japanese side, and that the extensive Japanese property, valued at some 250,000,000 yen, located in Tsingtao, the chief port of Shantung, would be preserved intact if fighting were

avoided in this town. So all the 15,000 Japanese residents of Tsingtao were evacuated toward the end of August and Japanese property was sealed and placed in care of the local Chinese authorities. This attempt to safeguard Japanese property, however, was a failure. Beginning on the night of December 18, Chinese troops commenced to destroy textile mills and other Japanese property in Tsingtao.

Except for the part of Shantung which is south of the Yellow river, Japan's military objectives in North China had been substantially achieved by the end of the year. A political consequence of the Japanese military occupation was the organization, on December 14, of a new North China administration, headed by two elderly politicians who had formerly been associated with the so-called Anfu Clique, Wang Ko-min and Tang Er-ho. General Count Juichi Terauchi, Commander-in-chief of the Japanese Army in North China, assured the new régime of his support. Extensive Japanese plans for the development of North China's natural resources, especially coal, iron, salt, cotton and wool, and for railway building, electrical power installations and harbour construction have been drawn up, but are still in an embryonic stage of realization.

**Shanghai-Nanking Front.**—While the Japanese troops were carrying out the occupation of China's Northern provinces, fiercer and more spectacular fighting was raging around the cosmopolitan commercial metropolis of Shanghai. Tension in Shanghai began to mount on August 8, after a Japanese naval officer and soldier were killed by Chinese police near the Hungjao aerodrome. In this, as in most other details about the origin of the hostilities, there is a discrepancy between the Japanese and Chinese versions. The Japanese assert that the officer and sailor were killed without provocation; the Chinese state that they endeavoured to force entrance into the aerodrome.

The situation became increasingly threatening as the Chinese moved considerable forces of armed police into the zone which was supposed to be demilitarized after the Shanghai fighting of 1932, while new Japanese warships arrived off Shanghai. Actual skirmishing between Japanese and Chinese patrols started on August 13. On the following day Chinese aeroplanes went into action for the first time, endeavouring to bomb the Japanese flagship, "Idzumo," and other warships in the Whangpoo river. A major tragedy occurred when bombs, accidentally released from the aeroplanes, fell in two of the most crowded sections of the International Settlement, killing over 1,200 persons, the vast majority of whom were Chinese.

During the first ten days of fighting around Shanghai the Japanese were heavily outnumbered and were definitely on the defensive. Their naval landing party, supported by the guns of the warships, experienced difficulty in holding the Hongkew and Yangtzepoo sections of the International Settlement, where most of the Japanese live. The first Army units disembarked near Woosung on August 23. On the same day another accidental bombing tragedy occurred when an aerial torpedo apparently of Chinese origin, fell on the large Sincere department store, killing 173 and wounding over 500 persons.

After the arrival of the Army reinforcements the initiative on the Shanghai front passed into the hands of the Japanese. However, the Chinese, throwing into the action many of their well trained Central Government units, defended themselves with great stubbornness and courage. Except for one strategic retreat, carried out in good order, about the middle of September, the Chinese line, resting with its left flank on the Yangtze river and its right on the International Settlement held very firmly for two months, despite the marked superiority of the Japanese in aircraft and in artillery.

A decisive turning-point in the struggle came on October 25,

when the Japanese battered their way into the village of Tazang, key point in the Chinese defence line. This made necessary evacuation of Chapei, the main industrial section of the Chinese part of Shanghai, which was almost completely destroyed, partly by the heavy bombing and shelling to which it was subjected, partly by the fires which the Chinese set during their retreat.

**The Chinese Retreat.**—The attempt of the Chinese to make a new stand along Soochow creek near the western outskirts of the Settlements was shortlived, partly because their morale was depressed by the very heavy losses among their best divisions, partly because the Japanese threatened their right flank and rear by carrying out a landing near Chapoo, on Hangchow bay, early in November. By November 12 the Chinese were in full retreat from the environs of Shanghai.

Within a month the Japanese had swept over the stretch of 180 miles between Shanghai and Nanking. Strong intervening lines of defence, notably one running through Kiangyin and Wusih were abandoned with little resistance. The first real stand was made at the outskirts of Nanking; and several days of fighting were necessary before the Japanese completed the occupation of the Chinese capital on December 13. Wuhu, a town further up the Yangtze river, had already been taken.

**Results of the War.**—Judged from a purely military standpoint, the war up to the end of 1937 represented a clear-cut victory for Japan. Approximately 400,000 sq.mi. of Chinese territory had been occupied; the Japanese in the North had reached approximately the line of the Yellow river, while in Central China the Japanese flag flew over Nanking, the nationalist capital, and Shanghai, China's largest port and industrial centre. The Chinese air force had been largely put out of action, although the arrival of new aeroplanes from Russia was being reported in November and December.

Estimates of losses have been confused and contradictory; but it is doubtful whether Japan's casualties, in killed and wounded, during 1937 were much in excess of 100,000. Chinese losses were at least four or five times as heavy and were all the more keenly felt because it was largely the relatively good, modern trained units that were decimated in the fighting around Shanghai. One of the weakest spots in the Chinese preparation for war was the organization of military hospitals and care of the wounded. Con-

MAP OF EASTERN CHINA showing the Tientsin-Peiping and Shanghai-Nanking areas where fighting centred. It will be noticed that the two fronts are nearly 1,000 miles apart

# CHINESE-JAPANESE WAR

sequently an abnormally high percentage of the Chinese wounded either died or suffered permanent disability.

While the Chinese displayed more nationalist spirit and fought harder than in any previous clash with Japan, certain Japanese points of military superiority proved of decisive significance in determining the outcome of the operations during the first months of the war. The Japanese Army was a modern military organization, responsive to centralized command. The Chinese Army, on the other hand, was a heterogeneous combination of some fairly well equipped and trained divisions, subordinated to the Central Government, with masses of raw provincial levies, untrained in modern warfare and owing allegiance to individual "warlords," or governors of provinces, rather than to the Central Government.

Especially in the North, the semi-independent status of such provincial governors as Han Fu-chu, in Shantung, was an almost insuperable obstacle to the carrying out of a unified plan of defence. In the Shanghai-Nanking area, where the problem of the autonomous warlord was not so serious, the Chinese fought under the disadvantage of facing an opponent tremendously superior in artillery and air power. While the Chinese soldiers in many cases displayed great courage, holding their positions during days and weeks of heavy bombardment, the quality of their staff work and intelligence service was definitely inferior.

Japan's military victories by the end of the year had not led to the capitulation of the Chinese Government. The capital was transferred from Nanking to remote Chungking, in Szechuan, about the middle of November. Government offices were distributed among several towns, including Hankow, chief city of the Middle Yangtze and Chang-sha, in Hunan Province. Generalissimo Chiang Kai-shek issued several public statements professing an intention to fight to the end.

**International Aspects.**—Any war affecting China is almost certain to arouse international complications, because of the number and complexity of foreign interests in that country. Apart from questions of trade and investment, certain foreign loans are secured by assignments from the customs revenue; there are foreign residential areas, of which the International Settlement and the French Concession at Shanghai are the largest, which are not under Chinese administration.

The United States and those European countries which enjoy extra-territorial rights in China have stationed troops in Peiping and Tientsin under the terms of the Boxer Protocol and since 1927 several foreign powers have kept troops in Shanghai. It has also been a practice of American, British, French and other foreign warships and gunboats to stand off Chinese coastal and river ports to afford protection and refuge to their nationals in periods of stress and commotion.

The immediate reaction of the outside world to the outbreak of hostilities in North China was one of relative apathy and aloofness. The time was not propitious for foreign intervention. Great Britain was pre-occupied in Europe. The United States seemed committed to an isolationist foreign policy. The Soviet Union, by withdrawing troops from two disputed islets in the Amur river after one of its gunboats had been sunk by Japanese batteries, had given clear indication of unwillingness to fight, except in absolute self-defense.

The American Secretary of State, Mr. Cordell Hull, on July 16 issued a general statement of principles which America considered applicable to international affairs. Most governments expressed agreement with this statement, although Japan added a significant reservation, referring to "actual peculiar circumstances of the Far East."

On Aug. 26 the British Ambassador to China, Sir Hughe Montgomery Knatchbull-Hugessen, while motoring from Nanking to

MOTION PICTURE CAMERA records crash of bombing Japanese warplane (at right and above smoke cloud), shot down by Chinese at Nanking

Shanghai, was wounded by a machine-gun bullet fired from an aeroplane which British officials who were in the automobile described as Japanese. A British protest delivered to the Tokyo foreign office on Aug. 29 emphasized the general illegality and inhumanity of the act and requested an apology, punishment of the individuals responsible for the shooting and assurances against similar acts in the future. After a protracted investigation the Japanese Government, in a note of Sept. 20, admitted that "the incident may have been caused by Japanese planes which mistook the Ambassador's motorcar as a military bus or truck," expressed deep regret, promised "suitable steps" if the guilt of Japanese aviators should be established and declared that "instructions have been sent again to the Japanese forces in China to exercise the greatest care in safeguarding noncombatants."

The Advisory Committee of the League of Nations, created at the time of the dispute over Manchuria, condemned "the bombing of defenseless Chinese towns by Japanese aeroplanes" on Sept. 28. President Roosevelt in a speech at Chicago on Oct. 5 strongly condemned "aggressor nations" and urged "peaceloving nations to make a concerted effort in opposition to the violations of treaties."

On the following day the American State Department accused Japan of violating the Kellogg Pact and the Nine Power Treaty. The League of Nations Advisory Committee adopted a resolution to the same effect and proposed a conference of signatories of the Nine Power Pact.

This conference, held at Brussels during the first part of November, led to no positive results, because no delegation of the participating powers, except the Chinese, proposed any program of concrete action. Japan twice declined invitations to take part in the conference, adhering to its general principle of insisting

on a direct settlement of the conflict with China.

New serious international incidents occurred on Dec. 12. The United States gunboat "Panay" and Standard oil tanker were sunk in the Yangtze river by bombs dropped from Japanese naval aeroplanes. Three Americans and one Italian were killed and some fifteen were wounded. American feeling was further inflamed by reports of machine-gun fire from Japanese Army launches, directed against survivors who were escaping in boats. The Japanese Government offered apologies and indemnification and promised "to deal appropriately" with those responsible for the bombing. An American note, published on Dec. 15, demanded from the Japanese Government "an assurance that definite and specific steps will be taken which will insure that hereafter American nationals, interests and property in China will not be subjected to attack by any Japanese armed forces whatsoever." Shelling of the British warships "Ladybird" and "Bee" and of some British commercial vessels by Japanese shore batteries at Wuhu on the same day, Dec. 12, elicited a stiffly worded protest from the British Government.

The "Panay" case was settled after an exchange of notes between the Japanese and American Governments on Dec. 24 and 25. The American note accepted the Japanese expressions of regret and promises of indemnity, punishment of the guilty and intensified precautions against future incidents of this nature, while expressing belief in the findings of the United States Navy Court of Inquiry which was set up to investigate the matter. There were official complaints of depredations in American property in Nanking by Japanese troops in January; and the American consular official in charge of the embassy at Nanking, Mr. John M. Allison, was slapped by a Japanese soldier while investigating one of these cases on Jan. 26. American remonstrances were followed by official Japanese assurances of regret, investigation and punishment.

Japanese military activity, which subsided for a time after the capture of Nanking, was renewed with the crossing of the Yellow river and the occupation of Tsinan-fu, capital of Shantung province, on Dec. 26. Tsingtao, the most important port in Shantung, where the Chinese in December had destroyed Japanese mills valued at 250,000,000 yen, was taken on Jan. 11. Further Japanese activity during January consisted mainly of a northward push from Nanking and a southward push from Tsinan-fu along the line of the Tientsin-Pu-kow railway. The converging Japanese movement was directed against Hsueh-fu, an important junction point where the Lunghai railway intersects the Tientsin-Pu-kow railway.

Japanese peace offers to China through the medium of the German ambassador to China, Dr. Oskar P. Trautmann, yielded no positive results; and on Jan. 16, after a conference of high military and civilian officials in the presence of the emperor, the Japanese Government announced its intention to cease dealing with the Chinese National Government.

The Chinese ambassador, Mr. Hsu Shih-ying left Tokyo soon after this declaration.

The Japanese ambassador, Mr. Shigeru Kawagoe, returned to Japan from Shanghai.

## Christian Science.

For the Christian Science movement, including its Mother Church, the First Church of Christ, Scientist, in Boston, Mass., and the branches throughout the world, 1937 was a period of steady progress. This was the case, not only in the United States, but also in other countries. In proportion to previous numbers, the movement had its largest growths last year in Australia and in Great Britain.

Mary Baker Eddy, having founded the original Church of Christ, Scientist, in Boston, in 1879, the number of Christian Scientists in the United States continues to exceed the number in all other countries, but within the United States the conspicuous growth of the Christian Science movement has moved westward from New England to the Pacific coast. Of the United States, California now has the largest number of Christian Scientists. In this State there are 274 Christian Science churches and societies, besides 11 organizations at colleges and universities, and not less than 1,990 Christian Scientists who make the practice of Christian Science Mind-healing their ministry or vocation.

In the United States and Canada, and to some extent in other countries, the Church of Christ, Scientist, has made an increased use of radio as a means of making Christian Science correctly known to the public. This broadcasting has included church services, devotional programs, the "Columbia Church of the Air," lectures, and transcribed interviews with prominent Christian Scientists. Likewise, *The Christian Science Monitor* has continued to develop its broadcast, "The Monitor Views the News," which consists of editorial comments on important news of general interest.

In Great Britain, the Earl Marshall summoned a delegate representing the Church of Christ, Scientist, to attend the coronation of King George VI and Queen Elizabeth. The delegate nominated by the Christian Science Board of Directors in Boston attended this ceremony with other religious representatives. In Germany, the Christian Science movement encountered more than a few difficulties made by the Hitler Government, but has continued a normal growth. First Church of Christ, Scientist, Berlin, completed and occupied its new edifice in 1937.

(C. P. S.)

**Christian X** (1870— ), King of Denmark and Iceland, K.G., nephew of Queen Alexandra of Great Britain, succeeded his father, Frederick VIII, in 1912, having been crown prince since 1906. One of the most democratic and popular of monarchs, a trained soldier, excellent shot, and experienced seaman, his silver jubilee was enthusiastically celebrated at Copenhagen and throughout his kingdoms and the Danish settlements in Greenland on May 15, 1937. The king married, in 1898, Alexandrine, Duchess of Mecklenburg, and by her has two sons.

**Chromite.** For a material with so diversified a list of uses, chromite showed an unexpectedly large depression drop in output, a decrease of 53% from a high of 635,000 metric tons in 1929 to a low of 298,500 tons in 1932; rapid expansion in new uses led to a quick recovery, and the 1934 output was only 5% below the 1929 high, while 1935 exceeded this by 28% for a high record of 813,000 tons; this in turn gave way for another record figure of 983,000 tons in 1936, and preliminary reports indicate that another record high may be made in 1937.

The feature of these new record figures is the increases in output shown by South Africa, Turkey, and the Soviet Union, while Cuba, Greece, Japan, and Yugoslavia have shown smaller gains. The rapid gains made in these countries have prevented Southern Rhodesia from regaining her former outstanding position, and while the New Caledonian output also still stands lower than in

World Production of Chromite  
(Metric tons)

	1929	1932	1934	1935	1936
Cuba . . . . .	53,799	500	50,160	48,509	71,086
Greece . . . . .	24,214	1,555	30,694	29,779	47,954
India . . . . .	50,361	18,190	21,921	39,753	59,276
Japan . . . . .	9,163	12,492	19,897	27,222	36,309
New Caledonia . . . . .	52,594	69,429	55,182	55,311	47,839

Total . . . . .	635,200	298,500	603,100	813,000	983,000

1929, accumulated stocks were drawn on in 1936, and exports showed an increase.

The chief factor leading to the increased outputs of the last few years is the rapidly increasing demand for chromium alloy steels, particularly the so-called stainless steels, and for non-ferrous chromium alloys, with some improvement also in the use of chromite refractories. (See also COBALT.)

The United States produces only a few hundred tons of chromite, but up to 1932 consumed well over half the world's output; since then the new developments have shifted more of the consumption to other steel-making countries, and the United States consumption has dropped to less than one-third of the total output.

(G. A. Ro.)

Chronology: see CALENDAR OF EVENTS, 1937, PAGES 1-14.

Church Membership. The religious bodies of the United States, as a whole, despite the economic recession of late 1937, show a steady increase in churches and membership. Government census statistics show that while the population growth of the nation has been .6 of 1%, the church membership growth has been an even 1%. Out of 87,160,604 citizens in the country, 51,745,907 persons, or 59.3% are members of churches and synagogues.

This of course does not mean 100% attendance at religious services, nor 100% support of religious organizations. The Northern Baptists, for instance, report that 23% of the members do all the work and that 54% of the members contribute nothing. The figures probably hold true for other larger Protestant denominations.

The Roman Catholic Church remains the largest in point of numbers, with a membership of over 20,000,000. The largest single Protestant denomination is the Southern Baptist group, with 4,482,315. Next year's figures will show the Methodist Church in first place among Protestants. The merging of the Methodist Episcopal, Methodist Episcopal South, and Methodist Protestant Churches will produce a membership of nearly 8,000,000.

The latest reports available list the churches and their memberships as follows:

Totals: . . . . . 239,211 80,800,786  
(Table by courtesy of Mr. Herman C. Weber, Editor,  
Yearbook of American Churches.)  
(F. S. ME.)

Great Britain.—Except in the cases covered by the notes hereto, the following table gives, to the nearest hundred, the membership of the various churches as officially stated in the annual reports or at the annual conferences of 1937.

Church of England . . . . .	2,382,900 (a)
Roman Catholics . . . . .	2,400,000 (b)
Presbyterian Churches:	
Scotland . . . . .	1,288,600
Wales . . . . .	182,200
Ireland . . . . .	113,800
England . . . . .	81,700
United Free, Scotland . . . . .	21,800
Baptists . . . . .	392,500
Baptists, Strict and Particular . . . . .	20,000
Congregational:	
Union of England and Wales . . . . .	424,800
Union of Scotland . . . . .	40,500
Union of Ireland . . . . .	2,200
Methodist Church . . . . .	829,000 (c)
Salvation Army . . . . .	222,100 (d)
Society of Friends . . . . .	19,300 (e)

- (a) Actual communicants, for England only, as at Easter, 1936.
- (b) The Catholic estimate of the total number of members of the Roman Catholic Church in England and Wales only.
- (c) Members and probationers in Great Britain.
- (d) Employees only, the vast majority of whom are unpaid; they include officers, cadets, missionaries, bandsmen, songsters, etc.
- (e) Membership in Great Britain only.

Church of England. In England only, the number of communicants at Easter, 1936 (the latest period for which statistics are available) numbered 2,382,857, a decrease of 59,086 on the total for the previous year. Pupils on the registers of Sunday schools numbered 1,546,007, a decrease of 82,688 and the largest falling off reported for five years. There were 12,681 incumbents, and the churches and mission buildings normally provided accommodation for 6,151,831 worshippers.

Qualified men and women on the electoral rolls of parishes totalled 3,559,926, a decrease of nearly 40,000 on 1935. It is of special interest to note that baptisms in 1935 were 57

per 1,000 live births, and that this proportion had in 1936 increased to 59, 382,882 infants being christened. Candidates for confirmation declined from 197,447 in 1935 to 182,738 in 1936.

Voluntary offerings actually raised by parish organizations and church collections entirely for parochial purposes amounted to £5,037,477, a decrease of £28,589 on the previous year. The budget of the central board of finance, approved by the church assembly at its summer session, provides for an estimated expenditure in 1938 of £145,000 for the general purposes of the Church of England, such as contributions to the clergy pensions scheme; grants for religious education; central loan fund, etc.

The diocesan boards of finance received the sum of £600,541 for the broad needs of the church in their respective dioceses.

In 1937, 19 churches were built or rebuilt and consecrated, partly as the result of the inauguration of the central loan fund. For the purposes of this fund credit facilities for £515,000 were obtained, and applications amounting to £501,160 were received from 29 dioceses. The dioceses are not asked to pay interest on the loans granted, but have to repay the capital sum borrowed in as short a time as possible, in any event within 20 years. The ecclesiastical commissioners are able to make a grant up to £10,000 a year for 20 years to be set against the interest charged by the bank on money advanced for the purposes of the central loan fund.

**Ecclesiastical Commission.**—The total number of poor benefices permanently augmented or endowed by the ecclesiastical commissioners out of their common fund has been increased to nearly 9,400 by grants secured during 1937. The total annual value of the additional provision for the cure of souls in parishes in England is now more than £2,354,000. The commissioners are faced with the prospect of serious reduction of income as a result of the tithe act and of the coal bill introduced on Nov. 10. The annual loss under these two proposals will be, it is estimated, nearly £200,000.

**The New Church House,** which is being built at Westminster, is making rapid progress, the foundation-stone having been laid by Queen Mary in June. Owing to the rebuilding, the church assembly has held its meetings at the Central hall, Westminster (Methodist). The library at Church house is to become a record office for the synodical and constitutional acts of the entire Anglican communion.

**Church and Films.**—The cinema Christian council entered into an agreement with the Religious Film Society, whereby the council will undertake the propaganda and advisory side of the

THE ARCHBISHOP OF CANTERBURY, primate of all England

work, leaving to the Religious Film Society the practical tasks of production and distribution. During 1937 a new organization, known as the Church Film Society, was formed.

**Church Assembly.**—Sessions of this, the national assembly of the Church of England, were held as usual in February, June, and November. Among the more important reports presented were the second report of the commission on the law relating to faculties, the first report of the commission on parochial endowments, and the report of the social and industrial commission on church and youth.

At the autumn session, the assembly decided on a policy of concentration for the training colleges for women teachers, whereby the colleges at Brighton, Truro, and Peterborough are to be closed.

**The Church and Marriage.**—This has been one of the chief questions of the year. It was discussed in January at the convocations of both Canterbury and York, the chief resolutions embodying the principle that, when two persons have contracted a legal marriage during the lifetime of a former partner of one of them, or of their former partners, they should not be baptized or allowed to partake of the Holy Communion until the parish priest has informed the bishop of the diocese of the facts. The bishop shall then give directions in writing as to whether the person or persons shall or shall not be repelled from the sacraments.

The question of the marriage of divorced people in church has also been discussed, and the church assembly, at its autumn session, welcomed "the considered judgment of the convocations concerning the inadmissibility of the use of the prayer book marriage service for the remarriage of any person whose original marriage has been civilly dissolved, but whose original spouse is, at the time of such proposed remarriage, still living." Sir Francis Acland, M.P., in December announced his intention of leaving the Church of England because of its attitude towards marriage. (See also *DIVORCE: Great Britain.*)

**Cathedral Commissioners.**—During the year 25 schemes framed by the cathedral commissioners were confirmed by orders in council, and a measure was promoted for dealing with the Cathedral Church of Southwark. The amount of assistance given to cathedrals out of the common fund of the ecclesiastical commissioners was £14,081.

**Religious Education.**—As the result of conferences held in January and July, an important policy was adopted for Sunday schools. This concerned a new approach in the teaching of "over-elevens" along the lines of methods used in the senior day schools with the development for those children of guilds, companies, or clubs. In November a scheme of home religious teaching by post was launched for children who do not attend Sunday school.

**Anniversaries.**—A service on the anniversary of the laying of the foundation-stone of Guildford cathedral was held by the archbishop of Canterbury in July, and Truro cathedral jubilee services took place in November. The 300th anniversary of the Ancient Society of College Youths (bellringers) was celebrated in London.

**Church Reunion.** If no tangible steps have been taken in the actual welding of churches in Great Britain, such as the blending of the Congregationalists, Presbyterians, and Methodists in the United Church of Canada, progress has yet been made in co-operation of effort between different denominations, especially on new housing estates—where an understanding is often reached between one body and another, and under the chairmanship of the Bishop of Southampton, a body known as The Friends of Reunion has been established, pledged to work for unity of the Christian Church.

At its annual assembly at Bristol, the Congregational Union (see *CONGREGATIONAL CHURCH*) discussed reunion and the possi-

bility of forming a united Oecumenical Church with Baptists and Presbyterians. The report of a special committee dealing with the subject was presented at the annual assembly of the Baptist Union at Manchester in April, but baptism itself raised one difficulty, and the method of administering the Communion another.

In July, a world conference on Church, Community, and State, presided over by the archbishop of Canterbury, took place in the Sheldonian theatre, Oxford, its object being to attempt to discover, by interchange of views among various sections of Christian thought, what are the main questions confronting the Church in the modern world. There were representatives from India, the United States, China, and many European countries.

The world conference of Faith and Order was held, under the presidency of the archbishop of York, in Edinburgh in August, when some 414 delegates from 122 Christian communions in 43 different countries met. Among those who attended were Chinese, Japanese, Indians, and Negroes.

A Parliament of religions—Christian, Moslem, Hindu, Parsi, Sikh, etc.—was held at Calcutta early in March. The president was Sir Brojendranath Seal; many countries, including Great Britain and the United States, were represented, the former by Sir Francis Younghusband and the latter by Colonel Lindbergh.

**Ciano, Galeazzo** (1903— ), Italian minister of foreign affairs since 1936, is the son of Count Costanza Ciano, a naval officer of note, former minister of communications, and president of the Chamber of Deputies.

The young Count started public life as a diplomatist, becoming secretary at one of the South American embassies, then consul-general at Shanghai; in 1934, he married Mussolini's daughter, and in the same year became minister of propaganda and press director, but from the outbreak of the Italo-Abyssinian War served in the air arm and became leader of the "Desperata" squadron of bombing planes, gaining a reputation for ruthless efficiency.

As foreign secretary, Count Ciano during 1937 was negotiator of many pacts and agreements (*see* ITALY) and took part in various "Non-intervention" discussions. In January, he was concerned in the Gentlemen's Agreement with Great Britain, and later in the same month had conversations with General Göring, the German air minister; in March, at Belgrade, he initialled a political agreement with Yugoslavia (*q.v.*), a trade agreement having been previously concluded; in May, he accompanied King Victor Emmanuel III on an official visit to Budapest, where, in conversations with the Hungarian ministers, the political and economic situation in central Europe was discussed and complete harmony attained; and in June he had conversations with Field-Marshal von Blomberg, the German war minister. On Nov. 6, with Herr von Ribbentrop (Germany) and Mr. Hotta (Japan), he signed the Anti-Communist Pact.

**Cigars and Cigarettes.** In the United States, details for the first nine months of 1937 show that the American consumption of cigarettes amounted to 123,336,525,174, an increase of 8,176,682,441 over the same period of the previous year. The per capita consumption of cigars is only .97lb. as compared with 1.33lbs. in 1900, but the total consumption is now 124,000,000lbs. as compared with 101,000,000 lbs. 37 years ago. Production figures for the first nine months of 1937 are given as 971,024,593, which show a gain of 199,651,252 over the same period of the previous year.

America's total per capita consumption of tobacco has, however, been on the down grade since 1920. At the moment the per capita figure in the United States is practically 7lbs. The chief feature in the British market during the year 1937 has been the steady and continuous growth in the amount of tobacco entered

for home consumption, amounting to 151,209,340lbs. for the ten months' period ending Oct. 31, as compared with 144,815,216lbs. and 137,062,993lbs. in the comparative periods of 1936 and 1935. Approximately 77% of this is consumed in the form of cigarettes, 99% of which are made exclusively from flue-cured tobacco imported from the United States, while the introduction of new 4d. brands of full-sized cigarettes containing a proportion of Empire leaf has been in a measure responsible for an increase in leaf imports from Empire countries. The per capita consumption is 3.71lbs., which is about the fourth highest rate of per capita consumption among European countries, although materially lower than the rate in the United States. Cigar consumption has gradually decreased, and today is only three-fifths of what it was 30 years ago.

In spite of a small recovery lately, cigars account for less than 1% of the total consumption.

All over the world a similar decline in cigar smoking is noted, the latest details from Havana showing that exports to all countries during the first eight months of 1937 were 24,380,740, as against 30,562,056 in the comparative period of 1936, while each year cigarettes, especially Virginia types, gain new converts, and all indications are that this movement will continue at the expense of other forms of smoking. **Citrine, Sir Walter (McLennan),** K.B.E. (1877— ), British Trade Union official, born in Liverpool, started life as an electrician. A district secretary of the Electrical Trades Union from 1914, he became assistant general secretary in 1920, and in 1924 was elected assistant secretary of the Trades Union Congress, becoming secretary in 1926. Since 1928 he has also been president of the International Federation of Trade Unions (16,000,000 members), and its conference at Warsaw, July 1-3, 1937, was held under his chairmanship. Citrine is a director of the *Daily Herald*, a member of the Court of Governors of the London School of Economics, and chairman of the World Non-sectarian Anti-Nazi Council. He has written much about trade union and wider problems, his latest publication being *I Search for Truth in Russia*. He has travelled extensively for the furtherance of international trade unionism, twice visiting the United States to lecture.

One of the most polished speakers of British Trade Unionism, he is regarded in many quarters as its leading intellect. He was knighted 1935.

**Civil List.** In Great Britain, the accession of a new sovereign in Dec. 1936 made necessary the introduction of a new civil list to provide for the maintenance and expenses of the Crown; this was done, after a select committee had issued a report (May 3), by the chancellor of the exchequer in the House of Commons on May 24; the bill was given a third reading on June 1, all amendments having been negatived, and on June 10 received the royal assent.

The total of the civil list itself remained at the same figure as that arranged for the previous Sovereign, Edward VIII, had he been married, and was made up as follows:

	£
His Majesty's privy purse.....	110,000
Household salaries and retired allowances.....	134,000
Expenses of household.....	152,800
Royal bounty, alms, etc.....	13,200
	<hr/> £410,000

The revenues of the Duchy of Cornwall which, in default of a Duke of Cornwall, are vested in the Crown, were estimated to amount in 1937 to £106,000; from this are paid the annuities of the Princess Elizabeth and the £10,000 granted to the Duke of Gloucester in addition to the £25,000 he receives as a younger son of George V, in respect of the duties he performs as representing the heir, the balance going to reduce the amount payable from the consolidated fund to the civil list.

Grants made to other members of the Royal family are as follows:

	£
H.M. Queen Mary.....	70,000
The Princess Elizabeth.....	6,000
The Duke of Gloucester.....	35,000
The Duke of Kent.....	25,000
The Princess Royal.....	6,000
The Princess Louise.....	6,000
The Duke of Connaught.....	25,000
The Princess Beatrice.....	6,000
H.M. the Queen of Norway.....	6,000

In the event of widowhood, H. M. Queen Elizabeth is to receive an annuity of £70,000, and the Princess Elizabeth, on attaining the age of 21, unless at that time there is a Duke of Cornwall living, an additional £9,000 per annum.

**Civil Population, Protection of.** The organization of the steps to be taken to protect the civil population of Great Britain in the event of air raids is entrusted to the Home Office, Air Raid Precautions department, which was set up, perhaps belatedly, in May 1935. The issue of warnings to the population, and the execution of the steps necessary to protect it, are the responsibilities of the local authorities, who will themselves be warned, when danger is impending, by civilian observers working from the air ministry's intelligence centre. There has been considerable delay in the final preparation of plans owing to a prolonged dispute between the Government and the local authorities as to the apportionment of the costs to be incurred, but at the close of the year Parliament had before it an air raids precaution bill to regulate this matter. In the meanwhile the department has not only worked out the organization of protection, but has also done a great deal of educative work in arranging courses of instruction in anti-gas treatment for doctors, police, and volunteers from the general public, and also in other aspects of "passive defence."

There are three types of danger to be met: high explosive bombs, wide-spread fires due to incendiary bombs, and the dropping of bombs containing poison gas or, alternatively, the spraying of poison gas from aeroplanes. The first problem is being virtually ignored on account of cost: the home secretary has stated in the House of Commons that the cost of erecting shelters against direct hits would be about £1,500,000,000; and the only precautions contemplated were against splinters. Public shelters are to be provided, and instructions about shelter-rooms to be issued to householders. The number of high-explosive bombs which an aeroplane can carry is limited; the more the population is dispersed, the safer it is, and one of the best precautions is to stay at home; and the official view appears to be that the incendiary bomb is the most universally dangerous. A medium bomber can carry enough incendiary bombs to start 150 separate simultaneous fires, and all the usual fire-fighting appliances fail, as water is useless

for the purpose till the contents of the bomb are exhausted. Four inches of reinforced concrete will provide safety, but apart from this, dry sand will prevent fires from spreading, and removal of inflammable materials from attics and top-floors is a valuable precaution. The official precautions will be to provide a hand-pump, a shovel, and a box of sand, and to send fire-fighting machines on frequent patrol.

Gas is the danger perhaps most widely feared. The first protective step is the provision of gas masks, which are completely effective except against the blister gases. Germany, unlike Great Britain, seems unlikely to provide the population with respirators on the score of expense. Further necessary steps to be taken are instruction in the use of protective clothing and in the preparation of gas-proof rooms (which, contrary to common opinion, can quite easily be improvised), while local authorities will organize properly trained decontamination squads to destroy persistent gases and to isolate contaminated areas. The steps taken cannot in any event be complete; they can only mitigate the danger, not remove it. And there are several problems unsolved, notably the question of the evacuation of civilians from dangerous areas, and the finding of a type of gas mask suitable for children under three. (See also **CHEMICAL WARFARE.**) (W. T. WE.)

**Civil Service.** The principal developments in civil service during 1937 included substantial extensions of the merit system in States and cities, balanced by the failure of Congress to fulfill platform pledges to extend the civil service of the Federal Government; the continued development of in-service training and placement programs, and public-service apprenticeships; the drive for public employee associations, especially in the State and local areas; the launching of a movement to establish professional standards for personnel administrators and technicians; and the recommendations of the President to replace the U.S. Civil Service Commission by a Personnel Administrator, to extend the merit system "upward, outward, and downward" and to develop civil service procedures toward a career service.

The public demand for extension of the merit system gained headway during 1937. Five States, Arkansas, Tennessee, Michigan, Connecticut and Maine, enacted State-wide civil service laws, the largest number to adopt the merit system in any single year in the history of merit legislation. In 29 States the newly organized unemployment compensation offices have been placed under the merit system and in most States also the bureaus of old-age assistance. The Civil Service Assembly reports that during the two-year period ending Dec. 31, 1936, 57 new city civil service commissions were established in addition to extensions under existing commissions. During 1937 28 cities and four counties adopted the merit system. Enabling legislation for city merit systems was enacted in North Dakota, South Dakota and Kansas; for police merit systems in Washington and West Virginia. Several notable appointments to key personnel positions in the States and the temporary loan of other technicians indicated a trend to waive the local residence rule. Within the States and their subdivisions, therefore, the extension of the merit system went forward on a substantial scale.

During the first session of the 75th Congress (January to August) and the special session (Nov. to Dec. 1937) the President's recommendations for extension of the merit system to all but policy-forming positions, including postmasters, were awaiting action. Not only did Congress fail to endorse the President's recommendations; but a number of laws were enacted increasing the number of patronage positions. The Housing bill became law exempting all positions paying more than \$1,980. On the other hand, the Labor department established a well-organized

relief bill. The city Administration transferred what funds it could to unemployment relief but at no time was sufficient cash available to care for all the needy.

**Banking and Finance.**—In the financial field, the outstanding event of 1937 was the change in ownership of the so-called Van Sweringen rail empire, consisting of the Chesapeake & Ohio, the Erie, the Nickel Plate and allied railroads. On March 8, George A. Ball of Muncie, Ind., owner of a controlling interest, transferred his shares to the George and Frances Ball Foundation which, on March 26, sold the shares to Robert P. Young and Frank F. Kolbe of New York and Allan P. Kirby of Wilkes-Barre, Pa., at a price of \$6,375,000. On April 5, Charles A. Bradley of Cleveland was elected president of the Alleghany Corp., top holding company of the Van Sweringen structure. The Interstate Commerce Commission, Dec. 29, approved the application of the Chesapeake & Ohio Railway Co. to acquire outright control of the Erie and the Nickel Plate railroads. On the same day, George D. Brooke of Cleveland was elected president of the Chesapeake & Ohio to succeed W. J. Harahan who had died on Dec. 14. The acquisition of the Erie and the Nickel Plate by the Chesapeake & Ohio conformed to the four-system plan promulgated by the Interstate Commerce Commission in 1932. It would bring under common control 9,287 mi., or 72.36%, of the Chesapeake & Ohio-Nickel Plate system proposed at that time by the commission.

Efforts to effect a satisfactory plan for the re-opening of the Union Trust Co. of Cleveland continued throughout the year. On Dec. 27, a list of 80 men who had consented to act as sponsors for the new bank, to be called the Union Bank of Commerce, was announced. Court approval of the plan was sought. Reorganization of the directorate of the Cleveland Railway Co., which operates the street car system of the city, was accomplished after all the directors had resigned on Sept. 10. The new board, which consisted of a majority of the old members, received the resignation of Paul Wilson, president of the company, on Sept. 24, and elected Frank R. Hanrahan as Wilson's successor on Oct. 8.

**Labour.**—Strikes, with attendant riots and other disorders, were numerous in Cleveland in the spring and summer of 1937. A strike of the van drivers on March 1 was followed by a series of others including those at the Fisher Body plant, May 13, and at the Industrial Rayon Plant on May 17. The C.I.O. lost the election in the latter strike, July 17, and a settlement was effected. Serious rioting occurred July 26 at the Corrigan-McKinney steel works where a strike was in progress, on Aug. 5 at the Bamberger Reinthal Knitting Mill and on Aug. 6 at the Cleveland Knitting Mills. Police and Ohio National Guardsmen were called upon to quell those disorders.

Investigations of charges of labour racketeering occupied the attention of the Director of Public Safety, Eliot Ness, much of the year. Harry Barrington, carpenters union business agent, was indicted by the grand jury on charges of extortion, March 15. Barrington was arrested in Los Angeles, Aug. 24, returned to Cleveland and pleaded guilty, Oct. 25. His sentence was one to five years in the State penitentiary. On Nov. 17, after four months devoted to the accumulation of evidence, Ness made it known that he had turned over to the county prosecutor's office, full details of charges that other labour union officials had threatened to tie up building projects in Cleveland unless they were paid various sums. Scores of business men testified before the grand jury which on Dec. 20 indicted four labour leaders.

Safety Director Ness' office also was active in the prosecution of police officers who had been accused of accepting bribes during the prohibition era. Deputy Police Inspector Edwin C. Burns was tried and convicted on five counts in indictments for receiving bribes for the protection of bootleggers. Police Lieut. John H.

Nebe was tried for bribery and found guilty. The convictions of Burns, Nebe and Police Captain Michael J. Harwood, who had been found guilty at a trial in 1936, were upheld by the fifth district court of appeals and their sentences to serve two to 20 years in the State penitentiary were confirmed. (P. By.)

**Climate:** see METEOROLOGY.

**Clothing Industry.** Developments in the clothing industry in 1937 revolved around two outstanding occurrences, the increases in production costs and greater unionization of all branches in the industry. This led to methods whereby the producer may economize, and, in consequence, the straight-line system, with its framework of time-saving motions and its corollary of simplification and quantity output at the lowest possible cost, saw wider adoption.

The straight-line system, providing for a continuous series of operations, one succeeding the other in an unbroken flow of cumulative work, undoubtedly played an important part in the spread of mass production in 1937. Its increased usage in that year may be held to be one of the major developments. In the acquisition of specialized, single motor machines, there was further indication of the direction which the clothing industry has taken. These specialized machines, in view of the fact that they can be shifted in the factory, provided that flexibility without which the straight-line system cannot function. But even more important, the machines laid a positive foundation for the scientific and accurate estimation of costs. They called into being those twin elements of quality and quantity absolutely indispensable to the successful completion of profitable mass production.

In consumer trends there was an increase in the use of cotton suits for summer wear, with a corresponding decrease in woollens and worsteds. A dwindling demand for boys' overcoats was compensated for by a shift on emphasis to Mackinaws; while an enormous acceleration in the demand for sportswear saw the prominence of such heretofore lagging items as ski suits.

Up to and including Nov. 1937, with only about 20% of the clothing industry in the United States reporting, 17,781,906 units wholly or partly of wool in men's, young men's, and boys' garments were cut. This compares with 21,173,194 units for a similar percentage of the industry for the entire year of 1936. Value of manufactured clothing reached \$1,125,000,000 in 1936, and for the period ending Nov. 1937, the value is close to \$1,000,000,000. On an estimated markup of from 33½ to 45%, retail value of the manufactured clothing in 1936 was more than \$2,000,000,000 of the total value of retail goods in the United States, and this figure is matched with a total estimated at \$1,500,000,000 up to and including Nov. 1937.

While the census of 1935 recently made public does not indicate the trend in England, increases in the production of the ready-mades is apparent in the Board of Labour's figures for persons aged 16-64 who have been insured against unemployment in the clothing trades. Taking July 1923 as 100, the figure was 113.7 in 1935 and 114.5 in 1936, the last year of record.

In the main, it may safely be maintained that the year 1937 saw more science and less guesswork in clothing production.

(H. SN.)

**Cloves:** see SPICES.

**Coal Industry.** The United States coal industry as a whole suffered a decline of 41% from the 1929 high, as a result of the depression, and in 1936 had recovered to 80% of the former high. These figures are in rather marked contrast with the industry in the rest of the world as a whole, which declined only 21%, and had recovered to practically its former level. The

following table gives the coal production between 1929 and 1936 for all States contributing more than 5,000,000 short tons, which combined account for about 95% of the total. Preliminary reports for 1937 indicate a bituminous output of 440,265,000 tons, as compared with 434,070,000 tons in 1936, an increase of 1.4%, while anthracite dropped 8.5% to 50,091,000 tons, against 54,760,000 tons in 1936; this gives a total output of 490,366,000 tons in 1937, against 488,830,000 tons in 1936, an increase of only 0.3%.

United States Production of Coal  
(Millions of Short Tons)

	1929	1932	1934	1935	1936
Alabama .....	17.9	7.9	9.1	8.5	11.7
Colorado .....	9.9	5.6	5.2	5.9	6.8
Illinois .....	60.7	33.5	41.3	44.5	50.5
Indiana .....	18.3	13.3	14.8	15.8	17.4

Recovery in the bituminous industry has been fairly consistent since the low point of 1932, although the increase in 1937 was small, reflecting the recession in industrial activity during the latter part of the year; at the end of July production was over 10% ahead of 1936.

Anthracite made a good recovery up to 1934, since when conditions have been irregular, with the 1937 output down almost to the level of the 1932 low, due largely to increasing competition from oil and gas as household fuel.

Considering coal as a whole, Pennsylvania is the foremost producing State, but eliminating anthracite and comparing only on a bituminous basis, Pennsylvania has lost the leading position, and West Virginia has taken its place. These two States alone produce more than half of the total bituminous output of the United States. Distributed by fields, about 70% of the bituminous output comes from the Appalachian region (Pennsylvania, Ohio, West Virginia, Virginia, Eastern Kentucky and Tennessee), 20% from the Central region (Indiana, Illinois, Iowa, Missouri and Kansas), 6% from the Rocky Mountain and Western States, and 3% from the Southern field (Alabama).

Although there is some international trade in coal, the amounts are so small that practically the United States industry is self-contained; imports are usually under 1,000,000 tons and exports have ranged from a high of 24,000,000 tons in 1929 to a low of 10,000,000 tons in 1932, including bunker coal and the coal equivalent of coke exported.

Technologically, trends of importance are increases in stripping operations, mechanical loading, and mechanical cleaning, and improvements in safety conditions, reducing the fatality rate. Politically and economically the main feature of the year was the passage of the Guffey-Vinson Bill, the Bituminous Coal Act of 1937; little progress has been made as yet in the application of

the act, the full effect of which will not be felt until 1938.

(G. A. Ro.)

**Great Britain.**—The estimated output of coal for the year 1937, namely, 240 million tons, shows a very substantial increase over 1936.

This increase is due to a better home demand, especially by the heavy industries, and also to a small increase in the export trade.

Year	Output ooo Tons	Annual Change ooo Tons
1929. ....	258,000	..
1930. ....	244,000	—14,000
1931. ....	219,000	—15,000
1932. ....	209,000	—10,000
1933. ....	207,000	—2,000
1934. ....	221,000	+14,000
1935. ....	222,000	+1,000
1936. ....	228,000	+6,000
1937. ....	240,000	+12,000

It is well to remember, when considering the annual output of coal in Great Britain, that the science and art of coal utilization has made great strides in the past decade, and that the use of fuel oil has increased greatly.

For instance, in 1925 one ton of coal carbonized by a modern gas company produced 13,600 cu.ft. of illuminating gas, as well as 11.4gals. of tar, whereas today the figures are over 15,000 cu.ft. of gas and nearly 13gals. of tar. Since 1925 the quantity of electricity generated per ton of coal burned has been increased by 20%, and there has been at least a 10-15% increase in the efficiency of burning coal under boilers for steam-raising purposes. Therefore the annual amount of coal produced does not correctly indicate the relative state of trade over 10 years or more.

During the past 10 years there have been no great changes in the relative outputs from districts except in the exporting districts like Durham and South Wales, where a heavy drop occurred during the slump period.

In the older mining districts like Durham and the West of Scotland, many small mines have been abandoned, but the resulting loss in output has been overcome by the greater activity of the younger and larger mines. In other words, although the output from the various districts remains relatively constant, except where affected by trade conditions, there has been a definite shuffling within the districts themselves. This shuffling has been due partly to voluntary amalgamations within the districts as well as to the closing down of obsolescent mines.

During the year, there has been a steady increase in the number of men employed, the figures rising from 766,000 during the March quarter to over 780,000 for the last quarter of the year.

The principal increases have been in South Wales and Monmouth, Durham, and Scotland.

For the first time since 1929, there were more men employed in the second quarter of the year than in the first; usually the decline in the demand for household coal causes a diminution in labour in the Midland house-coal collieries.

The fact that the employment figures do not show any definite decline is interesting, in view of the extensive advances that are being made yearly in the use of machinery at the coal face.

The year 1937 has witnessed a definite expansion in the heavy industries, which is reflected in the increased demand for coal for home consumption.

The quota and supplementary allocations for imports of coal and other fuel into France reverted in the early months of the year to the level of the previous autumn, but were increased by 10% in March, during which month a new category known as the complementary quota was introduced.

BOOTLEG MINERS at work in Eastern Pennsylvania anthracite fields where 20,000 unemployed miners seized mining property and mined and sold about \$32,000,000 of coal annually

In Belgium the coal import licence tax was suspended and remained suspended on all coking coals throughout the year, but in May the quota restrictions were reimposed on other industrial and domestic coals.

The imports in the German customs area show little change, the increasing German demand for coal being met from other sources.

The export of coal to Italy was resumed in Jan. 1937, and

reached a figure of over 2,000,000 tons by the end of the year, as compared with 60,000 tons the previous year.

The Spanish trade dropped, in spite of the import duties being reduced at ports controlled by the Valencia Government.

The average declared value of coal sold has risen during the year from 14s. 7½d. per ton to 15s. 8d. This rise has been reflected both in the home and the export markets. The rise in the price of export coal was not pronounced in the early part of the year, but substantial increase took place in the later half, there being an average rise of 3s. per ton in Best Durham Gas Coal and 1s. 6d. in South Wales Large Steam in June and July.

An increase in price has also taken place in industrial coal, particularly in that supplied to public utility undertakings.

During the year under review substantial increases in wages became operative in most districts, due to percentages above the minimum being paid on the miner's basic wage in more than half the producing districts. It will be remembered that a miner's wages fluctuate with the prosperity of the industry. The principle is that, after certain definite items of cost have been taken into account, any difference between these and the realized value of the product is divided between owners and their employees in the proportion of 20 to 80. The employees are protected against very low wages in times of trade depression by the provision of a fixed minimum percentage addition to their basic wage.

In addition, new wages agreements were amicably negotiated in South Wales, Durham, Northumberland, North Derbyshire, and Yorkshire, whereby the majority of the employees obtained higher wages and/or an improvement in conditions of employment.

The average cash earnings per shift of all classes throughout the coalfields are estimated at 10s. 9d., or 9d. more than a year ago.

During the year there has been a decided rise in the price of colliery stores, especially timber and steel. The increased cost of pit timber, which comes principally from the Baltic, Scandinavia, and France, is partly accounted for by the rise in freights.

During the present year installation of underground machinery has continued its upward trend, and approximately 60% of the coal mined in Great Britain is now undercut by coal-cutting machines as compared with 31% in 1930. The increase applies to underground conveyors, the figure having risen from 17% in 1931 to 53% in 1937.

A steady rate of advance is also noticed in the provision of coal-cleaning plants. Thirty per cent of the total coal mined was washed in 1930, and today the percentage is 46%, the number of washeries increasing from 685 to 780, and in addition many of the existing washers have been enlarged.

The method of cleaning by water concentration being first in the field obtained a good start over the dry-cleaning process, but during the past few years the rate of installation of both types has been relatively the same, though on the whole wet washers have had a larger capacity.

During the year, the Royal Commission on Safety in Mines has concluded the hearing of evidence, and is at present considering its report. On the findings of this commission will be based a new act to replace the Coal Mines Regulation Act, 1911.

In addition, H. M. Government presented to Parliament in November the Coal bill, 1937. This bill is in four parts: (1) the unification of coal royalties under the ownership and control of a Coal Commission; (2) provision for the furtherance of reorganization in the industry by transferring to the new Coal Commission the functions of the Coal Mines Reorganization Commission, and by varying the powers of compulsory amalgamation given to the latter body by the Coal Mines Act, 1930; (3) extension to the end of 1942 of the duration of part I of the act of 1930, which is

## COAXIAL CABLES—COBALT

the statutory basis of the organized selling schemes, including certain amendments to strengthen the protection of the interests of consumers; (4) miscellaneous and general provisions.

In part I, it is suggested that a sum of £66.45 millions be granted as compensation to royalty owners, and that this sum be allocated by a central valuation board assisted by various regional boards. In part II the new Coal Commission is directed to endeavour to reduce the number of coal-mining leases where they think it desirable in the interests of efficiency. No compulsory amalgamations can be forced on to the industry until the Board of Trade has made an order to this effect, and the order has been laid before both Houses of Parliament in draft for 28 sitting days.

**World Production.**—Of the various grades of coal, anthracite, which is rich in carbon, low in volatile matter, and geologically of the Carboniferous period (see *Encyclopædia Britannica*, vol. 5, p. 868 *et seq.*), is of the highest "rank," but the least plentiful; while lignite, which is soft, high in ash and moisture, and geologically of the Secondary and Tertiary Eras, is generally of a low grade, but is far more abundant, the estimated coal reserves known to the world today being of the order: anthracite 500,000 million tons, bituminous 4,000,000 million tons, lignite 8,000,000 million tons.

In Great Britain, and many of the larger coal-producing countries, the coal is mainly Carboniferous, of high "rank" as determined by calorific values. On the other hand, Germany, Russia, central Europe, North America, British India, South Africa, and Victoria contain large deposits of a younger age than the Carboniferous.

The superficial extent of the coal areas of the world has been estimated at 605,000 sq.mi., or in the ratio of 1 to 110 of the land surface of the globe, about one-third belonging to formations newer than Carboniferous. Coal is found in all latitudes between Spitzbergen and the Antarctic continent, and is of better quality as a whole in the Old World than in the New, also coal of the Northern hemisphere is superior to that of the Southern.<sup>1</sup>

<sup>1</sup> Walcot Gibson, *Coal in Great Britain*.

**Germany.**—Germany, whose known coal reserves are the largest in Europe, is the world's second largest producer of coal, including lignite, and the largest producer of lignite itself. The

bituminous coal districts of Germany are mainly in the Rhine provinces; the Saar district is close to the iron-ore deposits of Germany and France, the Rhine districts are in the heart of industrial Germany, while the output of Upper Silesia, the second most important field, is used both internally and for export. The German output is of the order of 300 million tons per annum, half of which is lignite, and 20 to 25 million tons is exported to France and other European countries.

**U.S.S.R. (Russia).**—The production of coal in the Union of Soviet Socialist Republics has shown an increase unparalleled among the world's larger coal producers. The largest producing coalfield is the Donets basin of the south-eastern Ukraine, which is well equipped with railroads and readily accessible to the Black sea, and provides about 75% of the coal mined in the U.S.S.R. Both anthracite and bituminous coal are produced. An extensive lignite deposit is being developed south and west of Moscow to supply the industrial needs of that centre. One of the largest coal deposits in the world is situated in Central Siberia, the Kuznetsk basin, but it has not yet been developed to any great extent.

**France.**—France, though a large producer, is short of coal, and is therefore also a large importer. The most important coalfield is that of the Pas de Calais, centred round Valenciennes, Mons, and Lens. During the World War, 1914–18, this coalfield was occupied by the Germans, and at the end of the War they destroyed the mines. As part of the reparation payment, the mines were re-equipped and are now modernized. There are a number of other coalfields, but the coal generally is of a low rank.

**Poland.**—The main Polish coalfield borders on Silesia, and was ceded to Poland at the end of the War. The field has been extensively worked and, by reason of the Polish Corridor and State-subsidized railways, Polish coal has become a serious competitor with the older coal-exporting countries, especially in countries bordering on the Baltic.

**Japan.**—Japan is a large consumer of coal, but is none too well provided with commercial deposits. There are, however, large deposits in Manchuria, especially at Fushun, which are controlled by the South Manchurian railway and subject to Japanese influence.

**South Africa.**—There are extensive coalfields in Natal, the Transvaal, and Southern Rhodesia. The Transvaal fields are in close proximity to the Witwatersrand goldfield; in fact, some of the present gold-mines in the East Rand are situated on the site of old coal-mines. The main field at Witbank is 100 mi. from Johannesburg. The Southern Rhodesian coalfield at Wankie has co-operated very materially in developing the copper-fields of Northern Rhodesia.

**Australia.**—The more important coalfield in Australia is in New South Wales, and centres round Newcastle. A large lignite deposit is being worked in Victoria.

It will be gathered from this short review that supplies of coal are available over a wide area of the earth's surface, but it will also be noted that the most progressive countries today are those possessing ample resources of coal which are being extensively exploited. (J. A. S. R.)

**Coaxial Cables:** see ELECTRICAL ENGINEERING.

**Cobalt.** There was no great commercial importance attached to the metal cobalt until the early years of the nineteen hundreds, when extensive deposits were discovered in Ontario (Canada), which yielded a plentiful supply of a metal heretofore obtained only in small quantities as a by-product in the smelting of other metals, and stimulated the development of new uses. For a time Canada supplied most of the world's demand, but more recently even more extensive deposits have been dis-

WORLD PRODUCTION OF COAL in 1936 (1,488,000,000 metric tons), showing amounts mined in principal producing countries

covered in Northern Rhodesia, Belgian Congo and French Morocco, with the result that the Canadian output has dropped to about 20% of the total. The metal is now produced to the extent of about 2,000 metric tons annually, about half of which is used as metal, and the other half in compound form. The chief metal use is in the so-called stellite alloys, combinations of cobalt and chromium, with sometimes other metals added, and in special alloy steels, mainly for permanent magnets. The main compound utilized is the oxide, which has long been used as a blue colouring agent in the glass and ceramic industries, while smaller amounts of other compounds are used as driers in paint and varnish. (See also CHROMITE.) (G. A. Ro.)

**Coburn, Ivah Wills** (?-1937) American actress, wife of Charles D. Coburn with whom she had appeared in many productions following their marriage in 1906. She had made her Broadway debut four years previously with Julia Marlowe and E. H. Sothern in *Hamlet*. On the formation of the Coburn Shakespearean Players in 1907, she continued to enact leading Shakespearean female rôles during the next ten years. She and her husband also appeared in such Greek and French classics as *Electra* and *The Imaginary Invalid*. One of their greatest successes, *The Yellow Jacket*, was originally produced in 1916 and was revived from time to time. Their later appearances included *So This Is London* (1922-24), *The Farmer's Wife* (1924), *The Plutocrat* (1930) and *Lysistrata* (1930). In 1935 and 1936, they directed the Mohawk Dramatic Festival at Union college. Mrs. Coburn died in New York city, April 27, 1937.

**Cochin-China:** see FRENCH INDO-CHINA.

**Cocoa.** (CACAO). From a high, thirteen-cent level in New York, in Jan. 1937, world cocoa prices dropped almost continuously throughout the year to extreme lows and culminated in November in a concerted movement of Gold Coast and Togoland (West Africa) growers to withhold the remainder of the 1937-38 crop from the market until prices improved. This policy was firmly maintained through November and December and promised to extend well into 1938, with reluctance of Brazilian growers to sell reflecting a similar attitude.

As of Nov. 1, reports by the International Institute of Agriculture indicate that Gold Coast and Togoland production, which is harvested through the seven months of August to February, was as follows: Ashanti, 11,300,000lbs. marketed, 42,600,000lbs. in farmers' hands. Western Province, 2,700,000lbs. sold, 4,900,000lbs. withheld. Central Province, 8,500,000lbs. sold, 18,600,000lbs. withheld. Eastern Province, 33,600,000lbs. sold, 42,600,000lbs. in farmers' hands. Trans-Volta, 3,600,000lbs. sold, 4,300,000lbs. withheld. The 1937-38 production in Brazil was estimated by the Cacao Institute of Bahia as 2,646,000 centals. Haitian exports for the current year were 31,600 centals, compared to 36,200 the previous season. No comprehensive figures are available for Nigeria, Surinam and Trinidad.

(S. O. R.)

**Coco-Nuts.** The world's coco-nut industry, which centres mainly in an annual production of about 1,000,000 tons of exportable coco-nut oil, was materially affected by a Supreme Court decision and three crop developments in 1937, all in the United States. On May 2 the U.S. Supreme Court handed down a unanimous decision upholding the constitutionality of the Revenue Act of 1934 in which an excise tax of three cents a pound was imposed on the first domestic processing of coco-nut oil from the Philippine Islands. The act was attacked in court

A COFFEE NURSERY where a selection is made of the healthiest plants

by two U.S. soap companies which contended that it was similar to the Agricultural Adjustment Administration's processing taxes, which the court had declared unconstitutional. The court ruled that Congress had authority to levy the tax for revenue and with the collateral purpose of protecting certain industries in the country. The decision recited that the Philippines were in a sense wards of the United States, although having been granted conditional independence, and that Congress had a right to enact the law, which might be burdensome to the Philippines and then provide that the amount of the revenue so collected should be paid to the Philippine treasury in recognition of a national duty not to impose a burdensome tariff that might injure the Philippines.

The 1937 bumper corn crop in the U.S. also affected the coco-nut oil industry throughout the tropics because it meant abundant feed for hogs and, therefore, a larger production of lard, which competes with coco-nut oil in the composition of oleomargarine, cooking fats and other edible compounds. The number of hogs in the U.S. increased from 42,948,000 in 1936 to 44,418,000 in 1937. In addition the record U.S. cotton crop of 1937 provided further competition against imports of coco-nut oil in that cottonseed oil is used also in the manufacture of oleomargarine, cooking fats and other edible compounds and also competes in the manufacture of soap.

Coco-nut oil is such an important product in international trade that it is shipped from the Philippines to the United States in tank steamers, although from many producing countries it is exported in the more expensive manner, in drums and barrels. It is one of the leading four of some 20 vegetable oils and three animal fats used somewhat interchangeably throughout the world as food, in the manufacture of soap and as drying agents in paints. (See VEGETABLE OILS AND ANIMAL FATS.) The average annual production of exportable coco-nut oil was placed at about 940,450 tons by Dr. Reginald Child, director of the Ceylon Coco-nut Research Scheme, in an address to Ceylon coco-nut growers in October, 1937. Dr. Child placed the average annual exportable production of other oils that compete with coco-nut oil at approximately: cottonseed oil, 1,044,000 tons; groundnut oil, 1,010,000 tons; olive oil, 800,000 tons; linseed oil, 750,000 tons; soybean oil, 618,000 tons; sunflower seed oil, 375,000 tons; palm oil, 330,000 tons; palm kernel oil, 231,000 tons; rapeseed oil, 280,000 tons; tung oil, 65,000 tons; maize (corn) oil, 35,000 tons; castor bean oil, 58,800 tons; hempseed oil, 10,500 tons; other vegetable oils, 60,000 tons; a total annual production of 5,788,500 tons of vegetable oils. The animal fats, excluding butter, that compete with coco-nut and other vegetable oils are lard,

tallow and whale oil. Average annual exportable production was placed at about 400,000 tons each for lard and whale oil and 320,000 tons for tallow.

(S. O. R.)

**Codeball**, which had its beginning in the U.S. eight years ago under the jurisdiction of the Amateur Athletic Union, now occupies a conspicuous place among sports in every section of the country. This combination game of golf and soccer is played indoors and out by many thousands of enthusiasts in gymnasiums, schools, camps, parks, playgrounds, hospitals, and private homes.

The chief event last year in codeball on the court was its fifth national A.A.U. championship, held in Chicago, where eighty top-notch players took part. George Webster, of Chicago, won the championship by defeating Al Topp, Jr.; C. A. Sippel, third, and Russel Larsen, fourth.

Codeball on the green, the outdoor version of the game, held its national A.A.U. championship tourney in Forest park, St. Louis, Mo. The men's championship was won by Lou Murphy with a score of 58, equalling the course record made in 1936. Martin Dooling was runner-up; Jim Cowhey, third. The title in the women's division was won by Miss Erville Droll; Miss Edne Gustavson, second, and Miss Marie Bean, third. William E. Code, M.D., the originator of the game, is chairman of the national codeball committee of the A.A.U.

(J. B. P.)

**Coffee.** Overproduction continued during 1937, as in most of the previous 30 years, to be the great problem of coffee growers. On July 1 there was a carry-over estimated at 30,451,000 bags of 132lbs. to the bag. Of this 28,069,000 bags were Brazilian coffee and 2,382,000 were from other countries, a total only slightly less than the peak world carry-over of 1932. This supply, together with the current crop of 25,462,000 bags in Brazil and 11,500,000 in other countries, gave a total world supply for 1938 estimated at 67,413,000 bags, of which 53,531,000 bags were Brazilian and 13,882,000 the product of other countries. In the last five years world consumption of coffee has averaged about 24,100,000 bags a year.

In August Latin-American coffee-growing countries joined in a conference in Havana, Cuba, seeking ways to regulate production and distribution, but no agreement was reached. In May the Brazilian government's "coffee defence," or "coffee valorization"

COFFEE PICKERS at work

measures provided that 30% of the 1937-38 crop should be bought by the government at 29 cents a bag and destroyed. The government issued 500,000 contos (\$28,632,000) to finance this procedure. It was also decreed that 30% of the crop should be exported and the remaining 40% purchased by the government at \$3.72 a bag and stored to keep it off the immediate market.

In November President Vargas reduced Brazil's export tax on coffee from \$2.58 to 69¢ a bag, and the state of São Paulo reduced its transportation tax on coffee from 42 to 24 cents a bag. These measures were part of a procedure designed to maintain home prices as well as assist in foreign marketing. Since the first governmental activities in "coffee defence" in 1906 Brazil has financed these efforts in different ways, by export taxes, borrowing and issuing currency. These activities through about 30 years constitute the longest period of a government's activities in regulating the marketing of a major agricultural product.

Between 1931 and July 1, 1937, Brazil destroyed 47,961,000 bags of coffee, chiefly the lower grades. Most of this was piled in heaps and burned. Other quantities were dumped in the sea and some effort has been made to convert coffee into fuel for industrial and power plants by mixing it with tar and pressing it into bricks.

For half a century Brazil has produced more than half the world's coffee and since 1900 has averaged about 72%. In four of the last nine years the Brazilian crop has been larger than the entire world's annual consumption of coffee. (See also BRAZIL: History; GUATEMALA.)

(S. O. R.)

DRYING THE COFFEE

## Coffin, Howard Earle

(1873-1937), American industrialist, was born near West Milton, Ohio, Sept. 6, 1873. Early interested in the development of the automobile, he headed the experimental department of the Olds

Motor Works in 1902 and joined in founding the Hudson Motor Car Company in 1909. A champion of standardized production, he was called by President Wilson to head the Committee on Industrial Relations in 1916. Following his appointment to the Aircraft Production Board during the next year, he devoted his time to organizing the aircraft industry. In recent years, he interested himself in developing Southern textile manufacture. His death occurred at Cabin Bluff, Ga., Nov. 21, 1937, as the result of a hunting accident.

**Coke.** The production of coke centres in the more heavily industrialized countries, particularly those with a large pig iron output. World production dropped from 144,500,000 metric tons in 1929 to a low of 79,500,000 tons in 1932, recovering to 116,000,000 tons in 1935, the last year for which complete data are available, and to an estimated 141,000,000 tons in 1936. In 1935 the distribution was: United States 28%; Germany 25%; Soviet Union 14%; United Kingdom 10%; France 6%; Belgium 4%; Netherlands 2%; India, Canada, Czechoslovakia and Poland 6%; leaving 5% for various minor producers. Increases in production in 1937 were heaviest in the United States, Germany, the Soviet Union and the United Kingdom. Although the German pig iron production is less than half that of the United States, its coke output, including that of the Saar, is almost as great; part of this difference is explained by heavy German exports of coke, which amount to about 20% of the output. British exports also take about 20% of the local production.

The United States produced 54,325,000 metric tons in 1929, and 19,766,000 tons in 1932, a drop of 64%, as compared with a drop of only 34% in foreign production; in 1936 production had recovered to 41,980,000 tons, or 75% of the former high, against a recovery to 10% greater than the 1929 high for foreign production. Exports of coke from the United States are small, and outside of shipments of 1-3% of the total to Canada, are negligible in amount; imports average less than 1%. Almost the entire output is made in by-product coking ovens, only  $\frac{3}{4}$ % now being made in beehive ovens, against 11% in 1929, and 40% as late as 1920. Of the 1936 total, 70% was used in iron furnaces, 22% as domestic fuel, 4% in foundries, and 4% in other industrial uses.

(G. A. Ro.)

**Cold, Common.** Kerr selected individuals free from but known to have frequent attacks of the common cold and exposed them to patients in the acute stages. Of a total of nineteen subjects exposed in five groups, not one positive result was obtained. This observation suggests that some colds are not so readily transmitted as is often asserted. Observations by Charlton suggested that people are greatly influenced by climate in their ability to resist infections of the upper respiratory system. Thus persons working in laundries with high temperature and moist heat seem relatively resistant. Furthermore, the individual sufferer from colds between October and April has an altered vasomotor reaction of the upper respiratory mucosa to thermal stimuli applied to the skin. Allergy has been discussed as a causative factor and the virus etiology of some colds has received further study.

The attempted prevention of colds has been concentrated particularly on the alleged effectiveness of vaccines. Rockwell and Van Kirk have continued their studies on the relation of heterophile immunity and the incidence of colds, especially as applied to administration by mouth. The results of administration in this manner have been, they believe, successful in reducing both the incidence and the period of invalidity. Toomey among others, however, has seriously questioned the value of attempted immunization either by this means or by the perhaps more commonly

employed injection method. A five-year study of the value of cod liver oil in reducing industrial absenteeism caused by colds and respiratory diseases concluded that the cod liver oil groups were absent materially less time than the control groups. This view has not, however, been generally accepted.

Rest in bed, according to LeBlanc and Welborn, instituted with relative promptness, seemed to have some effect in reducing the incidence of complications from colds in nurses. There was a difference in favour of this group as compared to another group for whom rest in bed was delayed, in days off duty, days in the hospital and length of illness. Complications were more than five times as frequent in the delayed group as in the other. Inhalations of sulphur dioxide gas were found useful during the early stages of an infection. Deep inhalations however are not necessary and tend to make the patient cough. In a group of patients treated with ephedrine sulphate and amytal orally early in the course of a common cold, improvement was noted in 83% as compared to 26% of the control group receiving capsules of milk sugar. General discussions of the management of the common colds also have been published.

**Colijn, Hendrick** (1869— ), Dutch statesman, born at Haarlemmer Meer, took up politics as a member of the Anti-Revolutionary (Catholic and Conservative) party in 1909, becoming its leader in 1922. From 1925 to 1926 he was premier, and has held that office continuously since 1933. On Jan. 11, 1937, Dr. Colijn appealed for close co-operation between the democratic States in the interests of world peace and economic stability, suggesting that the Oslo Powers should confer on measures for increasing mutual trade; and such a conference was held at The Hague in March. At the end of February, explaining Holland's defence plans, he stated that she "must be able to defend herself so as to make her worthy of the help of others." In April, he attended the International Sugar Conference in London, returning to Holland to prepare for the general election of May 26, in which, supported by the Liberals against the growing Dutch National Socialist party, he secured a great electoral success, his own party increasing its vote by some 40%. On June 23, he formed his fourth cabinet, from his own party, the Christian Historical party and the Catholics, no Liberals accepting office. After the election he had stated: "Our people have called a halt to Nazism. . . . I am in favour of a strong State authority, but with due respect for the people's freedom."

**Colombia**, a republic in northern South America bordering the Pacific and the Caribbean; language, Spanish; capital, Bogotá; president, Alfonso López; area, 440,846 square miles. Population, third largest in South America, 7,851,000 (1928 census); (estimated, 1935) 8,580,000. The leading cities are: Bogotá, 222,467; Barranquilla, 180,000; Medellín, 140,000.

**History.**—Colombia is one of the most rapidly advancing countries of Hispanic America. During 1937 the progressive trend which had marked the administration of President López in previous years was continued, with educational improvement and the furthering of social legislation. Political developments centred largely around a struggle between the left and right wings of the dominant Liberal Party for control of the party organization and through it the nomination of a successor to President López, whose term expires in 1938. The minority Conservative Party

continued its policy of abstention from voting. Despite exaggerated political activity there was no hint of any revolutionary movement or political *coup d'état* which would mar Colombia's proud record of no revolutions in over a quarter century, longer than that of any other Hispanic-American republic.

On Feb. 2, the senate approved 36 articles of amendment to the constitution, and referred them to the house of representatives. Among these were provisions for the creation of a federal district, and others designed to strengthen the powers of congress. The congressional campaign, on whose results control of the Liberal Party hinged, was disorderly. The election itself, on Apr. 6, gave the right-wing liberals, led by Eduardo Santos, a decided majority in the house of representatives. The Conservatives entered no candidates.

In May the congressional session was extended three weeks to allow for deliberation on several administration measures, including obligatory workmen's insurance, Government participation in the banana industry, and peso devaluation. The first was enacted into law, but the last two faced such determined congressional opposition and hostility that President López, on May 25, formally tendered his resignation, and, charging undue political influence of moneyed interests, attacked Santos as a reactionary. Acceptance of the resignation was, however, refused by the senate, and a vote of confidence given the president.

In July the Liberal Party convention, with a majority of its personnel members of congress, met and nominated Santos for the presidency. In accepting, Santos declared for revision of the Colombian concordat with the Holy See and for semi-annual congressional sessions, and against labour unionism. The conservatives put up no official candidate. Late in the year an acrimonious dispute between the church and the Government came to a head, with the archbishop of Bogotá protesting against the scientific teaching fostered by the ministry of education.

Colombia's financial and economic state showed considerable improvement during 1937. As a result efforts were made to arrange resumption of payments on dollar bonds in default since 1930. The condition of the world coffee market at the close of the year, however, left a note of uncertainty, due to the changes in Brazilian coffee policy.

**Trade and Communication.**—Colombia has external communication by sea through Barranquilla and other ports, with a well-developed air transport service. There are 1,400 mi. of railways and some 5,000 of highways, with a program of highway extension under way. In 1936 imports (largely textiles and other manufactured goods) were 120,036,874 pesos from the United States (41%), Germany (22.4%), Great Britain (18.8%); exports were 136,844,451 pesos (not including 20,787,792 pesos of gold), to the United States (54.3%), Germany (16.6%), and Curaçao (11%). Coffee constituted 67.3% of the total exports; petroleum, 10.6%; bananas, 6%.

**Agriculture, Manufactures, Mineral Production.**—In addition to the principal export crops, coffee and bananas, Colombia produces sugar, wheat, rice, cotton, cacao, and tobacco, chiefly for domestic consumption. The pastoral industry annually produces some 3,000,000 pesos value of hides for export. Mineral resources are extensive, Colombia ranking ninth in the world production of petroleum, second in platinum, and first in emeralds. Gold production is heavy. Valuable but undeveloped copper and coal deposits are available. Enormous undeveloped timber resources exist. Manufacturing for domestic consumption has advanced 50 to 80% since the protective tariff was imposed in 1931, with 300,000 skilled and unskilled labourers employed in producing ice, sugar, cement, tobacco, flour, and other commodities.

**Banking and Finance.**—The monetary unit is the peso (value:

56¢ U.S.). In 1936 revenues were 74,186,038.25 pesos, and expenditures 68,337,870.85 pesos. The national budget for 1937 was \$40,758,451.

**Education.**—In 1936 there were 8,459 primary schools (enrolment, 553,706), largely supported by the National Government, and 438 secondary schools (enrolment, 31,122), about 80% privately owned, although aided financially by the Government. The national budget allotted 8.5% to education. The Government policy was for increasingly close Government supervision of all schools and a gradual improvement of educational conditions. In Jan. 1937 a system of seniority and minimum pay for teachers was inaugurated. There were universities at Bogotá and Medellín.

(L. W. BE.)

**Colorado,** a Rocky Mountain State of the United States, popularly known as the "Centennial State," admitted to the Union 1876; area 103,658 sq.mi., one-third occupied by mountains; population (1930) 1,035,791 and estimated, July

TELLER AMMONS, governor of Colorado

1, 1937, at 1,071,000; equally divided between urban and rural; 961,117 whites, 57,676 Mexicans, 11,828 Negroes, 1,395 Indians, other races 3,775; native-born whites 875,711, foreign-born whites 85,406. Capital and largest city, Denver, 287,861.

**History.**—Teller Ammons, Governor; Bryon Rogers, Attorney General; Frank J. Hayes, Lieutenant - Governor; George E. Saunders, Sec-

retary of State; Thomas J. Annear, State Auditor; Homer F. Bedford, State Treasurer.

The year 1937 was marked by three outstanding public enterprises. First, the State made the sum of \$25,000,000 available immediately for highway development. This speeding up on an ambitious program of road building, which has been carried on for years in co-operation with the Federal Government, will serve to bring together communities in the State which are now separated by mountain barriers, and also to accommodate the great number of tourists who flock to Colorado especially in the summer months.

The second enterprise was the most generous provision for impecunious old people which has ever been made in any country. In Nov. 1936, there was incorporated in the State Constitution by popular vote an amendment under which a minimum pension of forty-five dollars a month is made mandatory for each needy citizen who reaches the age of sixty. This provision, which has already plunged the State into a financial crisis, presents some very interesting questions. Will the State be able to afford it? Is the provision not so generous that many will take deliberate measures to qualify as indigents at the age of sixty? And will not Colorado become the happy hunting ground of people from other States? A fifteen year's residence is required, but what are fifteen years if by somehow keeping the wolf from the door for that length of time people can make sure that after sixty there will be no wolf at all?

The last development to be noted is a great engineering enterprise. In the closing days of 1937, President Roosevelt approved an Act of Congress appropriating the sum of \$900,000 for beginning a project which involves the impounding of the more

abundant waters of the Western Slope (the Continental Divide bestrides the State in a north and south direction) in vast reservoirs in the region of Grand Lake, and the bringing of this water through a 13-mile tunnel through the Continental Divide to irrigate some 700,000 ac. of the plains of northern Colorado. Incidentally the enterprise will be a power project also. It is estimated that the cost of the whole project will be in the neighbourhood of \$44,000,000.

**Education.**—State schools are: University of Colorado, State college of agriculture and mechanic arts, State school of mines, State college of education, Western State college, Adams State Normal school, School for the deaf and blind, Fort Lewis school, Industrial school for boys, Industrial school for girls. Private institutions are: University of Denver, Colorado college, Regis college, Colorado Woman's college.

**Charitable and Penal Institutions.**—State hospital for the insane, two homes and training schools for mental defectives, Soldiers and Sailors home, Industrial workshop for the blind, Colorado General hospital, State Psychopathic hospital, State penitentiary, and State reformatory.

**Agriculture, Manufacture and Mining.**—Farm products, \$187,298,846; manufactures, \$135,868,377; tourist business, \$50,000,000; mining (mineral and coal), \$39,496,095; 161 banks with total assets of \$323,252,263. (G. No.)

**Columbia, District of:** see WASHINGTON, D.C.

**Columbia University,** in New York city, had in 1937–38 a registration of 32,245 resident students, including 11,809 in the summer session of 1937. The total number of officers of instruction and administration was 3,413. There were 69 university buildings on Morningside Heights. In 1937 the university capital endowment was \$86,688,931 and the total resources were \$154,669,109. The budget appropriation for 1936–37 was \$11,120,344. Tuition fees range from \$390 to \$500. Its main library, containing 1,563,100 volumes, is housed in a new building, the gift of Edward S. Harkness, and known at present as South Hall, opened in 1934. The rare book department and a number of special collections remain in the former library, now known as Low Memorial Library. The department of home study courses and Seth Low junior college in Brooklyn have been discontinued. Teachers college has introduced the school of advanced education leading to the degree of Doctor of Education, and New college, for the training of teachers. A new foreign language centre, the Casa de las Españas, was opened in 1934.

(N. M. B.)

**Columbium.** From little more than a laboratory and museum curiosity, columbium has within five years become a regular commercial product, with an output of some 500–600 tons of concentrates yearly, most of which comes from Nigeria. Occurring chiefly as a discarded impurity in certain tin ores, the tailings piles are now being reworked for their columbium content, which is raised to 45–55% by ore dressing. After importation into the United States, the concentrates are subjected to still further cleaning and purification, and are then treated in an electric furnace for the production of a ferro-alloy containing 50–60% Cb. The original application which led to the commercialization of the metal was its addition to stainless steels for high temperature work, for the prevention of intergranular corrosion. Another important development is a columbium-treated welding

## COLOUR PHOTOGRAPHY—C. I. O.

rod, which makes a weld that does not require heat treatment to develop its maximum strength. (G. A. Ro.)

**Committee for Industrial Organization,** a federation of labour unions in the United States and Canada, is headed by John L. Lewis, president of the United Mine Workers of America.

The C.I.O. was formed on Nov. 9, 1935, by representatives of eight international unions affiliated with the American Federation of Labor to promote the development of industrial unions within the American Federation of Labor. They announced their purpose to encourage and promote organization of workers in the mass-production and unorganized industries of the nation.

The American Federation of Labor was organized in 1881 and developed as a federation of craft unions. Unwilling to yield any of their membership or potential membership to industrial unions, the American Federation of Labor craft union leaders on Sept. 5, 1936, found the unions backing the C.I.O. guilty of "insurrection" and suspended them from the American Federation of Labor. The C.I.O. has developed as an independent labour movement rival since that time. On its second birthday the C.I.O. reported a total membership of approximately 4,000,000 in 32 national and international unions and 600 directly affiliated local unions.

The first objective of the C.I.O. was to organize the employees in the mass-production industries, such as steel, automobiles and rubber, into industrial unions. It took over three weak American Federation of Labor unions in those fields and started an intensive organization campaign in the autumn of 1936. Twelve months later the C.I.O. reported the membership of the Amalgamated Association of Iron, Steel and Tin Workers had grown from approximately 10,000 to more than 500,000; the United Auto-

"THE CLOSED SPACE AT THE CONFERENCE TABLE." Contentious efforts to settle A.F. of L. and C.I.O. differences leave no room for the interests of labour, so Cartoonist Russell represents in the *Los Angeles Times*

HE WHO HOLDS THE AXE saves his own neck. The struggle for power between President William Green of the A.F. of L. and John L. Lewis, head of the C.I.O., as pictured by Elderman in the *Washington Post*

bile Workers from 30,000 to 375,000, and the United Rubber Workers from 25,000 to 75,000. The automobile campaign was attended by several large scale "sit-down" strikes, the first of that type to attract nationwide attention in the United States and Canada. Although the press and public generally condemned these strikes as lawless and a seizure of private property, they won for the automobile workers union the first written labour agreements which two of the largest motor makers in the country ever had granted. In steel, the C.I.O.'s outstanding victory was a written agreement with the United States Steel Corporation, the world's largest steel manufacturer. Along with its economic activity the C.I.O. entered the political field, organizing Labor's Non-Partisan League and the American Labor Party as political adjuncts.

Throughout its earlier development the C.I.O. was financed by contributions from its stronger and wealthier member unions. In the summer of 1937 it levied a per capita tax of five cents a month on each member of its affiliated unions. **Communism.** Communism is now generally understood to be that form of Marxianism, resting on revolution and the dictatorship of the proletariat, which triumphed in Russia after the Bolshevik revolution in the autumn of 1917, and has since been gradually developed in the course of the last 20 years. In that sense Communism represents revolutionary Socialism, hostile to the slow process of gradual reform and progressive

compromise; and it stands in contrast to the "reformist" Socialism which makes its peace with parliamentary institutions and is willing to proceed by successive stages of change. In another sense, and from another point of view, a distinction has lately been drawn by Stalin and his followers between Communism and Socialism. In this sense, and from this point of view, Communism is not an advanced and revolutionary form of Socialism. It is the ultimate goal, not yet reached in Russia, which can only be attained after a previous and experimental phase of Socialism, which Russia is now supposed to be traversing. On this basis, a Socialist society, such as now exists in Russia, is one in which all are necessarily workers, but each receives a different reward for his work, according to the amount which he has done. A Communist society, which has still to be instituted in the future, will be one in which all work, and each will receive a reward for his work proportionate to his needs. The use of general political terms is often fluctuating; but it seems permissible, in spite of Stalin's recent refinement, to apply the term Communism to the system of society and government which now exists in Russia, and which has recently been clarified and defined in the new Russian constitution adopted in 1936.

We may therefore say that Communism means a system of society and government, achieved by the overthrow of landlordism and capitalism and by the institution of the dictatorship of the proletariat (which primarily consists of the urban artisans), such that the economic basis is a Socialist system of economy and Socialist ownership of the means of production, and such, again, that the political basis is the toilers of towns and villages represented by and acting through their deputies. This, at any rate, is the theory. In practice, the Communist State—similar in this respect to the Fascist—finds its political basis in a single party (a party with nearly three millions of adherents), which manipulates social and political institutions, and which itself is manipulated by its own central bureau and the secretary of that bureau.

On the economic side, as it stands at present, Russia is by no means pledged to an absolute and unqualified system of State-ownership. In effect, its economy is what may be called a mixed economy. That is, a large measure of State-ownership (both of land and of factories); here is a considerable amount of co-operative or collective-ownership (both in respect of agriculture and in respect of industry) by voluntary groups or associations; and alongside this Socialist system of economy, in which the State or the association is the owner, there is also what is called the "small private economy" of individual peasants and craftsmen, based on their own individual stock and labour. Under this mixed economy there is a large and developed system of trade unionism among producers, and another and developed system of co-operative societies among consumers. The State is not all in all: it admits by its side (if under the tutelage of the Communist party, to which it is also subject itself) a trade union and a co-operative movement. Under the same system of a mixed economy there is also, as already said, a considerable divergence of incomes: the workers are largely paid by piece-work rates, and managerial and administrative posts carry higher salaries. The divergence of Russia from so-called capitalistic States may be easily exaggerated. On the other hand, it must be said that in one respect the State goes farther in Russia than in other countries. It furnishes a larger amount of what may be called collective amenities (free education, health-service, holiday facilities, provision for amusement) which are enjoyed equally by all alike. The equality of this enjoyment may be set over against inequality of remuneration.

On the political side Russia seems to have changed greatly (at any rate in form) during recent years. The ultimate power still resides in the Communist party and its bureau. But that is less of the rule of arbitrary discretion (or "revolutionary legality")

and more of an attempt to institute the rule of law. The new constitution of 1936 is an attempt to bring Russia—again it must be said “at any rate in form”—into line with the principles and practice of parliamentary democracy. A directly elected parliament (or “supreme council”), and a removal of disfranchisement, are part of this attempt.

In another respect, too, Russia seems to have changed. Twenty years ago Russian Communism sought to capture the world. It recognized no territorial limits: its theory was one of the subversion of all States and the institution of a single universal workers' republic.

Today Russia is apparently a territorial State, with a national basis. But that is a sense in which, the more it changes, the more Russia remains the same. There is still the old tsarism, if now it is semi-veiled dictatorship; and there are still cleansings and purges and proscriptions.

On Russian Communism the great work is the Webb's book on *Soviet Communism*. The second edition contains, in an appendix to the first volume, a translation of the text of the new Russian constitution. Levin's pamphlet on *The State and Revolution*, published in 1917, contains a statement of the principles and organization of Communism which still deserves to be read.

(E. B.)

## Communist Party.

The world organization of Marxist Socialists operates through branch national parties very loosely affiliated to the Communist International or “Comintern.” In 1936 an “Anti-Communist Pact” was formed by Germany and Japan, and in Nov. 1937 this was joined by Italy.

In 1937, the party in Russia underwent an extensive purge, resulting in the disappearance of such noted figures as Bukharin and Rykov; in March, a reform of the Party constitution and a democratization of its organization, with secret ballot voting on Party questions, was announced.

At its annual conference at Montreuil in January, the membership of the French Communist party was given as over 280,000; M. Thorez, the leader, reaffirmed the party's loyalty to the *Front Populaire*, and general support of the Blum and Chautemps governments continued throughout the year, though the Communists did not enter the Government.

In August 1937 the Communist party in the United States had approximately 50,000 members with 15,000 others enrolled in Young Communist Leagues; and in November 20,000 people packed Madison Square Garden in New York city to see 3,000 more take their pledge. Investigation of expenditures in the 1936 presidential election revealed that the party had spent more than all other minor parties combined (\$270,489 from all party sources) in securing a tally of 80,159 votes. The main developments of the year were the United States Supreme Court reversal of an Oregon decision condemning Dirk de Jonge for organizing an admittedly peaceful Communist meeting, party support of C.I.O. strikes, court confirmation of a decision ruling the party from New York State ballots for failure to poll 50,000 votes in the 1936 gubernatorial election, and initiation of a campaign for support of party newspapers in Chicago and San Francisco.

In Great Britain the only noteworthy electoral success in 1937 was the return in November of the first Communist member to a London Borough Council in the Spitalfields East ward of Stepney. Attempts to form a “United Front” with the Labour Party were pursued, as the result of a resolution of the Party Conference in January; and at elections the party generally continued to support official Labour candidates, frequently causing embarrassment to the latter thereby; but the Labour party in conference in May

renewed their decision not to permit Communist affiliation, and the disbandment in June of Sir Stafford Cripps's Socialist League marked the effective end of the United Front. The Party membership, though some increase took place, did not exceed 10,000.

## Community Chests.

The method of raising funds for the support of charitable and philanthropic agencies through one annual appeal on a community-wide basis is usually referred to as the community chest. Closely allied with it is the central planning group generally known as the council of social agencies. In 1938 the 25th anniversary of the modern community chest movement will be observed. It was in 1913 that Cleveland, Ohio, formed a Federation for Charity and Philanthropy, which raised money for its constituent organizations, and inaugurated the system, now considered essential to a chest, of budgeting to determine their actual needs and resources.

There are 465 communities which finance private social services through contributions to community chests or community funds. Of these, 453 are in the United States, including two in Hawaii, nine in Canada, two in South Africa, and one in Cuba. The areas covered by these chests include a total population of 49,881,361. About 9,000,000 persons make their annual contribution to community service through this medium.

Chests in 1936, for use in 1937, show a total of \$81,611,695. Results from 311 campaigns in the fall of 1937 showed a total of \$61,000,000, with a 3% rate of increase which was expected to bring the year's total of contributions for 1938, including the additional 155 chests making later reports, to fully \$83,000,000.

Affected less by the depression than were other types of contributions, chest resources at their lowest in 1935 had dropped to 84% of their pre-depression level. Since then they have steadily increased, as shown by a study of comparable chests, until the level of giving for 1938 was 93% of that for 1929.

To give backing to local campaigns and to stimulate greater participation by citizens, the Community Mobilization for Human Needs was first organized in 1932. Thirty-six national social agencies co-operate with it, and Community Chests & Councils, Inc., is its administrative agency. For 1937-38 Charles P. Taft, of Cincinnati, was chairman, and the National Citizens' Committee comprised a representative group of 150 men and women.

A swing in emphasis from efficient money-raising to efficient money-spending has accompanied the growing stability of financial campaigns. The quality of the social services financed by the chest has appeared more and more a necessary concern of the chest and the council of social agencies. Surveys and studies, several under the direction of the national office of Community Chests & Councils, have been carried on in numerous cities to determine the best possible use of funds to meet changing community needs.

The recent enlargement of governmental responsibility and resources in social welfare has led to increased interplay between official and voluntary social agencies.

Officers of Community Chests and Councils, Inc., for 1937-38: Honorary president, Newton D. Baker (died Dec. 25, 1937); president, Stillman F. Westbrook; vice-presidents, John Stewart Bryan, Geoffrey S. Smith, Dr. George E. Vincent; executive vice-president, Allen T. Burns; treasurer, Hendon Chubb; secretary, Percival Dodge. Address: 155 East 44th Street, New York.

(A. T. B.)

**Community Trusts.** Charitable trust funds approximating \$46,500,000 (£9,300,000) have been accumulated in 78 community trusts, founded since 1914, chiefly in the United States. These trusts or foundations are, ordinarily,

composite charitable administrative agencies comprised of numerous funds from diverse sources and for varied purposes, with several fiduciary institutions supplying fiscal management to the funds in their custody and with a central distributing committee supervising appropriations. Usually a portion, and frequently a majority, of the distributing committee is appointed by the incumbents of positions of public trust, such as the head of the Association of the Bar, the Academy of Medicine, or federal judicial officials.

Each community foundation is a framework within which numerous charitable funds may be administered. Its principal distinguishing characteristic—subject to local variations—lies in the circumstance that, though the distributing committee will undertake to give expression to the desires of a founder concerning the specific application of a fund established by him, discretionary power is vested in the committee to amend and adapt such originally expressed desire if unforeseen changes in conditions make its literal execution impossible or impracticable. By this device the rigidity of permanent charitable funds is avoided and the curative powers of the courts over obsolete trusts is amplified.

The resources of these trusts have trebled during the past ten years. The New York Community Trust, with resources of \$8,764,712 (£1,752,942) is the largest, followed by those in Chicago, Cleveland, Boston, and Winnipeg. Of the 78 existing trusts, 59 are now in possession of principal funds and 41 are making periodical distributions currently aggregating \$1,100,000 (£220,000) annually. While their rate of growth has been affected by the economic depression following 1929 and by the increased financing of relief in the U.S. Government, it is nevertheless probable that the provisions of numerous wills, executed but not yet effective, will continue to expand the resources of these newly developed media of philanthropic administration. (R. Hs.)

**Concrete:** see ARCHITECTURE: *Materials*.

**Confectionery.** Flippantly described only a few decades ago as the "lollipop" trade, the chocolate and confectionery industry has reached considerable proportions, not only in Great Britain and the United States of America, but also in many of the British Dominions. The industry covers chocolate and a wide variety of cocoa preparations, whilst sugar confectionery (candy) covers a wide range of goods, from hard lozenges to toffee and chewing gum. Sugar confectionery is quite separate from flour confectionery, which is the product of the baker.

The most striking development recently has been in the direction of the improved packing of the goods, most of the sweets now being wrapped individually and presented in boxes, bottles, or other packs. On the mechanical side great progress has been made during the last year or two in wrapping machinery, particularly in the direction of greater outputs per machine and per person employed.

The principal countries of manufacture are the United States, Great Britain, Switzerland, France, Germany, and the larger British Dominions. The consumption per head is greatest in Great Britain, where the output on a retail basis is valued at over \$250,000,000 per annum. The fifth census of production (1935) showed a value of the output of the factories as \$181,610,000. In the United States the output in 1936 for 146 manufacturers (according to the foodstuffs division of the Department of Commerce) was \$125,881,230.

Over one million people are employed in the manufacture and distribution of chocolate and confectionery, the ingredients of which come from every quarter of the world. Numerous other industries, such as machinery manufacturers, producers of essences and essential oils, glucose (maize syrup), and box manu-

facturers find in the chocolate and confectionery industry a wide outlet for their goods. (A. E. Wt.)

**Confucianism,** the term applied to the ethical teachings and rites associated with the name of the famous Chinese sage Confucius (traditional dates, 551–479 B.C.). Confucianism is a system of morality rather than a religion, in the ordinary sense of the term. It emphasizes five "cardinal relationships," between ruler and subject, between father and son, between husband and wife, between brothers and between friends. Confucius, like other philosophers of the Chou Period to which he belongs, is primarily concerned with the salvation of society through the development of ideal human relations. The general tenor of his teaching is conservative and he enjoins the duties of obedience owed by subjects to rulers, by children to parents, by wives to husbands. At the same time he emphasizes the obligations of the ruler and of the governing classes generally and points out that society is best kept at peace not by force, but by the influence of high character on the part of the emperor and his subordinates. His fundamental rule of morality was: "What you do not wish done to yourself, do not do to another." The five major Confucian virtues are filial piety, love, wisdom, reverence, and sincerity. Although Confucianism underwent some vicissitudes of court favour and was modified by the impact of Buddhism, it acquired the status of a Chinese State religion and has exercised a profound influence on Chinese national thought and social development.

Of the estimated 350,600,000 Confucianists, 350,000,000 are residents of Asia (almost all of China), the remainder of North America. (W. H. Ch.)

**Congo, Belgian:** see BELGIAN CONGO.

**Congregational Church.** During the past year, this denomination's numerical strength in the United States was increased to a total of 1,030,029. Additions to its membership for the year 1936 were 55,659, registering a net gain of 1,991. The number of churches throughout the United States numbered 6,153 on Jan. 1, 1937. During the year 1937, the denomination proceeded further in the unifying of its organized boards, bringing together in one Board of Home Missions all of the societies dealing with home missions, education, ministerial relief, Negro education and publishing. The American Board of Commissioners for Foreign Missions, the foreign board of the denomination, continues as a separate unit. These boards received during the year 1936 a total of \$2,114,954, of which more than three-fourths was from living givers, the balance being derived from endowments and legacies. The American board, operating under other flags, has had its special problems in the Far East. Its missionaries in China have continued their work with slight interruption, only one school having been closed as a result of the war with Japan. Its missionaries in Japan also have continued to work, although faced with the growing nationalism of Japan which threatens an end to all foreign influences. The biennial General Council of the denomination will be held at Beloit, Wisconsin in June 1938. The denominational headquarters are at 287 Fourth avenue, New York. Dr. Charles E. Burton is the general secretary. (H. C. He.)

**Great Britain.**—In the year 1937 the Congregational Union of England and Wales possessed a membership of 424,774, showing a decrease of 7,589 on the total for 1936. There are 4,465 places of worship (including 1,017 in the Union of Welsh Independents); Sunday school pupils total 395,060, being 23,996 fewer than in the previous year.

The Congregational Union of Scotland has 175 places of worship

and a membership of 40,546; the Congregational Union of Ireland 78 and 2,170 respectively. International Congregationalism has 69,066 members in Africa; 21,611 in Australia and New Zealand; 30,580 in China and 48,582 in India and Ceylon.

During 1937, in England and Wales, six new churches have been opened and 11 new churches are in course of building or contemplated.

The 105th Assembly of the Union was held in London in May when the Rev. E. J. Price, principal of the Yorkshire United Independent college, Bradford, occupied the chair. As chairman of the Union of England and Wales Mr. Price was present at the coronation ceremony in Westminster Abbey.

The chairman's address dealt with the subject "The Churches, the Ministry and the Colleges." Special tribute was paid to Dr. J. D. Jones, who was then about to retire from the ministry of Richmond Hill church, Bournemouth, after a pastorate of nearly 40 years. Dr. Jones had been twice elected chairman of the Congregational Union of England and Wales and has been since 1930 moderator of the International Congregational Council.

The 97th Autumn Assembly was held at Bristol in October, when a resolution was passed that: "This Assembly views with alarm the rapid spread of clubs which are free from the licensing restrictions of the public house and lack proper supervision."

All churches in the union have been asked specially to observe Sunday, June 19, 1938, as the fourth centenary of the Reformation and of the royal command that a copy of the English Bible should be placed in every English church. Further conversations were held during the year between representative Presbyterians and Congregationalists with a view to closer co-operation.

The Rev. R. W. Thompson, Bristol, was elected chairman of the Union of England and Wales, 1938-39.

**Congress, United States.** First of United States Congresses to meet on Jan. 3 instead of on March 4, the Seventy-Fifth Congress met for its second session on Jan. 3, 1938, with the following list of members:

#### United States Senate (\*re-elected)

**Congressional Legislation.** It has been said of the first session of the 75th Congress that "Its most notable contribution to history was the rejection by the Senate of President Roosevelt's plan for the reorganization of the Supreme Court." One may also include the special session at the end of the year and conclude that the congressional sessions of 1937 were distinctive by reason of the number and the importance of the measures proposed by the President which were rejected. Important measures which were defeated included not only the court reorganization plan but also proposals to reorganize the executive branch, to set maximum hours and minimum wages for all employees of concerns engaged in inter-State commerce, to control agricultural production, and to extend the TVA principle to other portions of the country.

Important as were each of these measures in content, they were more important in number for they measured the depth of the congressional tide which for the first time since 1932 was beginning to run against the President. The President proposed thirteen major bills, of which Congress defeated six, partially agreed on two, and enacted but five in substantially the form in which they had been introduced. Various explanations of this unexpected rebellion have been offered. Chief among them were returning prosperity, the second-term tradition that the President loses legislative power with members of Congress, since he will not again run for office, and the crystallization of new political groups within the old parties. Post-session analyses agree that the true explanation probably lies in a combination of these possibilities.

Secondary to these basic considerations though still important in the chronicle is the fact that the failure of the President's program was due to recalcitrant elements within his own party rather than to the tiny Republican contingent in Congress. A good illustration is the Supreme Court bill against which every Republican Senator voted but none spoke. The opposition was more between Southern social and economic conservatism on the one hand and Northern metropolitan liberalism on the other than between Republican and Democrat. There are those who envisage these as the primary elements in a new and more basic cleavage of economic interests.

First to be considered must be the congressional effort to postpone the date of the reconsideration of some fundamental problems by means of the extension of the date of expiration of several of the emergency measures adopted in the first Roosevelt Administration. Included in these extensions were the Civilian Conservation Corps for three years, the Reconstruction Finance Corporation and the President's control of the monetary stabilization fund and the gold content of the dollar for two years, and the Soil Conservation Act for four years.

A sugar quota act, passed in the closing days of the session, provides for the annual determination by the secretary of Agriculture of the amount of sugar required by consumers in the United States, an allotment of 55.59% to domestic producers and 44.41% to foreign producers. The secretary is also empowered to make individual allotments whenever marketing conditions, a stable supply, or justice among the producers within given areas

may require. An important provision permits conditional payments to sugar farmers complying with conditions of production specified by the secretary. All sugar of domestic manufacture is subject to a graduated excise tax.

Further agricultural legislation took shape in a farm tenancy act which authorizes the secretary of Agriculture to make long-term loans to tenant farmers for the purchase of farms. Provision is made for loan appropriations of \$10,000,000 for the first year and \$50,000,000 for 1940 and each year thereafter. An important provision of the act requires the recipients to employ farm practices specified by the secretary. Of equal long-run significance is the authorization of the conduct of a program of land conservation and utilization including the retirement of submarginal lands. To administer its provisions the act creates a new agency in the Department of Agriculture to be known as the Farmers' Home Corporation.

Chief among New Deal concerns in the last session was the housing problem, and from it grew the most important legislation of the session. The act creates a U.S. Housing Authority in the Interior department which is authorized to issue \$500,000,000 of Government-guaranteed securities to finance loans to public housing agencies. The loans may not exceed 90% of the project cost nor may the annual subsidies for which provision is made exceed 80% of the total contributed by national and local agencies.

Students of American Federal government have been interested in recent years in the increased use of the inter-State compact as a method of coping with essentially regional problems. Seven such compacts received congressional consent during the last session. These compacts related to conditions of employment, the conservation of gas and oil, water-pollution and other major problems, in sharp contrast to the inter-State compacts of the past, which have usually been limited to minor matters such as boundaries and bridges.

Congress adopted but a small proportion of the reforms of the American judicial system which were urged upon it. The first measure to be enacted was that which permitted Supreme Court justices to retire on full pay once they had reached the age of 70 and had served for ten years. Later in the session, Congress agreed to a bill permitting the attorney-general to intervene in suits involving the constitutionality of Federal statutes and to appeal such cases directly to the Supreme Court. This act also restricted the use of the injunction with reference to the enforcement of congressional acts.

The Guffey-Vinson Act created a Federal Bituminous Coal Commission in the Interior department with broad powers to deal with such problems as price-fixing, marketing, and the regulation of business practices. Unlike the act of 1935 which the Supreme Court had invalidated, this act provided for labour only to the extent of asserting the right of employees to bargain collectively. Producers failing to become code members are subjected to a tax of 19.5% of the sale price of the coal.

The neutrality act of 1937 extends the provisions of the Act of 1935 for two years and also empowers the President to prohibit the carrying of articles to warring nations, and to require "cash and carry" purchasing by all belligerents. The arming of the American merchant vessels is specifically prohibited as is the travel of American nationals on the vessels of belligerents.

A Railroad Retirement Act was passed which provides for voluntary retirement at the age of 65 or at 60 if the employee has been in the service for 30 years or more. The pension system is to be administered by a Railroad Retirement Board on which labour, management, and the general public are to be individually represented.

A relief appropriation bill proposed by the President successfully weathered a bitter congressional storm. It appropriated

\$1,500,000,000, precisely the amount which the President had requested. A tax evasion study undertaken by the Bureau of Internal Revenue led to the passage of a "Tax Loophole" Act which sought to put an end to the ingenious tax evasion practices centring about the use of both domestic and foreign personal holding companies and deductions for losses from sales or exchanges of property, etc.

The special session which met on Nov. 15 did much discussing but had passed no important legislation when it finally adjourned at Christmas-time. (See also UNITED STATES: Congress.)

(G. C. S. B.)

**Connecticut**, one of the original States of the United States, popularly known as the "Nutmeg State" and the "Land of Steady Habits"; land area, 4,820 sq.mi.; population (U.S. census, 1930), 1,606,903, estimated by the Bureau of Vital Statistics, July 1, 1937, 1,766,947. Capital, Hartford, 164,072. Other cities of over 50,000 population in 1930: New Haven, 162,655; Bridgeport, 146,716; Waterbury, 99,902; New Britain, 68,128. Of the State's population 1,131,770 were urban, or 70.4%; 1,576,673 whites; 29,354 negroes; 1,222,267 native born; 384,636 foreign born.

**History.**—The principal State officers for 1937-39 were: governor, Wilbur L. Cross (Democrat, elected 1936 with 372,553 votes to 277,190 for his Republican opponent); lieutenant-governor, T. Frank Hayes; secretary of the State, C. John Satti; chief justice of the Supreme Court of Errors, William M. Maltbie (term, 1930-46). The only elections in 1937 were municipal, which showed no significant change in political trends. In the biennial session of the general assembly held in 1937, the Senate consisted of 26 Democrats, 9 Republicans; the House of Representatives of 167 Republicans, 100 Democrats.

The most important legislation of the session was a series of acts reorganizing the central administration of the State, which the governor characterized as "more vital and more comprehensive in character" than any group of acts passed since the adoption of the State Constitution in 1818. These acts, which greatly enlarge the powers of the governor, include the establishment of committees on inter-governmental co-operation, a legislative council, and a governor's cabinet, whose powers include certain functions in the interim between legislative sessions; of the Department of Finance and Control, administered by a commissioner, together with a budget director and a supervisor of purchases; of the Personnel Department to administer the merit system in the State's civil service; of the Department of Public Works; and of the Department of Welfare and the Public Welfare Council. The powers and duties of various State officers and commissions were redistributed and redefined to achieve more effective administration.

Provision was made for housing authorities to manage slum clearance projects; a State Traffic Commission, uniform traffic regulations on the highways, and the regulation of motor trucks; a 54-hr. week for employees of State institutions; unemployment compensation; service of women on juries; and no new taxation except adjustments in three schedules. The biennial budget, for

the first time, somewhat exceeded \$100,000,000; a bond issue of \$25,000,000 was authorized to fund the floating debt of about \$15,000,000 due to deficits in recent years and to provide new buildings for humane institutions. The funded debt already outstanding is fully offset by the sinking fund.

**Education and Charities.**—A new library and other buildings were being erected at the Connecticut State college at Storrs. The normal schools at Willimantic, New Haven, and Danbury were made State Teachers colleges with authority to confer the degree of Bachelor of Education. Since 1936 all new appointees at elementary and secondary school teachers must hold a bachelor's degree from a college or teachers college.

The State and local authorities co-operated effectively with the Federal Government in relief measures, and the general assembly designated the commissioner of welfare to administer all Federal aid granted to the State. The most important building projects under the bond issue mentioned above were a Veterans' Home at Rocky Hill, an additional School for the Feeble Minded at Southbury, and several more buildings at the new State hospital for mental cases at Newtown.

**Banking and Finance.**—For the year ending Sept. 30, 1937, the 73 mutual savings banks in the State showed an increase of \$25,006,139 in deposits and \$30,729,928 in assets. The number of depositors' accounts increased 26,278 to a total of 984,378 with total deposits of \$719,707,095. After Oct. 20, 1937, the bank commissioner limited the interest rate of these banks to 2½%. Hartford was the headquarters of most of 25 large insurance companies operating under Connecticut charters.

**Agriculture, Manufacturing.**—In 1935 Connecticut had 32,000 farms containing 2,000,000 ac. with products valued at over \$46,000,000. The most important crops are hay and tobacco. Dairying, poultry raising, fruit growing, and gardening are also important activities. Connecticut was, however, pre-eminently a manufacturing State. In 1935 the 2,840 factories employed 224,086 hands and produced goods valued at \$906,423,010. Metal industries, notably brass, were the most important. A goodly number of new or improved products were developed during the year. In 1937, until May, industrial activity improved in Connecticut above the average for the country. During the later months of the year there was steady decline but conditions continued somewhat better than the national average. Though there were many disputes between management and labour no serious or prolonged difficulties occurred.

**Conservative Party.** When, in 1931, the party, under the leadership of Lord (then Mr. Stanley) Baldwin, co-operated with representatives of the Liberal and Labour parties in the formation of a National Government under the leadership of Mr. Ramsay MacDonald, the success of that Government's efforts proved it to be possible for statesmen, possessing an entirely different approach to politics to join together in applying a common mind to the nation's ills. Mr. Neville Chamberlain, the present premier, who leads the Conservative party today, has set out the following as the guiding principles of the National Government and the Conservative party: (1) to keep the peace; (2) to make Great Britain so strong that nobody shall treat her with anything but respect; (3) to maintain and increase the prosperity and activity of trade and employment; (4) to carry on steadily the improvement of the conditions of the people.

WILBUR L. CROSS, governor of Connecticut

Throughout these years of international anxiety, the National Government has exerted supreme efforts to promote peace in the world. Where armed conflict has unfortunately taken place, Britain has consistently exerted its influence to localize the issue and so prevent it from involving other nations. The Conservative party supports the Government's endeavours to strengthen the authority of the League of Nations; to seek solutions of outstanding problems by means of economic and political collaboration; to restore faith in the integrity of treaties; and by strengthening the foundations for a common understanding to pave the way for a reduction in the burdens of armaments by means of international agreement. In particular, the party opposes the conception of rival ideologies and the grouping of powers into opposing blocs according to their different systems of Government.

Pending an international agreement which will give all countries a greater sense of security, the Conservative party is convinced that Great Britain must take the necessary steps to strengthen her defences in order to guarantee the safety of her world-wide communications and also enable her to fulfil her international obligations, holding that the present inadequacy of the system of collective security makes it all the more essential that Britain should repair the gaps in her defences which were caused by years of inactivity when she was striving by example to bring about international disarmament.

In its view of this question of peace and security, Conservative policy inevitably concerns itself with the position and attitude of the Empire. The Home Country is the connecting link between the various members of a great Commonwealth of Nations. They possess in common democratic government and a great and lasting love of liberty and justice. The influence they may exert as a factor in maintaining world peace cannot be exaggerated. Therefore, conservatism holds that everything possible must be done to maintain and strengthen the ties which bind Britain and the Dominions together.

The policy of the Conservative party with regard to domestic affairs may be stated with equal simplicity. It contends that the maintenance and enhancement of the industrial revival is dependent upon the increase and acceleration of Britain's already striking advance in social legislation, and that the recent improvement in the numbers of employed is based on the element of confidence, which in turn can be founded only on sound finance.

Where conservatism remains, and will remain conservative, is in its rigid conception of the elementary economic laws. It holds that to saddle industries with burdens they are unable to bear is the road neither to good trade nor good government; and that real social improvements can come only as the accompaniments of real industrial improvements.

The annual conference of the party was held at Scarborough on Oct. 7 and 8, under the chairmanship of Mrs. Clara Fyfe. On the second day, a memorable speech was made by the prime minister, Mr. Chamberlain, in the course of which he made extensive reference to the whole international situation. (D. HA.)

**Contract Bridge.** There was little advancement in the science of contract bridge bidding or play in 1937; no new legislation was effected; no significant competitions were played. In other years marked by the introduction of nothing generally interesting to adherents of the game, a consequent decrease in the amount of bridge-playing was noticeable. In 1937, according to all available evidence, no such decrease resulted. In Great Britain and the United States, indeed, a considerable increase was noted.

Statistics on which any gauge of the popularity of contract bridge is based are: (1) the number of playing cards sold and

(2) the number of books of bridge instruction sold. Manufacturers of playing cards report that sales in 1937 were approximately the same as in 1936. Publishers of books on contract bridge in 1937 exceeded their 1936 sales by more than 30%.

The laws prepared by the Whist Club of New York, the Portland Club of London and the Commission Française du Bridge of Paris in collaboration, which became effective Mar. 31, 1935, remained in force and were unchanged. These clubs announced with the introduction of that code of laws that no change would be made before 1940. A different code of laws governs tournament bridge, and the right to make changes is not so restricted, though no immediate change is contemplated. In the United States and in nearly every country of Europe the tournament laws are promulgated by national associations which are members of the International Bridge League, but not all of the European countries have adopted wholly the code of tournament laws which was prepared by an American committee. However, this code was used by the International Bridge League at its tournament at Budapest in June 1937, in which 18 different national bridge associations were represented, an Austrian team winning the championship and an American team finishing second.

The methods of bidding which were generally adopted in 1935 remained substantially unchanged and grew in popularity. Their outstanding feature is that there are almost no artificial bidding conventions included. An artificial bid is one which reveals some specific holding of high cards or suit-lengths by the bidder, the true meaning of the bid having been previously explained to the bidder's partner and opponents. A natural bid is one which reveals only the bidder's willingness to play the hand for the number of tricks and at the trump suit named in the bid. Average players and nearly all advanced players prefer to use a bidding system which emphasizes natural bids. Various systems involving the use of artificial bids were popular in Great Britain and America four years ago, but have gradually been abandoned until today they are seldom encountered in homes, clubs and tournaments. So great has been the opposition to artificial bidding, especially during 1937, that a bidding convention called the "asking bids," introduced into the Culbertson (Approach-Forcing) system of bidding in 1936 and highly recommended, is in 1938 withdrawn from published books on that system except for brief mention, and is now proposed for use only by very experienced players. The only such bidding convention which remains in general use is the "4-5 notrump convention" with which aces are shown for slam-bidding purposes.

It is perhaps due to failure to make changes in laws and bidding methods that the popularity of contract bridge has been maintained. While bridge analysts were still experimenting with bidding methods, and made frequent changes in their bidding systems, the average player was frequently called upon to forget rules he had already learned and accept new rules. Many players, unwilling to undertake the expense and trouble of learning new methods, stopped playing the game. Now that they are secure in the belief that bidding methods have become largely standardized, they play more regularly. The total number of bridge players in the world, 66% of whom are in America and Great Britain, may be estimated at the close of 1937 as 29,000,000. This is a higher figure than any authoritatively advanced before.

Bridge competition, from which championship titles and ranking of players must come, is better organized than in other years. In the United States, two factions which had been independently conducting championship tournaments united, and the resultant single organization, the American Contract Bridge League, is in a position to provide authentic championship titles and ranking of players. In Great Britain, two similar factions still oppose one another, calling themselves the British Bridge League and the

National Bridge Association. Only the former is a member of the International Bridge League, but the fact that many of the best-known players are allied with the latter association leads to disputed national rankings. In other countries the association which belongs to the International Bridge League is generally alone or predominant in the field.

The most important development in 1938 will probably not be in laws, in bidding or in play, but in the elimination of politics from the management of contract bridge tournaments and legislation, particularly in Great Britain. (E. CUL.)

## Conway, William Martin Conway,

1ST BARON of Ailington (1856–

1937), British mountaineer and art critic; born at Rochester, England, April 12, 1856; died April 19, 1937. For a biographical notice, see *Encyclopædia Britannica*, vol. 6, p. 363. He was created a baron in 1931. ## Copper.

Nine copper-producing countries with outputs, present or past, in excess of 50,000 tons, accounted for 90% of the world total in 1929, and 88% in 1936, which is only a comparatively small change, but in the meantime there has been a radical change in the status of many of the individual producers. World output as a whole decreased by 53% between 1929 and 1932, increasing by 1936 to 87% of the 1929 high; of this total, production outside of the United States dropped only 26%, and recovered to 23% above 1929, while the United States output declined by 75%, and recovered to only 60% of the former high; as a result, the United States proportion of the total has decreased from 49% to 33%. This change, however, has not been due to any physical inability to produce at the former rate, but to the general industrial depression, complicated by the discovery of rich new sources in Rhodesia and Canada, and the extension of Russian operations, all of which combined to divert from the United States a good share of its former export market. The United States still retains the position of leading producer, with 33% of the total, followed by Chile with 15%, Canada 12%, Rhodesia 8%, Belgian Congo 6%, Soviet Union and Japan each 5%, and Peru and Mexico each 2%.

World Production of Copper  
(In thousands of metric tons)

	1929	1932	1934	1935	1936
Belgian Congo . . .	135.5	54.0	110.1	107.7	95.7
Canada . . . . .	109.9	113.7	166.4	188.9	186.1
Chile . . . . .	316.8	103.2	256.7	267.1	256.0
Japan . . . . .	75.5	71.9	67.0	69.3	78.1
Mexico . . . . .	78.7	34.1	47.3	41.6	32.6
Peru . . . . .	54.4	21.4	27.7	29.7	32.9
Rhodesia . . . . .	5.9	73.0	145.6	148.2	140.0
U. S. S. R. . . . .	25.8	30.7	44.1	63.2	83.0
United States . . .	931.1	231.8	217.8	344.8	557.9
World Total . . .	1,921.6	905.5	1,266.3	1,459.5	1,667.7
Ex U. S. . . . .	990.5	673.7	1,048.5	1,114.7	1,109.8

Belgian Congo, Chile and Peru have decreased in output, but so nearly in the same ratio in which world output has changed that the percentage of the total furnished by each has not been materially altered, and the same is true of Japan, with a slight in-

crease; the greatest increase has been in Rhodesia, which rose from 0.3% in 1929 to 8% in 1936, followed by Canada, rising from 6% to 12%, and the Soviet Union, from 1% to 5%. The only other material decrease outside of the United States was Mexico, dropping from 4% to 2%.

COPPER PRODUCED in the United States: smelter output from domestic (including Alaskan) ores

Rearmament activities have been largely responsible for heavy increases in production in 1937. Preliminary estimates indicate a world output of about 2,100,000 metric tons, an increase of 26% over 1936; among the larger producers, Chile led with an increase of more than one-half, while the United States, Canada and the African sources stood at about one-third above 1936. Toward the end of the year, however, there was considerable restriction in output, the high point having been reached in the second quarter.

All of the countries listed in the table, with the exception of the United States, Japan and the Soviet Union, are comparatively small consumers of copper, and hence produce mainly for export. The chief copper consuming countries, in order of importance, are the United States, the United Kingdom, Germany, the Soviet Union, Japan and France, which cover nearly 90% of the total consumption. The United States is the only major consumer with an export surplus; all others are dependent on imports for a large proportion of their supply. On the face of the returns, during the past four years, imports into the United States have averaged 55% of the domestic output, and exports 77%, leaving a net export of 22%; however, the majority of the gross imports consists of ore, concentrates and blister copper imported under bond for smelting, refining, and re-export; deducting these items from both sides gives a net import for consumption equal to 9% of production, and a domestic export of 31%, leaving the same export balance of 22%. In spite of the fact that a material proportion of the output is exported, consumption of copper in the United States far exceeds the new copper supply, the remainder coming from secondary metal recovered from previous use, a source which yielded a larger amount of copper during the depression years than was obtained from the primary production.

The United Kingdom, the second largest consumer, has only a nominal output of a few thousand tons, and secures practically its entire supply from imports, a growing amount of which is re-exported. Most of the imports are from Empire sources, though the United States and Chile furnish appreciable amounts. Ore and matte make up only about 10% of the imports, the remainder being divided in about equal proportions between rough copper

and electrolytic. German refineries are now producing about 200,000 tons annually, about 85% of which comes from imports, 60% as crude copper and 25% in ore; exports are negligibly small. Russian production supplies about two-thirds of the demand, and imports one-third, while in Japan production is slightly less and imports proportionately higher. France has practically no domestic output, and imports almost the entire supply. (See also METALLURGY.) (G. A. Ro.)

**Copra:** see COCO-NUTS.

**Coptic Church.** This ancient Christian church of Egypt, with its branch established in Ethiopia by St. Athanasius about A.D. 326, after many years of quiescence was profoundly stirred in the latter half of 1937. The metropolitan of Ethiopia has always been an Egyptian appointed and consecrated by the Coptic patriarch of Egypt, but, after the occupation of Abyssinia by the Italians, the latter, in May 1937, sent the metropolitan, the Abuna Kyrillos, to Rome. Here ineffectual attempts were made to obtain his consent to the separation of the churches and he eventually returned, not to Abyssinia, but to Egypt. In September the Italian authorities announced that, while the metropolitan would be divested of certain powers, he would continue to be elected as before and consecrated by the patriarch, but on Dec. 1 the Abuna Abraham (aged over 70 and blinded by Italian gas) was invested as metropolitan at Addis Ababa in the presence of Marshal Graziani, the viceroy. Strong exception was taken to this, both by the church on canonical grounds, and by the Egyptian Government, which held it to raise diplomatic issues; but within a few days the new metropolitan consecrated three bishops and was himself proclaimed patriarch of an Italian-East African autocephalous church. On Dec. 12 Italy officially notified the Egyptian minister of foreign affairs to this effect.

On Jan. 4, 1937, the viceroy had opened, in the presence of the Abuna Kyrillos, the new Church of Mariam in Addis Ababa, the building of which, interrupted by the war, had been completed by the Italian Government.

**Corn.** The above-average corn crop in the United States in 1937 acutely changed the world's corn situation from that of the last several years since it returned the largest producer, the United States, again to the status of a corn exporter instead of an importer of maize. During the eleven months from Nov. 1, 1936, to Sept. 30, 1937, the United States imported 95,400,000bu. of corn and in that period was second only to the United Kingdom in the volume of maize imports. With the harvest of the 1937 crop of 2,644,995,000bu. the States resumed exports, although the Federal Government advanced loans of as high as 50 cents a bushel to growers who might wish to hold their crops either for live stock feeding or for higher prices. The 1937 production in the United States was 75 per cent larger than the short crop of 1,507,089,000bu. in 1936. The five-year (1928-32) average was 2,544,772,000bu. and the production of the disastrous drought year, 1934, was 1,478,000,000bu., which resulted in the United States becoming an importer of maize. The heaviest production since 1913 was that of 1920, 3,208,584,000 bushels.

The amount of corn harvested in 1937 in the United States was estimated by the Department of Agriculture as 2,343,258,000 bu., the remainder having been used for silage or forage.

Production of other corn-exporting countries in 1937 was given by the International Institute of Agriculture as, Argentina, 359,619,000bu., compared to 397,622,000 in 1936 and a five-year average of 304,862,000 bushels. The Danubian countries of Ru-

mania, Yugoslavia, Hungary and Bulgaria produced 515,682,000bu. in 1937, 561,281,000 in 1936 and a five-year average of 470,261,000 bushels. The Rumanian Government, however, has forbidden exports because of a short crop, but Yugoslavia and Hungary have a substantial surplus for export from record crops. Manchoukuo and Turkey had a combined crop of 5,200,000bu. in 1937, compared to 11,900,000 in 1936 and a five-year average of 6,100,000. Excluding Argentina, the Institute totals the crop of the exporting countries in 1937 at 3,454,200,000 bushels. This however, includes European countries which grow a part of their corn requirements and had a crop of 162,600,000bu. in 1937.

Of the 19 principal countries that import corn, eight produce none. These include the United Kingdom, which in the crop year of 1936-37 imported 144,144,000 of the 361,800,000bu. imported by all 19. It is estimated that import requirements will be about the same for 1937-38.

Italy now requires 10 per cent corn meal in all bread, in order to build up a wheat reserve.

Germany requires 7 per cent corn meal in bread and Portugal about 12 per cent, according to the quality of the bread, and this ratio may be raised to 20 per cent at the discretion of the minister of agriculture. While in some European countries there is an abundance of potatoes and root crops that may be used as live stock feed there is also a shortage of certain forage crops which offsets this advantage and indicates imports of maize.

Canada, which imported 18,369,000bu. of corn in the crop year of 1936-37 had a production of 6,492,000bu. in 1937, compared to 6,083,000 in 1936 and a five-year average of 6,025,000 bushels. In the United States normally about 80 per cent of the corn crop is fed to live stock on the farms.

There is, however, a shortage of about 10 per cent of live stock on United States farms. In the Argentine 80 per cent of the corn crop is grown for export.

The average yield of corn in the U.S. per harvested acre in 1937 was 28.2bu., compared to 16.2bu. in 1936. The ten-year average (1923-32) yield per acre was 25.4 bushels. The average 1937 acre yield was the highest since 1923, despite droughts in Nebraska, Kansas and South Dakota. The total acreage of corn harvested for all purposes in the United States in 1937 was 93,810,000 acres, compared to 93,020,000 acres in 1936. The five-year average is 103,419,000 acres. The Department of Agriculture estimates that 96,483,000 acres were planted to corn in 1937, while in 1936 the total acreage planted was 100,599,000, drought having caused a large abandonment of acreage by harvest time.

Corn from 5,140,000 acres was harvested for silage in 1937 in the U.S. In 1936 there were 8,309,000 acres that went into silage. The estimated production of corn silage in 1937 was 35,334,000 tons. This was a much heavier yield from a smaller acreage than in 1936 because of the larger crop from favourable growing weather. Silage production in 1936 was 32,419,000 tons.

Corn harvest time of the world is: January, New South Wales; March and April, Argentina; April and May, South Africa; September and October, all European countries; October and November, United States and Canada. (See also AGRICULTURE, *Technical Developments*; CEREALS.) (S. O. R.)

**Corn Borer:** see ENTOMOLOGY.

**Cornell University.** A non-sectarian, co-educational institution in Ithaca, N.Y., founded in 1865 and incorporated as a land-grant college under the Morrill Act of 1862. The university comprises the endowed schools and colleges of arts and sciences, engineering, architecture, law, and medicine (the greater part of which is in New York city), and the State-supported colleges of agriculture, home economics, and veterinary

SCENE FROM THE CORONATION of George VI of England (left centre) in Westminster Abbey May 12. Queen Elizabeth is seated at the right. In the royal box are, left to right, Queen Elizabeth's parents, the Earl and Countess of Strathmore; the Duchess of Kent, the Duchess of Gloucester, Queen Maud of Norway, Queen Mary, Princess Elizabeth, Princess Margaret Rose, Princess Mary

medicine. Two experiment stations, at Geneva and at Farmingdale, are operated in connection with the college of agriculture. Degrees for advanced study other than professional are awarded through a graduate school. There were 6,439 students, of whom 1,407 were women, enrolled in the autumn of 1937. The faculty includes 305 professors, 224 assistant professors, and 339 instructors. There are 122 extension workers in agriculture, and 79 in home economics. Important administrative changes became effective in the summer of 1937 through the retirement of Dr. Livingston Farrand, president since 1921, and the resignation of Provost A. R. Mann, who became vice-president of the Rockefeller General Education Board. Edmund Ezra Day, Ph.D., LL.D., succeeded Dr. Farrand as president. Productive funds on June 30, 1937, amounted to \$30,975,376, while income for current expenses was approximately \$8,339,285. Gifts received during the fiscal year totalled \$1,473,870. Land and buildings were valued at \$18,790,797, and equipment at \$7,698,897. (E. E. D.)

**Coronation.** The inauguration of King George VI at Westminster Abbey on May 12, 1937, took place under conditions different from those which attended any previous coronation. The increased facilities for the dissemination of news and pictures, before and after the event, resulted in the ceremony receiving the widest prominence in newspapers and periodicals everywhere, and the radio enabled the peoples of both the Empire and the world at large to keep in close touch with plans and preparations. On the actual day, they were able to hear the service, a privilege hitherto enjoyed by none other than those present inside the church. Furthermore, there has been much recent enquiry into the history of the ceremony, which has persisted unchanged in its essentials from time immemorial, though

constantly altered in detail to suit the temper of the period, and material was thus provided for many articles and books which quickened the general appreciation of the ceremony's historic and romantic aspects. There were also the unprecedented circumstances in which King George acceded to the throne, and the fact that his queen was the daughter of a British noble house. It was the first time for four centuries that a lady belonging to that sphere had shared the heritage of an English monarch.

The arrangements for the control of spectators on the day were carried out on a scale far beyond anything previously attempted, the latest scientific methods being applied to the organization. The faster and more extensive transport available for passengers led to an immense flow of visitors into London from all parts of the globe, and hundreds of thousands were able to watch the processions to and from the church in a greater degree of comfort than ever in the past. Throughout the proceedings, the radio enabled spectators to hear something of all that they could not see.

The coronation service itself, based on traditions going back a dozen centuries and founded on customary rites whose origin is still more ancient, has alone survived the test of modern criticism in so far as it should be regarded as the proper ceremonial for the sacring of a 20th-century Christian ruler. Wonder at such remarkable continuity greatly enlivened the general interest in the event.

The outcome of all these factors was that the imagination of the whole world was stirred, and in England an intense enthusiasm was aroused. The latter manifested itself especially in the scene at outstanding moments during the procedure on the day, such as the appearance of the King and Queen at the beginning of their journey from Buckingham Palace to the Abbey; their arrival

at the church; the placing of the crown of St. Edward on the King's head, and the culminating point in the ceremony when the King, crowned and invested with the ornaments of kingship, was raised upon his throne in the midst of his people. No useless effort need be made to describe these scenes; for there are few throughout the world who did not, thanks to the miracle of wireless, receive an impression of them at least better than could be conveyed in words.

The chief tendency of the changes wrought in the coronation ceremony has been to shorten it. In the 17th century, the procession from the Tower of London to Westminster on the day prior to the event was discontinued. Since the crowning of George IV in 1821, the elaborate banquet which followed the service has not been held.

The former part of the procedure is now represented by the procession from the Palace to the Abbey; but nothing has taken the place of the latter. There are many who would like to see the banquet resumed, and it was certainly a most interesting and colourful occasion; for, during its course, many ancient and picturesque services were performed, some of them, as that of the King's Champion, with great pomp. Moreover, the procession into the church then began in Westminster hall, instead of in the annex as now, and returned there after the service, thus allowing a far larger number of people to see it.

The most important alteration made on the occasion under notice was the revision of the oath. The origin of the oath was in the anxiety of the people to ensure so far as possible that they should be justly ruled, and to this end the King was asked to make certain promises, as, indeed, he still does, and not until he had done so was he anointed, crowned and invested with the emblems of kingship.

Various circumstances throughout the centuries have led to some amendment being necessary to the oath, and not least of these is the Statute of Westminster which changed the status of the King's dominions. The Irish Free State also had to be considered.

Thus, King George V swore to govern "the people of this United Kingdom of Great Britain and Ireland and the Dominions thereto belonging, according to the statutes in Parliament agreed on and the respective laws and customs of the same"; but for King George VI the passage read: "the peoples of Great Britain, Ireland, Canada, Australia, New Zealand, and the Union of South Africa, of your possessions and other territories to any of them belonging or pertaining, and of your empire of India, according to their respective laws and customs." The promise involved in the third question was changed so that the King undertook to "maintain the laws of God and the true profession of the Gospel" throughout his domains; but to maintain "the Protestant Reformed Religion established by law," in England and Scotland only, and "to preserve inviolably the settlement of the Church of England, and the doctrine, worship, discipline and government thereof, as by law established in England," in England alone.

In this way, the oath has been brought up to date, and continues to represent—as it was always meant to do—the will of the people, and, in the words of Professor Trevelyan, it "is still a vital and growing reality."

Another alteration in the service was the omission of the sermon.

Notwithstanding these revisions, King George VI was crowned according to ancient rites which remain fundamentally unchanged, and amid demonstrations of loyalty which significantly indicate the strength of his throne. (See also PHILATELY.) (J. G. N.)

**Cosmetics:** see SOAP, PERFUMERY AND COSMETICS.

**Cosmic Rays:** see PHYSICS: Cosmic Rays.

**Costa Rica,** a Central American republic; language, Spanish; capital, San José (pop. 56,000); president, León Cortés. The area is 23,000 sq.mi.; population (estimate 1935) 578,040. The year 1937 was marked principally by efforts of President Cortés to put the country on a more solid basis through a debt adjustment with foreign bondholders, a reciprocal trade agreement with the United States, and stimulation of the coffee industry. There are 450mi. of railways, and highway, and river communication. In 1936, imports (largely foodstuffs and manufactured goods) aggregated \$9,388,000 in value, principally from the United States (39%) and Germany (31.7%). Imports from Japan increased sharply in 1937 and caused threats that a near-prohibitive duty would be imposed, inasmuch as Japan bought practically nothing. Exports in 1936 were valued at \$8,825,000 (coffee, 56.8%, and bananas, 35.5%), to the United States (41.7%), Great Britain (24.5%), and Germany (21.2%). The principal products are coffee and bananas, the mainstays of the country's economy. Cacao is also produced. Some gold is mined. The monetary unit is the colon (value: 17½¢ U.S.). The national budget for 1937 was \$4,009,207.91, of which over 20% was allotted to education. There are over 600 schools with more than 60,000 enrolment. (L. W. BE.)

**Cost of Living.** The upward trend of the cost of living after 1933 continued into 1937, but only in France and Norway (excluding war areas) did 1937 indexes of food prices go higher than in 1929. In most nations 1937 food prices were higher than 1936; but the official indexes of Germany, Austria, and South Africa show very little change. The increases ranged around five points in the United States, Great Britain, Australia, Bulgaria, Estonia, Hungary, Ireland, Netherlands, Poland, and

AN UNWELCOME PASSENGER insists on riding. Cartoonist Jensen's way of saying in *The Chicago Daily News* that legislative devices to raise wages also elevate prices

## Indexes of Retail Food Prices in the United States, United Kingdom and Certain Other Countries

(This table is rearranged and condensed from a table in *The Monthly Labor Review*, January 1938, pp. 265-267.  
Official sources of data and scope of data shown in *The Monthly Labor Review* table.)

The number of articles included in the indexes for the various countries varies widely. The indexes are not absolutely comparable from month to month over the entire period for certain countries, owing to changes in the numbers of articles included at different dates.

\*July.

Sweden, and were definitely below 5% in Canada, Australia, and Czechoslovakia. But Great Britain, Finland, Belgium, Norway, and Switzerland experienced almost a 10% increase in food prices in 1937.

The inclusion of rent, clothing, fuel and light, and sundries would change the picture somewhat. The British Ministry of Labour (*The Ministry of Labour Gazette*, Jan. 1938, p. 5), which furnishes the most complete cost of living picture available in Jan. 1938 for the year 1937, reports that while food prices in Great Britain increased nearly 8% in 1937 the cost of living of wage earners increased but 5%. Rents did not rise measurably, fuel and light rose less than food costs, and clothing no more than did foods. In Canada, food prices increased sharply from an average index number of 108.5 in 1936 to 117.6 in 1937; but fuel, light and rent remained practically constant and clothing increased but slightly (*The Labour Gazette*, Department of Labour, Canada, Jan. 1938, p. 115).

The detailed figures of the United States, Canada and the United Kingdom reveal that the trends of prices of different foods varied considerably during 1937. In Great Britain, for instance, all major food items became more expensive except fish, margarine, and potatoes. In the United States, meats were approximately 10% higher in Nov. 1937 than in Nov. 1936; dairy products but 4-4% higher; beverages, chocolate, sugars and sweets little higher; and fruits and vegetables, eggs, fats and oils lower.

The accompanying table shows the relative trends of retail food prices in 11 countries from 1929 through Oct. 1937. The period used as a base by each country is indicated and reference is given to an article in the *Monthly Labor Review* from which information about additional countries may be obtained. (See also PRICES, STATISTICS OF.)

BIBLIOGRAPHY—Readers interested in additional information are referred to current issues of the *Monthly Labor Review* (U. S. Bureau of Labor Statistics), the *Ministry of Labour Gazette* (British Ministry of Labour), and *The Labour Gazette* (Department of Labour, Canada). (D. D. L.)

**Cotton.** The world produced and used more cotton in 1937 than ever before. Production was estimated in round numbers at 38,000,000 bales for the calendar year; consumption, 31,000,000 bales. The cotton year, however, begins Aug. 1 and statistical data are reported as of each twelve months following that date. The previous high record, both in production and

consumption, was for the immediately-preceding crop year of 1936-37 when world production was 30,700,000 bales and consumption, 30,991,000 bales. The third largest annual production for the world was 27,930,000 bales in 1926-27.

During recent years, while the U.S. was restricting production by granting subsidies on acreage withdrawn from cotton growing, South America has rapidly extended its acreage, especially in Brazil and to some extent in Argentina, and has become one of the world's important cotton producers. While the acreage planted to cotton in Asia and Africa has been expanded to some extent, the larger crops in those areas are chiefly the result of increasing the yield per acre. In 1936-37 India, Egypt, China, Russia and Brazil had high-record crops. These conditions of increased acreage and higher yields have resulted in making cotton more abundant and cheap, thereby encouraging the manufacture of cotton products and their largest use thus far in world history.

The carryover of cotton from 1936-37 to the current year of 1937-38 was 13,313,000 bales of 478lbs., net, to the bale. Of this 6,235,000 bales was U.S. cotton. The remainder, 7,078,000 bales, was the total carryover from all other cotton countries.

**Production by Countries.**—For 1937-38 and the preceding year the International Institute of Agriculture gives the following figures of production in the principal cotton-growing countries. To facilitate comparison the 1936-37 figures are here placed in parentheses. The Institute's data are for bales of 478lbs., net, and are as follows:

United States, 18,746,000 bales (12,407,000). India, 4,547,000 bales (4,497,000). Russia, 3,482,000 bales (3,551,000). Egypt, 2,282,000 bales (1,887,000). China, 3,225,000 bales (3,914,000). North Brazil, 868,000 bales (640,000). Mexico, 326,000 bales (359,000). The 1936-37 production for South Brazil was 1,201,000 bales and for Argentina, 143,760 bales. The forthcoming 1937-38 crop in the Argentine promises still larger production because of increased acreage.

The five-year average, annual production of cotton for the period ending in 1935-36 is reported by the International Institute of Agriculture as follows: United States, 12,684,000 bales. India, 3,768,000 bales. China, 2,434,000 bales. Russia 1,947,000 bales. Egypt, 1,491,000 bales. North Brazil, 549,000 bales. South Brazil, 480,000 bales. Argentina, 238,000 bales. Mexico, 209,000 bales.

**United States.**—The largest cotton crop ever produced in the

U.S. was that of 1937, which, the U.S. department of agriculture estimates, was 18,746,000 bales, from 33,930,000 acres. The previous high record was 17,978,000 bales from 47,087,000 acres in 1931. In 1931 production was 17,097,000 bales from 38,705,000 acres. Other high production years were 1914 when 16,135,000 bales were produced from 36,832,000 acres, and 1925 when production was 16,104,000 bales from 48,090,000 acres. In no years, other than the foregoing, has U.S. cotton production been as much as 15,000,000 bales, although it came close to that figure in 1928 and in 1929. For 1936 production was 12,407,000 bales. It was 10,638,000 bales in 1935. The lowest yield since 1921 was 9,636,000 bales in 1934. The years 1933 and 1932 were average; 13,049,000 and 13,003,000 bales, respectively.

The record U.S. crop in 1937 from a comparatively small acreage was owing to favourable growing conditions, a larger use of fertilizers and to the Government's soil conservation program to withdraw land from cotton and adopt soil-building practices of liming, terracing hillside fields to prevent erosion and planting legumes and crops other than cotton, which has long been the great cash crop of the South. Previously the Government had suspended its policy of granting loans to farmers to enable them to hold their cotton off the market when prices were low. Instead a direct subsidy was granted for acreage withdrawn from cotton. Government loans were resumed late in 1937. In 1936-37 the Government held 3,159,675 bales taken for unpaid loans, but this had been reduced to 1,677,559 bales by the beginning of the 1937-38 year.

**Cottonseed.**—The huge world cotton crops have directly affected world markets for vegetable oils and animal fats since cottonseed oil is widely used in foods and various industrial processes and competes actively with butter, lard, copra and soybean and peanut oil, marine oils and other similar products. No reliable data are available for current world production, as the grinding and pressing of the seed from a crop are not completed until after seed requirements for the succeeding planting are met. In the U.S. 1,003,457,968 lb. crude cottonseed oil were produced from the grinding of the small crop between August 1, 1936, and January 1, 1937. (See also VEGETABLE OILS AND ANIMAL FATS.)

(S. O. R.)

**Cotton Manufacture.**—Although great strides have been made in the manufacture of piece-goods from synthetic fibres, cotton comprises by far the bulk of world production. It is the cheapest form of clothing produced, and as a result, is the lowest-priced and most economical form of wearing apparel for the millions of low-wage earning peoples in world countries. The four largest manufacturing countries are the United States, United Kingdom, India, and Japan. The United Kingdom and Japan export a large proportion of their output. The United States' production is mostly for home consumption. India was formerly in this category, but latterly she has been able to increase her exports, especially to British colonies, and now is looming large as a competitor of the United Kingdom.

The world production of cotton piece-goods has shown little change in the past few years. According to a census of cotton looms taken by the International Federation of Master Cotton Spinners' and Manufacturers' Associations, the total number of world looms in three years to Jan. 1, 1937 (the date of the census and the latest figures available) showed an increase of only 10,526. Looms in Great Britain had declined by 83,191 in three years, and in the United States by 40,181. These decreases were offset by increases in Russia, Japan, China, India, and in certain less important countries. It is obvious, therefore, that eastern countries, chiefly on account of relatively low wage rates and longer hours worked in the mills, are making steady progress in the production of cotton goods, whereas the tendency in Europe,

and particularly in Great Britain, is to decline.

The growth of competition by Eastern countries has been causing increasing anxiety to European, and particularly British, manufacturers, and this movement is likely to increase on account of the factors mentioned above. It was, of course, inevitable that cotton manufacturing in India, Japan, and China should increase as those countries became more westernized, but the growth has been more rapid than trade leaders anticipated. Production in Great Britain is now estimated to be at around 4,000 million square yards a year, and about half of this quantity is exported, the other 2,000 million square yards being consumed in the home market. Prior to the World War, British exports alone totalled to nearly 7,000 million square yards, which represented 75% of the total British output.

According to the latest figures of production, the Indian mills are now producing at the rate of 4,000 million square yards a year, which is equal to Britain's output. As a point of interest, however, India still imports a large quantity of cloth, the 1936 total from the United Kingdom being 416.4 million square yards and 355.7 million square yards for the 12 months of 1937. For the 12 months ended March 31, 1937, imports from Japan totalled 472.6 million square yards. The total exports of cotton piece-goods to all countries, from the United Kingdom for the 12 months ended Dec. 31, 1937, totalled 1,921,918,000 square yards, as compared with 1,916,604,000 square yards in 1936. British yarn exports amounted to 159,098,500 lb. as compared with 150,924,800 lb. in 1936.

One of the most important developments in textile manufacture, especially in Great Britain, has been in the production of piece-goods made from spun staple fibre. The raw material is being produced by the principal rayon companies in increasing quantities, and production of this particular type of cloth is expanding rapidly. It is not possible to obtain figures as to yardage, but a large number of Lancashire spinning mills are utilizing this relatively new method of producing rayon yarn. Briefly, it is the rayon filament cut into staple lengths, spun on a spinning frame, and then manufactured into cloth. The method improves the "feel" and texture of the finished rayon fabric.

With regard to textile machinery, no revolutionary improvements have been made during the past 12 months, but at the same time machinery makers have been concentrating their attention on the production of mechanisms and apparatus for the more economic production of yarn and cloth. In the spinning section, the

COTTON CROP in the United States. The figure for 1937 is the Department of Agriculture's final estimate (December). Highest previous record was in 1926

use of high-speed cages for the elimination of dust and dirt is of great interest. This is important from the operatives' point of view, as it should lead to a reduction in illness caused by respiratory disease.

Perhaps the most important step taken in spinning mills during the past few years has been the introduction of the high draft system of spinning. This system has been adopted particularly in the United States and in Great Britain, but it is now being taken up by other cotton spinning and manufacturing countries. Another interesting feature has been the increasing use of variable speed motors for driving ring frames. It has been adopted satisfactorily, not only in its application to ring frames, but also to winding machines and other types of machinery in a cotton mill where variable speed is necessary.

Important progress has also been made in the development of machines and processes which lie between the spinning spindle and the loom. Improved types of winding and warping machines have been produced, which, while obtaining the increased speed and production demanded, ensure that the wound packages and the completed warp maintain a high degree of quality.

There has also been a definite development in the use of the cotton system as against the horizontal mill system for the production of rayon warps. The first-named system has been very largely adopted in the United States, and costs of production have been materially reduced. Increased speeds in these earlier processes have brought about the introduction of improved sizing machines, both for cotton and rayon, and they have enabled greater production to be secured when slashing. Seven-cylinder sizing machines are now obtainable.

Warp stretch control apparatus has been applied to sizing machines, with the result that modern warps, even though they are produced at a very much higher rate of speed than the old type warps, are infinitely better in regard to the elasticity of the yarn and warp in general.

With regard to cotton looms, probably the most important development has been in general construction. This applies also to the manufacture of automatic looms, and practically every type of cloth, from low-grade qualities to intricate fancy weaves, can now be produced by automatic machinery.

**World Cotton Machinery: Spindles.**—The following are official statistics of spindles in the chief producing countries compiled by the International Federation of Master Cotton Spinners' and Manufacturers' Associations, as of July 31, 1937.

	Spindles
United States . . . . .	26,664,000
Great Britain . . . . .	38,753,000
Japan . . . . .	11,889,000
Germany . . . . .	10,236,000
*Russia . . . . .	10,050,000
India . . . . .	9,876,000
France . . . . .	9,783,000
†Italy . . . . .	5,483,000
*China . . . . .	5,071,000
Czechoslovakia . . . . .	3,445,000
Brazil . . . . .	2,714,000
Belgium . . . . .	2,004,000
Spain . . . . .	2,070,000

\*Estimated. No returns received.

†Figures for July 31, 1935.

The number of world spindles amounts to 149,618,000. Of this total, 88,733,000 are in Europe, 26,827,000 in Asia, and 31,674,000 in the United States and South American countries. The total in other countries is 2,384,000. The spindles in course of erection on July 31, 1937, totalled 122,000 in Europe, 177,000 in Asia; U.S. figures are not available.

The following table shows the number of active spindles in

the leading American States and the total for the whole United States in 1937:

State	Number	% of Total
North Carolina . . . . .	5,636,708	23.4
South Carolina . . . . .	5,488,761	22.8
Georgia . . . . .	3,050,805	12.7
Massachusetts . . . . .	3,019,222	12.5
Alabama . . . . .	1,746,006	7.2
Rhode Island . . . . .	815,023	3.4
Maine . . . . .	636,380	2.6
Virginia . . . . .	613,624	2.6
Connecticut . . . . .	606,435	2.5
Tennessee . . . . .	576,727	2.4
New Hampshire . . . . .	554,448	2.3
New York . . . . .	291,566	1.2
Texas . . . . .	211,988	.9
Mississippi . . . . .	171,829	.7
All others . . . . .	660,415	2.7
United States . . . . .	24,979,937	

**Looms.**—According to the International Cotton Loom Census taken by the International Federation of Master Cotton Spinners' and Manufacturers' Associations, the total number of world looms on Jan. 1, 1937 (latest figures available), amounted to 3,070,395. This number includes both ordinary and automatic looms. The following table shows the number of looms in place, based on actual returns, in the principal countries:

Country	Ordinary	Automatic	Total (including automatic attachments)
*United States . . . . .	181,123	392,329	573,452
Great Britain . . . . .	483,984	15,224	504,773
Japan . . . . .	292,564	40,000	332,564
†Russia . . . . .	216,000	25,000	250,000
India . . . . .	197,363	4,185	201,548
Germany . . . . .	169,800	18,200	200,500
France . . . . .	152,800	37,700	193,900¶
†Italy . . . . .	91,500	33,500	146,500
Czechoslovakia . . . . .	100,890	1,930	104,180

\*Approximate figures compiled by Cotton Textile Institute of New York.

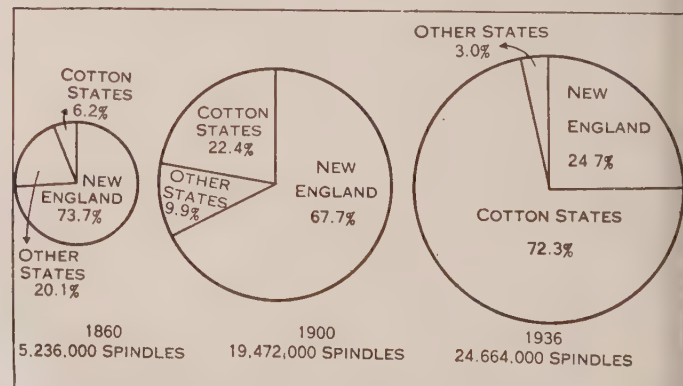

†No returns. Figures estimated from trade sources.

‡No returns. Jan. 1934 total given.

|| International Federation estimates.

¶Excludes 8,600 linen looms usually working on cotton or cotton and rayon cloths.

The world total of all looms, including ordinary, automatic and those with automatic attachments on Jan. 1, 1937, and Jan. 1, 1934 (the previous census), is as follows: Europe 1,776,580; America 766,065; Asia 515,469, as of Jan. 1, 1934; Europe 1,742,202; America 724,727; Asia 599,800, as of Jan. 1, 1937. The world's total of ordinary looms: 2,411,227 as of Jan. 1, 1934 and 2,344,183 as of Jan. 1, 1937; of automatic looms: 596,596, Jan.

COTTON MANUFACTURING in the United States: total number of active spindles in 1860, 1900, and 1936 (indicated by area of circles) and distribution among the States in each year

1, 1934, and 662,167, Jan. 1, 1937; of looms with automatic attachments: 52,046, Jan. 1, 1934 and 64,045, Jan. 1, 1937.

**Coubertin, Pierre de Fredi de,** <sup>BARON (1863-1937),</sup> French author and organizer of the modern Olympic Games, was born in Paris, Jan. 1, 1863. Convinced in 1883 of the necessity of sports instruction in French schools, he began work which resulted in the inauguration of interscholastic contests in 1889. This accomplishment was soon followed by a desire to stimulate international competition. From 1894 until his retirement in 1925, he saw active service as president of the International Olympic Committee, which sponsored the quadrennial revival of the ancient contests starting in 1896. Throughout his life, he was a determined opponent of all commercialization of athletics. He was author of *L'Education en Angleterre, Universités transatlantiques, Souvenirs d'Amérique et de Grèce, L'Evolution française sous la IIIe République*, and *Memoires Olympiques*. He died at Geneva, Sept. 2, 1937.

**Countries of the World, Areas and Populations of the:**  
see AREAS AND POPULATIONS OF THE COUNTRIES OF THE WORLD.

**Cox, Sir Percy Zachariah** <sup>(1864-1937),</sup> British administrator, who as acting minister to Iran during 1918-20 negotiated the Anglo-Persian Treaty. Transferred to Mesopotamia as High Commissioner in 1920, he became known during his three-year administration as the "king maker" for the part which he played in establishing the new Arab state of Iraq and in placing Emir Feisal on the throne. Sir Percy's last official act was to represent India at the Geneva Conference of 1925 for framing a convention for control of the arms traffic. After his retirement he served as president of the Royal Geographical Society (1933-36). His death occurred at Melchbourne, Bedfordshire, on Feb. 20, 1937. An account of his career may be found in the *Encyclopædia Britannica*, vol. 6, p. 625.

**Craftsmanship.** In modern speech, the word "craftsmanship" means the skill of the workman in the use of his hands or tools as manifested in a thing made. There is therefore no craftsmanship in the product of automatic machines, though the machines themselves may be admirable examples of it. The development of machine manufacture during the past 150 years, called forth by the universal application of the principle of production for profit, *i.e.*, for the profit accruing to the owners of invested capital, has had the inevitable result of lessening the number of craftsmen required, and has also effected the destruction of many crafts, *i.e.*, trades depending on the supply of craftsmen.

This result is deplored by those who demand that things made for human use should be in their actual substance the product of human sensibility. It is deplored by those who know that men and women demand that things for daily and household use shall be as ornamental as they used to be in pre-industrial times, but that only starkly plain and functional things can properly be made by machines, and that the result of the mechanization of industry has been to flood the world with bad imitations of ornament. And it is deplored by those who see in our industrialism a destruction of human responsibility; for the worker in the factory is not responsible for what the machine makes (a machine makes only what it is designed to make), and is therefore, in fact, only a sentient part of the machinery.

On the other hand, the destruction of craftsmanship in the

making of the ordinary necessities of life has caused a special value to be placed upon the work of those few special individuals who still pursue the ancient pre-industrial methods of making. It was formerly true to say that "the artist is not a special kind of man, but every man is a special kind of artist." Now, this is true no longer. The artist is a very special kind of man, and the factory workman in his working hours has been reduced to a subhuman condition of intellectual irresponsibility.

Moreover, the works of these special artists, owing to their comparative costliness, are purchasable only by the comparatively rich. The consequence is that, for the most part, only those objects are made for which the richer class of buyer has a liking. Many of these objects, in spite of the artificial circumstances of their production and their consequent self-consciousness, display a quality of craftsmanship unsurpassed in pre-industrial times. In the "fine arts," craftsmanship has declined, because it is supposed to be a hindrance to the free expression of sensibility, but in the works of those called "artist-craftsmen" (to distinguish them from "factory hands"), craftsmanship has advanced and is venerated for its own sake.

The future of craftsmanship depends upon the future of machine industry, and the future of industrialism depends upon the future of banking. At this point the subject must be left for elucidation by financiers and economists. (E. G.)

**Crane, (Robert) Bruce** <sup>(1857-1937),</sup> American landscape artist, was especially noted for his paintings of autumn scenery. Born in New York City, Oct. 17, 1857, he died in Bronxville, N. Y., Oct. 30, 1937.

**Cricket.** Cricket rivalry between England and Australia has gone on for 60 years, but rarely has a series of matches between the countries proved of such absorbing interest as that in Australia which ended in March 1937, with Australia winners by three games to two. When the year dawned, England was two up. In each test success had fallen to the side which won the toss, and this also applied to the three remaining games. Never before has a side emerged victorious after losing the first two matches in a rubber of five. Results:

First test (Brisbane).	England won by 322 runs.
Second test (Sydney).	England won by an innings and 22 runs.
Third test (Melbourne).	Australia won by 365 runs.
Fourth test (Adelaide).	Australia won by 148 runs.
Fifth test (Melbourne).	Australia won by an innings and 200 runs.

On the whole the teams were very equal, but the phenomenal batting form of D. G. Bradman, the Australian captain, turned the scales. In both the third and fourth tests, Bradman hit a score of over 200, and he also reached three figures in the final game. Bradman, who had a batting average of 90, surpassed all other performances for Australia during the series, and when L. Fleetwood-Smith was fit to play he and W. J. O'Reilly formed a deadly pair of spin bowlers.

O'Reilly in the tests took 25 wickets. For England W. R. Hammond (Gloucestershire) and M. Leyland (Yorkshire) carried off chief batting honours, and the most effective bowling was done by W. Voce, of Nottinghamshire.

D. G. Bradman, scoring 810 runs, raised his aggregate against England to 3,406, which is the highest in the whole series by an Australian, and is surpassed only by J. B. Hobbs for England. In the first test, W. A. Oldfield (Australia) set up a new record for the number of batsmen dismissed by a wicket-keeper in the England-Australia matches. In all he has dismissed 90 batsmen.

The following record partnerships were established: Third

wicket (record for Australia), 249 by D. G. Bradman and S. J. McCabe in the fifth test at Melbourne. Sixth wicket (highest stand for any wicket in an England-Australia test in Australia), 346 by D. G. Bradman and J. H. Fingleton for Australia in the third test at Melbourne. In the third test, each side declared its first innings closed—an unprecedented happening in test cricket.

All attendance records for a test match were smashed when, at Melbourne on the third day of the third test, 87,798 persons were present. The returns for the whole match were 350,534 spectators and £29,687 in gate receipts.

Another test series followed, between England and New Zealand in England. England's victory by 130 runs at Manchester—in the only game of three that was finished—decided the rubber, but the issue might have gone the other way had New Zealand held catches at a critical point. The success of J. Hardstaff (Nottinghamshire) in making centuries both at Lord's and at The Oval was noteworthy. Although the New Zealanders won only 9 of 32 first-class matches, there was much promise in the batting of M. W. Wallace. The bowling of J. Cowie (medium-fast) was wonderfully steady and accurate, equal to that of any bowler in modern cricket. On their way home the New Zealanders played several matches in Australia.

Keen interest in the county championship was sustained until the last few days of August. Not for many years had the competition produced such a stern struggle for leading honours and such a wealth of entertaining cricket. Middlesex ran Yorkshire very close, and the lead changed hands four times, but Yorkshire finished champions. This fight for supremacy between north and south had an interesting sequel when a challenge match between the two counties was played in September. Middlesex was vanquished by an innings and 115 runs, but the game captured the imagination of the public, and charities benefited appreciably from the receipts. The final positions in the championship table were:

	P.	W.	L.	Won on 1st Inn.	Lost on 1st Inn.	No. Res.	Pts. Poss.	Pts. Obt.	Per- cent- age
Points awarded . . .	15	..	5	3	4	..	..	..	..

Northamptonshire .	24	0	16	4	3	1	360	33	9.16

Of several new records made during the season, that of J. H. Parks (Sussex) was outstanding. Parks, by scoring 3,003 runs and taking 101 wickets, accomplished a feat which is unparalleled. For the first time, two players on the same day hit a score of 300; R. H. Moore (Hampshire) made 316 and E. Paynter (Lancashire) 322. The fastest piece of scoring ever seen in first-class cricket was that of Kent against Gloucestershire at Dover. Kent needed 218 runs to win, and scored them in 71 minutes.

The distinction of making two centuries in a match was enjoyed by four batsmen: C. S. Dempster (Leicestershire), L. E. G. Ames (Kent), D. R. Wilcox (Essex), and L. B. Fishlock (Surrey). "Hat-tricks" numbered ten, and W. Copson (Derbyshire), H. J. Butler (Nottinghamshire), and D. V. P. Wright (Kent) twice performed this feat, Copson in one match—against Warwickshire—taking four wickets in as many balls. A remarkable bowling

effort during the summer was that of J. C. Clay (Glamorgan), who in his 40th year, took 17 wickets in a match against Worcestershire.

W. R. Hammond (Gloucestershire), the one other batsman besides Parks to score 3,000 or more runs, headed the English batting averages, as he did in 1936, with an aggregate of 3,252 runs and an average of 65.04. Next in order came J. Hardstaff (Nottinghamshire), who averaged 57.72, and L. Hutton (Yorkshire) was third in the list with 2,888 runs, including 10 centuries.

The selectors of England teams (Sir Pelham Warner, Mr. R. A. Perrin, and Mr. T. A. Higson) searched in vain for new bowlers of the class required for representative cricket, and bowling honours were again distributed among the seasoned players. T. W. Goddard (Gloucestershire) was surpassed as regards average by H. Verity (Yorkshire), but he took 248 wickets, which was more than anyone else. Among several well-known cricketers who decided to retire at the end of the season were E. Hendren (Middlesex), who during a career dating back to 1907 scored 57,592 runs, A. Sandham (Surrey), and J. C. White (Somerset); and Sussex decided not to re-engage M. W. Tate.

To celebrate the 150th anniversary of the M.C.C., a week's high-class cricket was played at Lord's in May. South beat the north by six wickets, and the M.C.C. Australian XI overcame the rest of England by 69 runs.

In May the M.C.C., by unanimous vote, sanctioned an alteration in Law 24 which deals with leg-before-wicket. An experimental rule had been in operation during 1935 and 1936. The change means that the striker may be out to a ball which, pitching on the off side of the striker's wicket, would have hit the wicket had it not been intercepted by part of the striker's person (except his hand) which part was between wicket and wicket at the moment of impact.

Before the season began the counties invited the M.C.C. to appoint a commission to investigate problems confronting first-class cricket. In December the commission (Mr. W. Findlay, Mr. R. C. N. Palaret, and Mr. R. H. Mallett) issued their report, which made certain recommendations concerning the finances of cricket, suggested a revision of the method of scoring county championship points, and of the conditions under which a player might qualify for a particular county, and recommended a stricter adherence by county teams to the hours of play.

Lancashire second eleven became champions of the minor counties competition by beating Surrey second eleven in the challenge match. There was strong competition for honours from Hertfordshire as well. A feature of the season was a performance of N. Harding, a medium-fast bowler, who took 18 wickets for Kent against Wiltshire.

Winners of the several competitions played overseas were as follows:

Sheffield Shield (Australia)—Victoria.

ENGLAND VS. NEW ZEALAND at Lords, June 28, 1937. Illustrating how Gooldee set up his slips to trap J. L. Keed, New Zealand

(See also CHICAGO; FEDERAL BUREAU OF INVESTIGATION; JUVENILE DELINQUENCY; LIE DETECTOR; POLICE; RACKETEERING; STATE LEGISLATION: *Crime Control*; UNITED STATES: *Crime*.) (G. W. KI.)

**Great Britain.**—Whereas the number of persons under 16 years of age found guilty of indictable offences is increasing rapidly (see JUVENILE DELINQUENCY), the number of those in higher age-groups is beginning to show signs of decline. From the high level of 51,180 in 1932, for example, the number fell in 1935, the latest year for which complete statistics are available, to 47,424.

These statistics show that the incidence of crime is nearly eight times greater among males than females: 370 out of every 100,000 men and boys in the population were found guilty of indictable offences, the corresponding figure for women and girls being only 47, though the number of females charged has shown a steady increase since 1930.

Of every 1,000 men and boys found guilty of indictable offences, 10 were under the age of 16, 7 between 16 and 21, 4–5 between 21 and 30, and 1–2 over 30.

In about 74% of the cases of indictable offences, the crime was larceny, and in more than half of these the persons charged were under 21. Next in order of frequency comes fraud and false pretences with 10%, "breaking and entering" (7%), miscellaneous offences, including attempted suicide (4%), and sexual offences and offences against the person with 3% each.

Of 168,485 cases of theft known to the police (involving 30,347 cases of "breaking and entering" and 138,138 cases of larceny), the value of the property stolen was under £5 in 79.5% of the cases, between £5 and £100 in 19.3%, and over £100 in 1.2%. A recent analysis of property stolen in the Metropolitan Police District showed that in 30% of the cases the value was £1 or less. The most common form of larceny is theft from shops and stalls, followed by thefts of pedal cycles, thefts from unattended vehicles, "larceny by a servant," and thefts from automatic machines and metres. Taken as a whole, cases of larceny increased from 41,045 in 1929 to 51,477 in 1935.

Under the heading "breaking and entering" (which includes burglary, house-breaking, etc.), the most frequent offence is shop-breaking—which accounts for more than half of the total number of cases. Nearly three-quarters of the persons found guilty of "breaking and entering" were under 21. The total number of persons found guilty more than doubled between 1929 and 1935.

Frauds and false pretences were slightly up on 1929, but showed a decline from the level reached in 1932. Of the 4,958 offenders, 2,147 were guilty of "obtaining by false pretences"; 839 were persons under 21.

Sexual offences were slightly higher than in 1929, and 20% of the offenders were under 17. Roughly, half of the total number of cases related to indecent assault.

Cases of violence against the person (including murder, attempts and threats to murder, infanticide, manslaughter, wounding, and other serious offences of violence) show a marked increase since 1929. Of 1,397 offenders, 1,139 were found guilty of "wounding," and 947 of these cases of "wounding" were dealt with summarily. One hundred and one murders (exclusive of infanticides) were reported to the police; in 50 of these cases the murderer—or suspect—committed suicide; in 49 cases arrests of 47 persons were made, and in the remaining 2 cases the murderer escaped. Of the arrested persons, 9 were acquitted, 20 were found to be insane, 1 died while on remand, and 17 were sentenced to death; of these, 8 were executed, the sentences of 7 were commuted to penal servitude, 1 was respited and sent to the Broadmoor lunatic asylum, and in the remaining case the conviction was quashed on appeal.

Finally, the number of suicides and attempted suicides, after steadily climbing from 3,715 in 1921 to 5,657 in 1932, has at last begun to show signs of a check, the number for 1935 being 5,223, of which 32.5% were women. A similar state of affairs is shown in regard to the number of attempted suicides known to the police.

With regard to non-indictable offences, 57% of these were accounted for by infringement of the traffic laws, of which 78.5% related to motor vehicles and 16.7% to pedal cycles. Cases of obstruction with cars and motor-cycles amounted to 50,103 out of a total of 432,816, while traffic offences as a whole increased by 30% between 1934 and 1935.

The figures for non-indictable assaults show a decline, but offences by prostitutes are increasing, and more than doubled between the years 1931 and 1935.

In 1936, the number of persons found guilty of drunkenness amounted to 44,525, as compared with 42,159 in 1935 and the astonishingly low level of 30,146 in 1932. From 1920 to 1932 there was a steady decline in offences of this kind, but there has been a steady increase since. Offences against the Education Acts are steadily declining, the drop between 1931 and 1935 being from 7,318 to 4,768. Those against the Bankruptcy Acts increased from 105 in 1934 to 178 in 1935. (VI. BR.)

**Cripples, Care of:** see SOCIAL SERVICE.

**Cripps, Sir (Richard) Stafford** (1889– ), British politician and lawyer, is the youngest son of Lord Parmoor. Educated at Winchester and University college, London, he was called to the bar in 1913, becoming a King's counsel in 1927. He first entered parliament in 1931 as Labour member for East Bristol (which division he still represents), having been appointed solicitor-general in Ramsay MacDonald's government. Resigning with the other Labour ministers when the National government was formed in 1931, Sir Stafford became one of the leaders of the much diminished opposition. Controversy soon broke out between him and his colleagues, for he expounded more advanced views than those of other leaders, attacked the monarchy, and made himself the champion of the "united front" with the communist party and other dissident socialist bodies. These disputes continued until the autumn of 1937, when the annual conference of the Labour party, while emphatically rejecting co-operation with the communists, consented to changes in the party constitution, and elected Sir Stafford and his two associates, William Mellor and Professor Laski, to the executive, Sir Stafford announcing that he would relinquish his public campaign for the "united front." Sir Stafford has written much on socialism, and is the editor of two legal text-books.

**Croisset, Francis de** (1885–1937), Franco-Belgian dramatist born in Brussels, Jan. 28, 1885; died at Neuilly, Paris, Nov. 8, 1937. Croisset was his legally adopted pseudonym, his family name being Wiener, and his grandfather the Belgian engraver, Jacques Wiener. After graduating in law at Brussels university, Croisset pursued a literary career in Paris. His plays, which earned him a high reputation include *Chérubin* (1901); *Le Paon* (1904); *Le Bonheur* and *Mesdames* (1905); *Paris-New York* (1907); *Arsène Lupin* (1905, with M. Leblanc); and a number of plays written in collaboration with Robert de Flers, such as *Le Retour* and *Les Vignes du Seigneur*. Croisset's non-dramatic work includes *La Féerie Cinghalaise*; *Nos Marionnettes*; *La Vie Parisienne au Théâtre*; *Nous avons fait un Beau Voyage*. Croisset was a liaison officer between the French and British armies during the war. He was decorated with the Legion of Honour and the Croix de Guerre.

# CROP CONTROL—CROQUET AND ROQUE

**Crop Control.** More intensified activity toward governmental control of agricultural production marked 1937. This movement, seemingly of little formidable significance before 1929, has grown rapidly ever since, not only in the three deficit, totalitarian States, Germany, Italy and Japan, but also in the other two principal countries deficient in food and raw products, the United Kingdom and France.

**United States.**—The Government's "Ever Normal Granary" project was given to Congress in 1937 to evolve laws, probably early in 1938, to establish quotas for production and carryover in order that surpluses and shortages might be avoided and a balance established between lean and fat years. Loans were granted growers on corn and cotton, soil conservation practices were encouraged and retirement of submarginal lands and resettlement carried on.

**Germany.**—Probably outstanding in the extension of Government authority in agriculture in 1937 was Germany where the kind of feed for livestock was fixed by decree, farmers were compelled to surrender all wheat and rye in excess of household and seed requirements, and to encourage early delivery the Government scaled prices so that farmers were penalized for holding back grain. The Government also established annual quotas for all grains to be produced by each farm, with a minimum of bread grains, to prevent farmers from planting only feed grains which are not required to be surrendered. The Reich's efforts toward a self-sufficiency goal also decreed that no land must be idle. All farming is supervised, certain crops rigidly restricted and others encouraged by price fixing, subsidies, loans and tariffs.

**United Kingdom.**—The Government subsidy for home-grown beef and veal, amounting to 5s. per cwt. (9s.4d. dressed weight) was changed slightly to afford a premium on extra prime cattle and a lower subsidy on fairly good grades. No substantial changes, however, were made in foreign import quotas, tariffs, including duty-free preferences for Empire countries, subsidies and marketing organizations which have fostered agricultural production in the United Kingdom during the last seven years.

**France.**—Farmers were granted credit relief in 1937 by a decree deferring payment of certain debts two years. The tendency now is more toward social than economic measures, since Government intervention in previous years established import quotas, tariffs, subsidies, market control and price fixing for the protection of French agriculture on which about 48% of the population is dependent, in contrast with the United Kingdom where only about 7% is engaged in agriculture.

**Italy.**—No marked changes were made in 1937 in policies by which the Italian Government seeks self-sufficiency in agriculture, by tariffs, price fixing and subsidies. It is interesting to note that Italian per capita wheat consumption declined from 7.8bu. in 1925 to 6.5 in 1937 and in that period Italian consumers paid a premium estimated at \$2,800,000,000 on wheat.

**Japan.**—Government encouragement has increased Japanese rice production to 85% of consumer needs but no material changes developed in 1937 affecting the problems of heavy farm debt and taxation and tenancy, factors causing agricultural depression while industrial development was growing rapidly.

For regulation of other crops (see SUGAR, and COFFEE); (see also AGRICULTURE). (S. O. R.)

**Crop Insurance.** Recommendations that crop insurance in the United States be applied, at the outset, to wheat only were made by a special committee appointed by President Roosevelt. The proposed plan calls for insurance of a maximum of 75% of a harvest by a wheat grower, such insurance to be paid the grower in actual wheat. Thus, if the average acre yield of a farm were 16 bushels, insurance would guaran-

"THE MAN WITH THE HOE." A modern version of the menacing sword of Damocles, depicted by York in the *Louisville Times*, as Congress senses organized agriculture's urge for farm legislation

tee that the grower received 75% of that yield, or 12 bushels. If the grower raised less than 12 bushels, the insurance would make up the difference. In this way the plan avoids the hazard of attempting to assure the grower an income, or any price for his grain, a procedure that is considered impractical. Premiums paid by growers would be based on crop-loss experiences on each farm, and generally would run under 10%, although in the Dust Bowl area they would run higher. The government would accept wheat for premiums and would buy wheat with cash premiums, the grain so acquired to be stored and held from year to year to provide stabilization between lean and fat years. Insurance by farmers would be entirely optional, unlike certain European systems where it is compulsory. (S. O. R.)

**Croquet and Roque.** English croquet players defeated a visiting Australian team in a series of five "test" matches for the MacRobertson trophy, the gift of Sir MacPherson Robertson, K.B.E. The open championship was won by C. F. Coleman, who defeated Miss D. D. Steel, former croquet champion in England.

Miss Steel won the ladies' championship, the ladies' gold medal and the president's cup. Other principal matches were won as follows:

Men's championship, J. A. McMordie. Men's doubles, Lord Tollemache and Sir Gerald Burke. Men's gold medal, J. A. McMordie. Irish championship, J. C. Windsor. Ladies' field cup, Mrs. B. C. Apps. Mixed doubles, M. B. Reckitt and Mrs. B. C. Apps. Inter-county championship, won by Middlesex.

Croquet in the U.S. maintains apparently only a local interest. Records of the Amateur Athletic Union of the U.S. disclose no championship matches. One of the most active croquet organizations is the Circle Croquet and Roque club of New York city. Members of this club are said to have played on the club grounds, regardless of weather, almost every day for the last thirty years

**Crozier, Frank Percy** (1879–1937), C.B., C.M.G., D.S.O., British soldier; born Jan. 9, 1879; died at Walton-on-Thames, Surrey, Aug. 31, 1937. He was educated at Wellington, and, after having had, for reasons of health, to abandon the prospect of a military career, took the opportunity of the South African war to enlist in Thorneycroft's mounted infantry. During the course of that war he obtained a commission in the Manchester regiment. He continued to serve in Africa until 1905, but bad health led him to resign his commission in 1909. In the World War he went to France as major with the 9th Royal Irish Rifles, of which he took command in Jan. 1916. In Nov. 1916, he was promoted brigadier-general commanding the 119th Brigade, and from March to April 1919 commanded the 40th Division. From the autumn 1919 until March 1920 he was inspector-general and military adviser to the Lithuanian army. His D.S.O. was won in 1917, and his C.M.G. and C.B. followed in 1918 and 1919. In 1921, following his pacifist activities, which, from the disciplinary point of view, were questionable, he resigned. General Crozier married, 1904, Ethel Colb (*d.* 1921), and second, 1921, Grace Catherine Croker Roberts. There were two daughters by the former marriage. General Crozier's publications include: *A Brass Hat in No Man's Land* (1930); *Impressions and Recollections* (1930); *Five Years' Hard* (1932); *Angels on Horseback* (1932); and *The Men I Killed*, which aroused considerable controversial discussion.

**Crude Oil:** see PETROLEUM.

**Cruisers:** see LONDON NAVAL CONFERENCES; NAVIES OF THE WORLD; REARMAMENT.

**Cuba,** a republic occupying the largest of the West Indian islands; language, Spanish; capital, Havana; president, Federico Laredo Bru; area, 41,634 sq.mi. without small neighbouring islands. Population (census, 1931) 3,962,344; (estimate, 1936) 4,108,650, including about 68% whites. The chief cities (1930) were: Havana, 542,522; Santiago, 103,525; Cienfuegos, 87,669. The United States has a leased naval base at Guantánamo.

**History.**—The year 1937 in Cuba was featured by more open military domination of government, increased sentiment against foreign business, and an extensive "Three-Year Plan" for the nationalization of industry. Since 1933 the dominant political figure had been the "Cuban Warwick," Colonel Fulgencio Batista, chief of the Constitutional Army of Cuba. In the closing days of 1936, refusal of President Mariano Miguel Gómez to approve a Batista-inspired law which placed rural education under control of the army brought about President Gómez's impeachment and removal from office (Dec. 23, 1936). Vice-president Federico Laredo Bru then assumed the presidency. The first months of 1937 saw the elimination of Gómez partisans from official positions, with important changes in the presidency of the House of Representatives and in the diplomatic representation at Washington. While these changes were being effected, Cuban progress was almost at a standstill; but in the rest of the year, significant accomplishments were recorded, including plans for the amortization of the Machado public works debt, a favourable commercial treaty with Great Britain, and, most significant of all, the beginning of a "Three-Year Plan" for economic and social reconstruction, announced in July by Colonel Batista. In presenting this program Batista cast aside all pretence of military non-intervention in civil affairs.

Continued efforts were made by the Government to improve the status of labour and industry at the expense of foreign enterprise. Previous law had required that a minimum of 50% of the payroll in each establishment go to Cuban nationals. In May, this was raised to 60% by legislative enactment. Foreign con-

cerns protested bitterly against this law, which made it difficult to obtain adequate high technical personnel, as well as against a Labour Department policy of refusing labour permits to foreigners if Cubans were available for the work, and the further requirement that, for each foreign technician employed, one Cuban apprentice be hired.

The signing of a commercial treaty with Great Britain (Feb. 19), which granted that country's nationals special exemptions from labour laws and most-favoured nation status (except against the United States), precipitated sharp criticisms from United States business firms. By this treaty, Cuba gained most-favoured nation status in British markets (except against the British Empire). Opponents of the Government likewise took the occasion to criticize the treaty as an invasion of the legislative prerogative.

A further significant labour development was the deportation of Haitian, Jamaican, and other West Indian labourers in February and March. This caused protests from Jamaica, while return of Haitians to Haiti had serious effects there (*see* HAITI; DOMINICAN REPUBLIC).

Of great importance to Cuban national credit was the decision of the Supreme Court, June 2, in regard to \$60,000,000 in loans made by the Machado dictatorship and held chiefly in the United States. These had been repudiated in 1934, on the grounds of unconstitutionality, but the Supreme Court held them to be legal obligations. In December, a plan was tentatively agreed upon for new bonds to replace the old.

In July, Batista announced a vast social and economic reorganization program embodying most of the reforms advocated during the previous thirty years. With this Batista and the army emerged as the main power of Cuba. Previously, the army had obtained control of schools, built roads and hospitals, and intervened in congressional politics. The Three-Year Plan was a culmination of this activity. Embracing a twenty-point legislative program regimenting almost every phase of national life, it called for governmental reorganization and regulation of the sugar and tobacco industries; reform of banking and currency and of the tax system; increasingly nationalistic labour legislation; reforestation and water supply development; distribution of State lands; consumers' and marketing co-operatives; regulation of mining and oil production; judicial reform; creation of a merchant marine; a vast health and education program; and "nationalization" of property rights.

Announcement of the Batista plan caused great confusion and bewilderment. Congress was plunged into turmoil; business was so alarmed that within a few weeks over \$30,000,000 was shipped abroad. The general public, believing the plan too grandiose to be financed by the Government, was apathetic. Nevertheless, before the end of the year, considerable progress was made on several proposals. A banking mission went to the United States to study the banking and credit system of that country with a view to developing a Cuban-controlled banking system to replace the present foreign-controlled institutions. Co-ordination of the sugar industry was attempted by a law enacted in August, granting sugar-growers a five-year debt moratorium and providing for agricultural credits. In December an act was passed providing for distribution of State lands to tenant farmers, and some 33,000 acres were ordered parcelled out immediately.

When Congress re-convened, Nov. 1, after a six-weeks recess, President Laredo Bru recommended rapid action on banking reorganization, as well as suggesting further tightening of labour legislation to give greater protection to working classes.

Probably of greater concern to Congress than the details of the Three-Year Plan was the task of providing machinery for the elections of March 5, 1938, for renewal of half the seats in the House

Glasgow. The Liverpool club in 1937 won the Newall Cup in League competition with seven other English clubs, and also the Meggal Memorial Competition. The I'Anson Cup, which carries the championship, was won by J. E. Cowper, skip of the Manchester Caledonians, this being the eleventh time he has skipped the winning rink.

(S. O. R.)

**Currency:** see EXCHANGE RATES.

**Cycling.** Of outstanding importance were the two New York performances of the international six-day races, the first held in the spring and won by the team of Jean Aerts and Omer Debruycker of Belgium, the second staged in the early winter and captured by the German combination of Gustav Kilian and Heinx Vopel. As usual these sustained grinds, the sixty-second and sixty-third respectively, attracted the leading pedallers of the world with teams from England, France, Germany, Belgium and Italy entered. The thirty-first Tour de France race was won by Roger Lapébie of France, who covered the 2,775-mile circle around that country in 26 days, with 98 of Europe's blue ribbon cyclists participating. Italy's entrants were second, Germany's third, followed by Switzerland's, Spain's and Luxemburg's in that order. The Belgian riders, who were virtually sure of winning, withdrew from the race at Bordeaux because, they said, the spectators threw stones and pepper at them. In England, the team of Piet van Kempen of the Netherlands and Henri Buysse of Belgium won London's six-day race. The Isle of Man bicycle race was captured by J. Fancourt, who covered two laps of the difficult course in 3:28:43.6 for an average speed of nearly 22 miles an hour.

The national amateur cycling championships of the United States were held at Buffalo, New York. The three top honours were won by Charles Bergna, Furman Kugler and Miss Doris Kopsky, representing New Jersey, sweeping the junior events, the national senior road title and the women's national championships. Angelo De Bacco of the Belleville B.C. (Belleville, N.J.) defeated a field of 120 cyclists to win the fifth annual Eastern U.S. road championship over a 50-mile course. The winning time was 2:12:08.4. The American dirt-track title was won by Buster Logan of Newark, N.J., who subsequently also captured the national quarter-mile championship for amateurs. Benny Kaufman of New York was the victor in the national speedway motorcycle racing championship of the American Motorcycle Association. Joe Petrali of Milwaukee, Wis., made the highest speed ever attained by man on two wheels by driving his motorcycle at 136.18 miles an hour at Daytona Beach, Fla.

General interest in cycling became so great both in Europe and the United States that thousands of persons purchased bicycles and made vacation trips on them. Railroad companies ran special trains out of the crowded cities to rural sections where passengers were able to rent a bicycle and ride for the day. (T. J. D.)

**Cyprus,** one of the largest islands in the Mediterranean, 60 mi. from Syria and 40 mi. from Asia Minor; British Crown colony, area, 3,584 sq.mi.; population (1931 census) 347,959. The year has been one of increased prosperity and there has been a steady decline in death-rate and infant mortality combined with an increase in the birth-rate. Thanks to favourable weather conditions and continued satisfactory world prices, trade figures have been appreciably higher. During the nine months ending Sept. 30, 1937, imports amounted to £1,601,201, and exports to £1,483,301, being respectively £577,386 and £429,468 more than during the corresponding period of 1936. Conspicuous among the exports were mining products, particularly asbestos, copper ore, and pyrites. The mining industries of the island are assuming great importance, and the development of its mineral resources is destined

to play a great part in its economic future. Public finances were good. Revenue for the year was approximately £100,000 above the estimates, and there will be an estimated surplus of £116,000, which will bring the reserve to £456,000.

**Czechoslovakia,** a republic of central Europe and member of the League of Nations. Bounded W. by Germany, N. by Poland, E. by Rumania, S. by Hungary and Austria. President, Dr. E. Beneš. Flag, blue, white and red.

**Area and Population.**—The area is 54,244 sq.mi. Population: 1936, 15,187,000; 1934, 14,729,536, of whom 9,688,770 were Czechoslovaks (about 7,300,000 Czechs and 2,300,000 Slovaks), 3,231,688 Germans, 691,923 Magyars, 549,169 Ruthenes, Russians and Ukrainians, 186,642 Jews (by nationality), 81,737 Poles and 49,636 others. There were 249,971 persons not Czechoslovak citizens. The Czechs inhabit chiefly the centres of Bohemia and Moravia; the Slovaks, north and central Slovakia; the Germans the west and north of Bohemia, and north Moravia, forming about one-third of the populations of Bohemia and Moravia; the Magyars, along the southern fringe of Slovakia; the Ruthenes, Carpathian-Ruthenia; the Poles, Silesia. In 1930 10,831,696 persons were Roman Catholics; 585,041 Greek and Armenian Catholics (nearly all Ruthenes); 1,129,758 Protestants; 145,598 Orthodox (Ruthenes); 356,830 Jews.

The chief towns with populations (1930) are: Praha (Prague), 848,823; Brno (Brünn), 264,925; Moravská Ostrava (Mährisch-Ostrau), 125,347; Bratislava (Pressburg, Pozsony), 123,892; Plzeň (Pilsen), 114,704; Košice (Kaschau, Kassa), 70,232; Olomouc (Olmütz), 66,440.

**History.**—The Government in 1937 was in the hands of a coalition, in which the Agrarians were the strongest party. The premier was Dr. M. Hodža, a Slovak. The Government resigned on July 16, owing to the refusal of the finance minister to sanction a Government subsidy on cereals, but was reconstructed in identical form, except for the finance minister. Internal politics as among the Czechs, and between the Czechs and Slovaks and Ruthenes (who were allowed to advance a short step along the road towards their promised autonomy), were quiet.

Interest centred on relations with the national minorities, and especially the Germans, two-thirds of whom belonged to the intransigent party of Herr Henlein, who enjoyed the open sympathy of the German Reich. On Feb. 20, the Government, which had invited the "activist" German parties (Agrarians, Social Democrats, and Clericals) to submit their wishes, announced agreement with those parties on five points:

(1) State capital expenditure and Government assistance should be distributed according to regional needs. Particular care should be taken to make use of German *entrepreneurs* and workmen in the German districts.

(2) Government subsidies for social welfare and health to be distributed, not only on the basis of population, but also of unemployment.

(3) Subject to the *sine qua non* of loyalty to the State, the Government would apply the principle of equitable proportion in appointment to State, etc., posts.

(4) Communications to communes, where an overwhelming proportion of the population speaks a minority language, to be accompanied by translations in that language.

(5) Educational concessions, in which the Poles and Magyars, as well as the Germans, should benefit.

Two demands were refused, as requiring amendment of the constitution; the creation of parliamentary commissions for minority questions, and the use of minority languages in parliament.

The "activists" were prepared to accept these concessions, and most of the Czechoslovak parties agreed to grant them. They

CZECHOSLOVAKIA: Industrial production index (1928=100) (*The Annalist*)

were attacked by the Czechoslovak nationalists, and still more by Herr Henlein's party, and by the Reich press, as insufficient in themselves and unaccompanied by any legislative guarantees. Herr Henlein pressed, among other things, for "Völkische" autonomy. Nevertheless, relations between the Government and the minorities certainly improved. There were two "incidents" which led to angry exchanges with Germany, and with the Henlein Party. On June 17 a German citizen of Czechoslovakia was alleged to have been maltreated in prison, and on October 17 some deputies of the Henlein Party were arrested and roughly handled. On the latter occasion feeling ran so high that the Government postponed holding the local elections, and prohibited public meetings throughout the country. On Oct. 8 two leading members of the Henlein Party were arrested on a criminal charge; one committed suicide in his cell.

The Government pinned its foreign policy to the Little Entente and to France. Much satisfaction was given by an assurance from M. Blum, in May, that France would stand by Czechoslovakia if attacked, and by M. Delbos' visit in December. Repeated assurances were given that the Czecho-Soviet Pact concealed no dark mysteries. A ludicrous incident occurred on Aug. 19, when Portugal broke off diplomatic relations owing to a squabble over a munitions contract.

Dr. Masaryk (*q.v.*), founder and first president of the state, died on Sept. 14, aged 87. Dr. Karel Kramář (*q.v.*), another great figure of earlier days, also died.

**Trade, Communications, and Finance.**—The monetary unit is the Czech crown, originally equal to 2.963 gold cents. This was devalued on Feb. 17, 1934, and again on Oct. 9, 1936, making a total devaluation of 30%. The finances are stable. Budget estimates for the last five years, in millions of crowns, follow:

	1933	1934	1935	1936	1937
Revenue . . . . .	8,634	7,632	7,985	8,034	8,456
Expenditure . . . .	8,633	7,631	7,983	8,032	8,454

In both national and party interests, the country is making a determined drive towards autarchy, this being the main cause of the persistent failure to reach a comprehensive trade agreement with Hungary. The Agrarians and Socialists have succeeded remarkably well in reconciling the conflict between producers' and consumers' interests in agriculture. Unemployment in industry has, however, been very heavy, particularly among industries working for export, which are largely situated in the German areas. The registered unemployed exceeded 860,000 in Feb. 1936 and still numbered over 500,000 in April 1937. The index of

employment (1929=100) ranged from 69.2 to 89.2 in 1936. In March 1937 it was 79.8. The index of industrial activities in 1936 was 91 (av. 1925-29=100).

**Defence.**—Military service is universal and compulsory. The average daily effectives (1937) were 10,221 officers and 178,448 other ranks (army and air force). A law providing for the pre- and post-military service of the whole population of both sexes, between the ages of 6 and 50, was passed on June 25, 1937. In 1936 a law had been enacted investing the Government with very wide powers for industrial mobilization for national defence, and establishing a very strict régime in the frontier districts. A decree was also issued providing for the formation of a force of frontier guards organized on military lines. (*See also* **LITTLE ENTENTE**; **MINORITIES**.)

**Dahomey:** *see* **FRENCH WEST AFRICA AND THE SAHARA**.

**Dairying.** Milk provides one-fifth of the American farm income. The source of this wealth in 1937 was 24,902,000 cows and heifers more than two years old on U.S. farms and kept for milking purposes. This number was 89,000, or about 0.4%, less than the number of milk cows in 1936 and about 2,000,000 under the record high of 1934. Value per head of the milking herds in 1937 was \$54.45, or about \$4.06 higher than the preceding year. The number of U.S. dairy farms is approximately 605,000, but on 4,000,000 other farms there is an average of four milk cows each. Dairying is the largest farm industry in the United States. The 1937 production of milk was estimated by the U.S. Department of Agriculture at slightly more than 103,000,000,000 pounds. This is about the same as in 1936, but two per cent larger than 1934 or 1935 and 1,500,000,000lbs. less than the record high production of 1933. The average milk production per cow for 1937 was 4,358lbs., about one per cent over 1936 and the highest since 1931. For each 100lbs. of milk produced 41% was utilized as fluid milk, 44% went to the manufacture of butter, 6% to the manufacture of cheese, 4% was canned as evaporated or condensed milk or cream and 3% was used in the manufacture of ice cream, and a still smaller quantity was used in the manufacture of various milk products such as malted milk. Milk production in 1937 was low the first four months owing to scarcity and high cost of feed, but abundant pastures and crops later provided favourable conditions for dairy operations. Tuberculosis in U.S. dairy herds, the U.S. Department of Agriculture announced in 1937, had reached practically a vanishing point, as virtually all the cattle in 46 States had been tested and the herds in the remaining two states would soon be accredited also. The scope of the undertaking to eradicate bovine tuberculosis may be better appreciated when it is known that New York was admitted to the list of accredited states only as recently as October 1937, and that it required 18 years of effort, the slaughter of 965,000 animals and a cost of \$57,000,000 to rid the state's herds of infection. Of the dairy animals reacting unfavourably to tuberculin tests in 46 states about one-fourth of the number were in New York.

Milk is now marketed by truck to a large extent in the U.S., and many cities, among them Buffalo, Cleveland, Minneapolis, St. Paul, Kansas City, Columbus, Louisville, Dayton, Richmond and Kansas City, receive all their milk by truck. Boston receives 90% of its milk by train and New York, 65%. Some cities, however, require by ordinance that milk be produced within 50mi. of the city, to insure freshness. The dairy industry is greatly concerned over the lack of standardized transportation charges, the

A DAIRY HERD at Warragul, Australia

University of Illinois having found, as one example, that 15 truck routes hauling milk about 12mi. had freight rates varying from 13 to 30 cents a hundredweight.

The 11th convention of the World's Dairy Congress was held in Berlin, Germany, August 22-28, 1937, at which time the International Dairy Exposition was also held. The Congress is sponsored by the International Dairy Federation and meets every three years. (See BUTTER: Milk.) (S. O. R.)

**Great Britain.**—During 1937 the general conditions affecting dairy farming in Britain were favourable. The summer pastures benefited by alternate periods of medium rainfall and sunshine and a satisfactory level of milk production was maintained. Good crops of hay and average crops of roots were obtained for winter use and, because of an all-round rise in the price of purchased feeding-stuffs, these home-grown products assumed greater importance than usual after the grazing season ended.

The number of dairy cattle declined very slightly during the year, most probably due to a small proportion of farmers reverting to beef production. The number of cattle under milking age showed a definite increase. There was also evidence of a slight decline in milk production in the latter half of the year, due in part to the decrease in the number of cows and in part to the higher cost of feeding-stuffs and labour. In some parts of the country, the difficulty of obtaining competent labour for dairy farms has become acute.

The schemes in operation for improving the hygienic standard of milk production and combating disease in dairy herds have made good progress. The number of herds producing "accredited" and "tuberculin tested" milk under the Milk (special designations) Order, 1936 have steadily increased. The revision of the attested herds scheme of the Ministry of Agriculture, for the recognition of herds free from tuberculosis, has created widespread interest, and the financial assistance now obtainable is encouraging many farmers to free their herds from this disease. Marked progress has been made in areas in Scotland and Wales where the herds are maintained entirely by home-bred stock. Towards the end of the year, serious outbreaks of foot-and-mouth disease

caused the closing of markets, restriction of movement of stock, and the slaughter of a number of herds. The official scheme of milk recording has been reconsidered with a view to improvement, in order that the percentage of recorded herds in the country might be increased.

In the Dominions, the wide differences in climatic conditions have naturally influenced dairy farming. In New Zealand, where a phenomenally wet summer was experienced, there was a plentiful supply of pasture even in the dry districts, but the making of good hay was difficult, and many hay crops were converted into silage. There was a slight decrease in the number of cows, but the average yield of butter fat per cow was increased, and there was also a slight increase in the total production of milk. In Australia, dairy farming is developed most fully in Queensland and Victoria. The number of cows is just over 3,000,000, or approximately 23% of the total stock of cattle. Milk production has increased with better weather conditions following periods of severe drought. South Africa experienced a season of extremes of rainfall and drought resulting in a record production of milk early in the year, followed by a rapid fall to a low level. A cattle improvement scheme has been introduced by the Department of Agriculture to assist farmers to keep better bulls. There is also definite evidence that a larger proportion of the milk produced is being required to meet an increased demand for liquid milk. In Canada, the conditions have approximated to the average in the eastern provinces (Ontario and Quebec) where dairy farming is mainly practised. The number of cows is about 4,000,000, equal to 43% of the total head of cattle. (See also BUTTER; CHEESE; MARKETING BOARDS; MILK.) (J. M.H.)

**Dakar:** see FRENCH WEST AFRICA AND THE SAHARA.

**Dalen, Gustaf** (1869-1937), Swedish inventor who received the Nobel prize in physics in 1912 and who was most widely known for his invention of the automatic valve lighting unmanned beacons at sunset, died at Stockholm, Dec. 9, 1937. An account of his life appears in the *Encyclopædia Britannica*, vol. 6, p. 987.

EXCAVATING CREWS worked two years removing 18,000,000 cubic yards of stone and earth from the United States' largest dam site, the Grand Coulee on the Columbia river.

**Dalziel, John Sanderson** (1839–1937), American wood engraver, was born in Edinburgh, Dec. 24, 1839. Before coming to the United States in 1869, he made engravings for Charles Dickens, *Punch* and the *London Courier*. The quality of his work was immediately recognized in the new world where his engravings of American birds became particularly prized.

He died in Denver, Aug. 18, 1937.

**Damrosch, Frank Heino** (1859–1937), American musician who founded the Institute of Musical Art in New York city; died in New York on Oct. 22, 1937. References to his musical work as well as that of his father and brother may be found in the *Encyclopædia Britannica*, vol. 7, p. 8.

**Dams.** Record-breaking projects in the fields of irrigation, power, flood control and navigation have brought dams to the fore in today's construction budgets.

In the United States, on the Columbia river, concrete pours into the forms at Grand Coulee at the rate of over 12,000 yd. per day. The low dam is nearing completion and the contract is signed for the remaining 300 ft. in height which will make it the largest concrete dam in the world. Two major difficulties harassed the contractor in the course of the year; one, a 200,000 cu. yd. landslide that threatened to engulf his excavation with a lava-like flow of mud; and, two, a cofferdam leak of 30,000 gals. per minute. By the German method of freezing, with some six miles of brine-carrying pipe, an arch dam of frozen mud was built to successfully halt the slide. Bentonite and a fill outside the cofferdam stopped the leak, narrowly averting disaster. Lower down on the river Bonneville has been completed and will be delivering power early in 1938.

Here are located the much-debated, yet untried fishways designed to enable the salmon to get past the dam to and from the spawning grounds and thus preserve the river's \$10,000,000 a year salmon industry.

Good progress has been made on Fort Peck on the Missouri river, the world's largest dam. Pending the driving of four concrete-lined diversion tunnels, 25 ft. in diameter and 6,000 ft. long, the work has proceeded in two sections, one on either side of the river. On June 24 the river was diverted through the completed tunnels, and work on the closure section commenced. On a tributary of the Missouri, the North Platte, Kingsley dam was begun. It will be second only to Fort Peck in volume. Another

EIGHT-TON BUCKETS dump concrete in five-foot layers to form the Grand Coulee Dam in Central Washington

record-breaker is the San Gabriel No. 1 dam, the highest of its type in the world, completed in July 1937.

A world's record for dams of this type was believed to have been set in May when 964,556 cu. yds. of fill were placed during the month. Below Boulder dam on the Colorado river, Parker dam, unique in its unprecedented depth of excavation to bed-rock, saw that difficult task accomplished this year. Of the 320 ft. height of this dam 235 ft. will be beneath the stream-bed. Over 50% of the concrete is now in place.

The Shingmun dam at Hongkong, highest in the British Empire, was completed early in 1937. Earthquake danger, high cost of concrete material, and cheap labour dictated this unique hand-laid rockfill. It consists of an impermeable upstream panel mounted on a heavy thrust block backed up by the rockfill with a thin wedge of sand in between to equalize the pressure as the rockfill settles.

Four dams in Algeria are notable for their impermeable upstream faces and extensive drainage systems. Here, too, the rockfill was laid by hand or machine rather than dumped loose, in an effort to build according to a rational design worked out from experimental and theoretical investigation.

Data on other important dams will be found in the accompanying table. (See also MISSISSIPPI RIVER SYSTEM.) (W. P. C.)

**Dancing.** In the ballroom, "swing" music has exercised a considerable amount of influence, and in England the Imperial Society of Teachers of Dancing has attempted to arrange a routine of steps to fit it. In the United States, where swing originated, dance movements with a decided hop effect have shown a tendency to become popular, especially among the college boys and younger folk. Such movements have many curious names, but collectively they are known as "shag."

In the autumn a curious dance known as the "Big Apple" and its "refinement" the "Suzy-Q" arrived in New York. It came from Columbia, South Carolina, where a small abandoned synagogue had been converted into a night-club called "The Big Apple." It is danced in a circle by a number of couples and a caller, who nominates the steps to be performed. These are mostly of a shag, Charleston, or "truckin'" nature, and are generally a little eccentric, particularly when a solitary couple is called to the centre to "shine," that is, to show off and execute the strangest steps they can.

In England the quick or old time waltz has been very much in evidence in the West End, but the rumba, which is still in favour in the United States and in France, has made very little headway. In the English popular ballrooms, where dancing is taken more seriously, there has been a great revival of interest in competitions in the four standard dances—waltz, slow fox trot, quick step, and tango—and the British championships (professional winners—Adela Roscoe and Cyril Farmer; amateur—Renée Sissons and John Wells) were again broadcast. Competitions on a large scale have been held in Germany at which representatives of many nations competed. The English amateur champions won the more important of these. In February in Copenhagen, a team of English amateurs just managed to defeat a team of Danish amateurs—Herr Max Wendt of Hamburg being the sole adjudicator.

In Paris, the Conga was revived and met with a certain amount of popularity.

In England, formation dancing has attracted some attention, and numerous teams have been formed throughout the country. Denmark and Germany are also interested.

In the autumn, the university extension committee of the University of London organized a series of six lectures dealing with the history, meaning, and influence of the dance, which were delivered in the senate house.

During 1937, the Royal Academy of Dancing, which had been given a charter early in 1936, sent examiners to South Africa and also to Australia and New Zealand. About 7,000 candidates took the academy's children's examinations during the year.

The English Folk Dance and Song Society celebrated its silver jubilee year with its usual dance festival at the Royal Albert hall in January, and in June was responsible for a massed folk dance display by nearly 1,400 dancers, at the Festival of Youth at Wembley. (See also **BALLET**.) (P. J. S. R.)

**Danish Literature:** see **SCANDINAVIAN LITERATURE**.

**Danube, Control of.** This was vested after the War in two bodies: the European Commission, controlling the mouth, and composed, since the War, of representatives of France, Great Britain, Italy, and Rumania; and the International Commission, established in 1921 with seat in Bratislava (since 1927, in Vienna). This was intended to control the Danube from the limits of the European Commission's jurisdiction up to the highest navigable point, Ulm. All the riparian states, with France, Britain, and Italy, were represented. On Nov. 14, 1936, Germany resigned from this commission and refused to recognize its competence in German waters, alleging

**DANCERS SHOUT, "Praise Allah."** A figure in the Big Apple, the dance discovered in a Columbia, S. C., Negro dance hall by University of South Carolina students

that it constituted an "inequality" against her, and also that her efforts to be reinstated on the European Commission, whence she had been dislodged under the Treaty of Versailles, had been unsuccessful. (C. A. M.)

**Danzig,** an important port on the Vistula river near the Baltic sea, was taken from Germany after the World War and created a free city—sovereign in some respects, controlled by Poland in others, and supervised by a high commissioner ap-

**"SWING HIGH, SWING LOW,"** a movement in the noisy, romping Big Apple, a dance that has spread over the United States and to Europe

pointed by the League of Nations. Its area is 754 sq.mi. and its population 407,000, of whom 291,000 live in Danzig itself, the remainder in the surrounding rural districts. As Danzig had been under the Teutonic Knights from 1308 to 1454, under Poland from 1454 to 1793, and a part of Prussia from 1793 to 1919, it was furiously coveted by both Germany and Poland even after its establishment as a free city. Centuries-long emotional hatreds caused bitter German-Polish friction and constant appeals to the League of Nations for fifteen years after its separation from Germany.

With Hitler's coming into power in Germany in 1933 the German-Polish friction decreased, but the conflict between the Nazis and the anti-Nazis in Danzig increased. Hitler's German-Polish ten-year treaty of friendship of Jan. 26, 1934, agreeing that neither country would use force against the other, and his German-Polish Minority Agreement of Nov. 5, 1937, guaranteeing equal treatment of minorities, greatly improved the relations between the two countries. Poland's new port of Gdynia, founded soon after the World War, connected by railway with Warsaw, and favoured with Polish capital and railway rates, grew with such mushroom rapidity that its volume of trade exceeded that of Danzig by 1933; in 1936 4,920 ships cleared at Gdynia and only 3,195 at Danzig. Poland's power of diverting trade to the rival port of Gdynia threatened economic disaster to the old Hanseatic city. The bitterness felt by the Danzigers because of this was somewhat lessened by the Danzig-Polish Harbour Agreement of Aug. 5, 1933, by which the two ports were to share equally in Poland's trade.

Hitler regards the Germans in Danzig as part of the German folk, and the Nazis there are organized under the aggressive Nazi district leader, Arnold Forster, as part of the German Nazi party. In 1933 the Danzig Nazis, aided from Germany, began to use the strong-arm methods of their party brethren in the Reich, employing Brown Shirts and the policy of co-ordination (*Gleichschaltung*) to get control of the Danzig Government. The high commissioner tried to protect the rights of liberals, Catholics, Jews, and Poles, but he fought a losing fight because the League of Nations was growing progressively weaker. Trade unions and opposition newspapers were suppressed, and opposition leaders were placed under "protective arrest." The Communist party was forbidden in May 1934, and the Social Democrats in Oct. 1936. Arthur Greiser, a radical Nazi who became president of the Danzig senate in Nov. 1933, was called to account by the League of Nations in Jan. 1936, but in the following June he came to Geneva and made a defiant speech demanding the end of League control. His dissolution of the Catholic Centre Party in Oct. 1937, finally gave the free city completely into the hands of the Nazis. See article DANZIG in *Encyclopaedia Britannica*; and Ian F. D. Morrow, *The Peace Settlement in the German-Polish Borderlands* (Oxford Univ. Press, 1936). (See NAZIS; LEAGUE OF NATIONS.) (S. B. F.)

**Dardanelles:** see TURKEY.

**Dartmouth College.** Significant developments during the year 1937 included curriculum changes and the solution of certain problems in the social life of the college.

During the year a new course in social science was inaugurated as a means of stimulating and interesting first-year students in modern social, economic, and political institutions. It is required of all freshmen. The purpose is to emphasize the interrelations between the subjects of history, economics, sociology and political science. To achieve this objective, the class is divided in small sections taught by a staff selected from each of the social science

departments. In the sophomore year men who do not expect to major in the social sciences are required to take a second year of integrated study of contemporary American institutions. Here again departmental boundaries are not recognized.

Following a two-year study of the social life of the college a committee submitted an exhaustive report to the president and made important recommendations, several of which have already been adopted by the trustees. A college adviser to fraternities has been appointed to assist the 22 fraternities in a program of revitalization.

The opening of Thayer hall in September provided the college with a solution of the eating problem for members of the three upper classes, accommodating about 700 in its cafeteria, colonial dining room, and rathskeller. The freshman class continue to eat in Commons also owned and operated by the college.

The enrolment has been limited to about 2,400 during recent years, there being 2,442 during the 1937-38 session.

(E. M. Hs.)

## Daughters of the American Revolution.

The national society, Daughters of the American Revolution, was formed to perpetuate the memory and spirit of the men and women who achieved American independence, by the acquisition and protection of historical spots and erection of monuments, by historical research in relation to the Revolution and publication of this data, by preservation of relics, documents, and records of individual services of Revolutionary soldiers and patriots, and by promotion of celebrations of patriotic anniversaries. Likewise, to carry out the injunction of Washington in his farewell address to the American people, "to promote, as an object of primary importance; institutions for the general diffusion of knowledge"; to cherish, maintain, and extend the institutions of American freedom, to foster true patriotism, and love of country, and to aid in securing for mankind all the blessings of liberty. It has a broad and varied program of education for all foreign and native born, to bring knowledge, understanding of fundamental principles upon which this nation was founded.

Since its organization in 1890 with 18 women, 325,000 have enrolled in 2,500 chapters in every State and in foreign countries. Work—historical, patriotic, educational—is carried on through 25 national committees, all working toward one goal, to preserve the nation's birthright and her ancient landmarks, to foster the cause of freedom, to make real the American dream of liberty, opportunity, justice and humanity, for all. (F. H. BE.)

**Davidsohn, Robert** (1853-1937), German historian; born at Danzig, April 26, 1853, of Jewish parents; died in Florence, where he lived much of his life, Sept. 18, 1937. Dr. Davidsohn's publications include: *Von Nordcap bis Tunis* (1884); *Philipp II, August von Frankreich und Ingeborg* (1888); *History of Florence* (his chief work, in 7 vols., of which the first appeared in 1896); and many contributions to German and Italian reviews.

**Davis, Norman Hezekiah** (1878- ), American banker and diplomat, born in Tennessee; he became prominent in the commercial and financial life of Cuba in the early years of the century; in 1917 was appointed foreign loans' adviser to the Treasury; became in 1919 a member of the Armistice Commission and of the Supreme Economic Council; and was under-secretary of State from 1920 to 1921. Frequently a member of U.S. delegations to Geneva and to disarmament conferences, in March 1933 he was accorded the rank of am-

bassador, and a month later took part in the World Economic Conference in London, at which he maintained that economic appeasement must precede any world-wide political appeasement. In Dec. 1935 he headed the American delegation to the Five-Power Naval Conference in London, which resulted, on March 25, 1936, in the signature of a six years' naval treaty by Britain, the United States, and France—Japan (who had previously withdrawn) and Italy refraining. In April 1937 Mr. Davis represented the U.S. at the International Sugar Conference in London; in May he was awarded the Woodrow Wilson Foundation medal for his work in the advancement of better international relations; and in November was again in Europe leading his country's delegation to the Far Eastern Conference in Brussels.

**Davis Cup:** see LAWN TENNIS.

**Death Duties:** see TAXATION.

**Death Statistics.** Adequate death statistics are available for about one-third of the population of the earth. They are rather more complete than birth statistics for times of peace, but are usually defective for war years. In western and northern Europe the yearly number of deaths increased from 2,421,000 in 1841-45 to 3,114,000 in 1891-95. It decreased slightly in the following years, but averaged about 3,470,000 in 1915-19. From 1920 to 1936 it varied between 2,317,000 (1934) and 2,598,000 (1922) without showing any marked tendency. For the white population of the British Empire it increased from 795,000 in 1921-26 to 825,000 in 1927-36.

The simplest method of relating deaths to population is to compute the yearly death-rate, *i.e.*, the rate of deaths per 1,000 inhabitants. The death-rate in western and northern Europe dropped from 23 in 1841-85 to 17 in 1911-14. In 1923-36 it oscillated around 13. It averaged nearly 12 in 1921-36 both for the white population of the British Empire and for the entire population of the United States.

The crude death-rate shows the proportion by which a population decreases through deaths, but it is not an adequate measure of mortality, since it is calculated without regard to the age composition of the population. The best method of eliminating the disturbing influence of the age composition is to compute a life table.

According to the life tables computed for the 1890's, the mean expectation of life of the newly born was 58 years in New Zealand, 53 years in Australia, 52 years in Sweden and Norway, 50 years

in Denmark, 48 years in Holland, 47 years in Belgium and Switzerland, 46 years in England and Scotland, 44 years in Finland, 42 years in Germany, 37 years in Austria, and 31 years in Russia (including Siberia). In no country did the mean expectation of life reach 60 years before the twentieth century. It now exceeds 60 years in Denmark, Norway, Sweden, England, Germany, Holland, Switzerland, the United States, Australia, New Zealand. In 1933 it was 61 years in England and 68 years in New Zealand. The table above shows for various countries the mean expectation of life of newly born boys and girls in the earliest period for which an adequate life table is available, and also in recent years. It shows furthermore the death-rates of the stationary population, *i.e.*, the correct death-rates, derived from the life tables.

In New Zealand, where actual mortality is lower than in any other country of the world, the correct death-rate is now 14.7. It is hard to conceive how it will ever be anywhere much lower, because a correct death-rate of 13 would presuppose a mean ex-

pectation of life of 77 years. On the other hand, the correct death-rate still exceeds 20 in many countries of Europe, and it exceeds 30 in vast areas of Africa and Asia. (R. R. K.)

**Debts, Government:** see NATIONAL DEBTS.

**Defence, National:** see NATIONAL GUARD.

**Degrelle, Léon** (1906– ), Belgian demagogue and agitator, was born of wealthy parents, and for a time practised as a lawyer. In 1935, he became notorious as the leader of a group of youths in the Catholic party, and formed within it the "Rex" (originally Christus Rex) movement, with the ostensible object of cleansing it from its impurities. This quickly became violently political, spreading charges against ministers, ex-ministers and others, particularly among the Catholics, Liberals, and Socialists; and at the general elections in 1936, 21 "Rexists" were returned, thanks mainly to propaganda and to funds suspected of being of Nazi origin since Degrelle entertained close relations with Germany. In October of that year, he visited Dr. Goebbels in Berlin and, while attempting on his return to organize a vast demonstration, was arrested, but released the following day.

In Jan. 1937, forbidden to broadcast in Belgium, he was allowed by the Italian Government to use the Turin transmitter, and seized the opportunity of attempting to spread Fascism at home. In March, in order to test popular feeling and confident of success, one of his followers resigned his seat and Degrelle stood for election; M. van Zeeland, the premier, opposed him; the result (v. Z., 275,840; D., 69,242) was a great set-back for the Rexists and a striking victory of democracy over Fascism.

In June, the coalition between the Rexists and the Flemish Nationalists, which had existed since the previous October, was broken at the instance of the latter; and in July, M. Degrelle was sentenced to four months' imprisonment (which were not served) for libelling M. Jaspar, the minister of transport. (See also BELGIUM.)

**Delaware**, one of the original States of the United States, popularly known as the "Diamond State"; area, 2,370 sq.mi.; population (U.S. census, 1930) 238,380, estimated July 1, 1937, 261,000. Capital, Dover, 4,800. The only city with larger population is Wilmington, 106,597. Of the State's population 123,146 were urban, or 51.7%; 205,694 white; 32,602 coloured, or 13.6%; 188,809 native born, white; 16,885 foreign born, white; total school attendance, 70,305.

**History.**—The Democrats having carried the State in Nov. 1936, Richard C. McMullen of Wilmington was inaugurated in Jan. 1937, the first Democratic governor since 1901. Other Democrats to take office were Edward W. Cooch as lieutenant-governor, Ernest C. Blackstone as State treasurer, and James W. Wise as State auditor. Charles L. Terry, Jr., was appointed secretary of State by Governor McMullen. During the session of the General Assembly beginning first Monday in January, 1937, the Republicans controlled the senate with William A. Simonton as president *pro tempore*, and the Democrats controlled the House of Representatives with John R. Fader as speaker. The Delaware Tercentenary Commission of 60 members was authorized by the General Assembly to prepare plans for celebration in 1938 of the 300th anniversary of the landing of the Swedes and the founding on the site of Wilmington of the first permanent settlement in the entire Delaware river valley.

The Delaware State Highway Commission was directed by the General Assembly to secure a plot for Fort Christina State park where the Swedes landed in 1638. On Dec. 7, 1937, the State of Delaware celebrated the 150th anniversary of its ratification of

R. C. McMULLEN, governor of Delaware

the U.S. Constitution, it being the first State in the Union to ratify that instrument.

The General Assembly authorized the erection in Dover of a State building to house the Corporation Division of the Department of State and Public Archives Commission, an armory in Milford, an addition to the Delaware State hospital at Farnhurst, and an addition to the Brandywine sanatorium at Marshallton. The total amount appropriated for expenses of the State Government, not including the State board of education or the State Highway Commission, for the biennium beginning July 1, 1937, was \$5,556,384.91. An unemployment compensation law was passed creating an unemployment compensation commission of

four members. A commission of five members was created to study the problem of teacher retirement pensions. An act was passed proposing an amendment to the Constitution for the reorganization of the State judiciary including the establishment of a Supreme Court consisting of three justices, and the consolidation of civil and criminal courts. James H. Hughes (Democrat) of Dover succeeded Daniel O. Hastings (Republican) of Wilmington as United States senator in January, 1937. John Biggs, Jr., of Wilmington, former chairman, Democratic State committee, was appointed judge for Third Federal Circuit Court by President Roosevelt. A new Federal post office, a court house, and a customs house building were dedicated in Wilmington. Delaware park (new race track near Stanton) was opened on June 28.

**Agriculture.**—The value of agricultural production in Delaware during the year 1937, was \$11,999,000, a decrease of \$1,125,000 from the year 1936. (G. H. R.)

**Delbos, Yvon** (1885– ), French journalist and statesman, member of the Radical-Socialist party, minister of education 1925, of justice 1936, and foreign minister since June 1936. In Jan. 1937, unveiling a war memorial at Châteauroux, M. Delbos, in reply to Hitler's Reichstag speech of the previous day, emphasized the need for Franco-German understanding and for both countries to find new markets so that industrial expansion might replace rearmament. After representing France at the Nine-Power Conference (*q.v.*) at Brussels on Nov. 3, M. Delbos expounded French foreign policy in a debate in the chamber on Nov. 18–19, emphasizing Anglo-French friendship and the necessity for its maintenance. Ten days later he visited London with M. Chautemps to receive a report from Mr. Chamberlain and Mr. Eden on the result of the Halifax-Hitler talks. Afterwards, he set out on a tour of the central and eastern European capitals, visiting Warsaw on Dec. 3, Bucharest on Dec. 8, Belgrade on Dec. 12, and Prague on Dec. 15, in each case discussing the European situation, and seeking to foster their friendly rela-

tions with France. On Dec. 10 it was announced that a plot to assassinate him at Prague had been discovered by the French police; the prospective assailant was arrested. At the end of the year M. Delbos was still in office, and he was reappointed foreign minister at the reconstruction of the Chautemps Government in the third week of Jan. 1938.

**Dementia Praecox or Schizophrenia:** see INSANITY; MEDICINE.

**Democracy.** Democracy signifies the government of the people. As the term is used today, in reference to the great States of the modern world (such as France, Great Britain, and the United States), it does not mean—as it did in antiquity—the direct government of the people itself through a popular primary assembly. It means an indirect form of popular government through a popularly elected parliament representative of the people. Modern democracy is thus connected with representative institutions; it is parliamentary democracy. This is not all. Beyond the parliament there stands an executive government which either proceeds from and is responsible to the parliament (in which case we generally speak of cabinet government), or proceeds from and is responsible to the people, in the same way and on the same footing as parliament (in which case we may speak, as in the United States, of presidential government). In either case, the executive government is a responsible government. We may therefore say that modern democracy involves the two factors of a congress or representative parliament and a responsible government. But there is a further and cardinal factor of modern democracy. If the people are to choose their representatives, there must be a number of parties (not a single party, but at least two, and possibly more than two), which submit their policies and the candidates who represent those policies to the verdict of a popular electorate. Democracy is not possible in a single-party State. This constitutes a line of division between democratic States and States both of the Fascist and the Communist type which adopt alike (however much they may otherwise differ) the principle and the practice of the single party. In the modern "conflict of ideologies," as it is often called, there is thus not only a conflict between Communism and Fascism, though that is often particularly emphasized; there is also a conflict, and a deep conflict, between States of both of these types and democratic States.

The fact that democratic States necessarily possess more than a single party, and that they necessarily involve debate between parties, and a national choice (or a nationally agreed compromise) between their different policies, leads to a further definition of the nature of democracy. Democracy is essentially a method of government by discussion—free discussion—in which different alternatives are freely submitted to the people and the people freely decide between them. In this method of government by discussion there are four stages and four organs. The first stage is the formulation of programs and the presentation of candidates who represent these programs; and the organ of this stage is party—or rather parties. The second stage is that of electoral discussions of programs and electoral choice among candidates; and the organ of this stage is the electorate. The third stage is that of discussion, by the members who have been chosen by the electorate from the different parties, of the lines of policy to be adopted by the legislature and to be expressed in legislation; and the organ of this stage is congress or parliament. The fourth and last stage is that of the final discussion and decision of policy (both foreign and domestic) by a responsible governing body which is united by a common party allegiance, which is confronted and criticized by an opposition united by a similar alle-

giance, and which keeps in close touch not only with the party (or union of parties) on which it is based, but also with the general body of the electorate and the parliament.

Two things may be said of this democratic system of government by discussion. The first is that its successful working depends on a proper harmony or balance between the four organs concerned in the system. Each must play its part: none must exaggerate its importance and its rights. The particular danger of democracy is an exaggeration of the importance and the rights of party. When party spirit and the party struggle are exaggerated and exacerbated, the result may be a party battle in which one party triumphs and proceeds to exterminate the rest. This means the institution of the single party State, and that means the death of democracy. The second thing which may be said of the democratic system of government is that it necessarily entails a regular and recognized opposition.

The whole process of discussion would fail, and cease, in the absence of an opposition.

In Great Britain and in democratic States, if a similar type in which the method of cabinet government is adopted, an essential and cardinal feature of the whole system is that a cabinet *in esse*, an actual cabinet, is confronted and criticized by a cabinet *in posse*, a potential cabinet (or, we may even say, an "anti-cabinet") which is constantly trying to evict and succeed the actual cabinet.

The evils which may be alleged against such a method of government are the evils of possible dissension; of possible delay in the decision of vital issues; of the possible failure of the government to secure the realization of its policy, and of its possible decline into a method of compromise with the opposition which emasculates its vigour and produces no definite or clear-cut results. On the other hand it may be said that debate is not necessarily dissension; that haste is not always speed; and that compromise is often the way of wisdom and of safety. In any case, as long as men have minds and opinions in their minds, they are necessarily bound to use their minds and to urge their opinions. In this sense, and from this point of view, democracy may be said to be based on the rock of human nature. (E. B.)

**Democratic Party.** With the re-election of President Roosevelt in November, 1936, the Democratic party retained control of the national administration, and increased its already large majorities in both House and Senate. In 1937, the governors of 39 States were Democrats, as were the mayors of most of the larger American cities. Postmaster-General James A. Farley remained as chairman of the Democratic National Committee. No meeting of the National Committee was held during the year. The objective of the national organization was to hold for the Democratic party, in the elections of 1938 and 1940, the commanding position which it had won in 1936 under the standard of Franklin D. Roosevelt. To this end, Chairman Farley travelled widely throughout the year, addressing meetings of party workers and conferring with State and local leaders. On March 4, President Roosevelt addressed a large Democratic victory dinner in Washington. Victory dinners were also held in many other cities, attended by party leaders and other prominent Democrats.

On several legislative issues, the Democrats in Congress were sharply divided. Many Democrats opposed the President's proposal to enlarge the membership of the Supreme Court, and many opposed other Administration measures—notably the wage-and-hour bill, the governmental reorganization bill, and the agricultural control bill.

As the year ended and the special session adjourned on December 21, it was evident that the majority party in Congress was still sharply divided on many issues.

On July 21, Senator Alben Barkley of Kentucky was elected Democratic leader of the Senate, to succeed the late Senator Joseph T. Robinson of Arkansas. In the House, William B. Bankhead of Alabama held office as speaker, with Representative Sam Rayburn of Texas as Democratic floor leader.

The scattered elections held in 1937 gave no evidence of any marked recession in the popular strength of the Democratic party. Though Bruce Barton (Republican) was elected to the House in a special election in New York city in November, to fill a vacancy in the 17th district caused by the death of the late Theodore A. Peyser, Lawrence Connery (Democrat) was elected by 3,000 majority in the seventh Massachusetts district to succeed his brother, the late William P. Connery. With some Republican support, Maurice J. Tobin (Democrat) was elected mayor of Boston in a contest in which party lines were broken down.

The New York city election in November, which resulted in the re-election of Mayor Fiorello La Guardia on a coalition ticket, was the most important election of the year. La Guardia won by a plurality of 453,374 over his Democratic opponent, Judge Jeremiah T. Mahoney. Thomas E. Dewey, who had achieved prominence by his drive against racketeers, was elected district attorney on the coalition ticket. Though Chairman Farley had backed Judge Mahoney, La Guardia in his social and political philosophy was sufficiently a New Dealer to cause the National Administration to view his victory as a partial triumph for New Deal ideas. Previously in the Democratic primary, Judge Mahoney had decisively defeated Senator Royal S. Copeland who had campaigned on an anti-New Deal platform.

The New York election was significant for three reasons: first, in dealing a smashing blow to Tammany Hall, of old the dominant political organization in the city; second, because of the surprising strength shown by the American Labor party, which polled about 480,000 votes in its second appearance on the New York city ballot; and, third, because in the defeat of Justice Mahoney, the regular Democratic organization lost its bid to recapture control of the city's political organization, held by La Guardia for the past four years.

Under the auspices of the Democratic National Committee, and as a means of raising money to help liquidate the Democratic party's deficit copies of the Philadelphia 1936 souvenir convention book, many of them autographed by the President, were sold to corporations and private individuals. Opponents of the Administration charged that this was a violation of the corrupt practices act, and that the sales were disguised contributions forced from corporations having business relations with the Government.

House Republican leader Snell demanded an investigation by the Department of Justice of the sale of the Democratic campaign books. In a reply to Mr. Snell, Attorney General Cummings declared that the sale of the books was not a violation of the existing statute.

In a special election held on October 18, Representative John E. Miller of Arkansas was elected to the Senate to take the place of the late Senator Joseph Taylor Robinson. On Aug. 19, 1937, Mrs. Dixie Bibb Graves, wife of Governor Graves of Alabama was appointed to the Senate to fill the vacancy caused by the resignation of Hugo Black, who had been appointed an associate Justice of the Supreme Court. At the close of the year, the Democrats held 76 seats in the Senate, and 330 in the House of Representatives. (See also ELECTIONS.) (O. McK.)

**Denmark,** kingdom of north central Europe, member of the League of Nations. Bounded N. and E. by Baltic waters, S. by Germany, and W. by the North sea. Capital, Copenhagen. Ruler, King Christian X (born 1870; succeeded 1912). National flag, a white St. George's cross on a red ground.

**Area, Population, and Cities.**—Area: 16,575 sq.mi.; population: (1935 census) 3,706,349:

Division	Area (sq.mi.)	Population (1935)
Copenhagen (city)	28	666,269
Baltic islands	5,136	1,367,845
Jutland peninsula	11,411	1,672,235

Administratively, the country is divided into 21 counties (*Amter*).

The established church is Lutheran, and though religious toleration is complete, less than 50,000 hold other or no beliefs.

Primary education is compulsory; in 1935, 4,556 schools had 495,000 pupils, Copenhagen university, over 5,000; secondary specialized schools are diverse and numerous.

Leading towns (1935 populations): Copenhagen, 843,168; Aarhus, 90,898; Odense, 76,116; Aalborg, 48,132; two others averaged 30,000.

**History.**—The king shares legislative power with a parliament (*Folketing*, 149; *Landsting*, 75). Suffrage is universal (over 25), representation proportional. The premier and 11 ministers form a state council, acting under the king's presidency.

Domestic events included celebration of the silver jubilee of the king's accession (May), the wedding of Princess Feodora, eldest daughter of the king's brother, Prince Harild, to Prince Christian of Schaumburg-Lippe (September), and, in September, the opening by the king of the Storstrøms bridge, the longest in Europe (over two miles, linking Masnedö and Falster islands, and shortening the Copenhagen-Berlin rail-journey by 50 minutes; built with British steel and in part by British labour). A bomb was ineffectively exploded outside the house of the defence minister (June).

The Army and Navy Bill (February) made modest proposals, with no increase in the air force. Hr. Stauning, the premier, commented (Stockholm; March) on a defensive alliance between the northern democracies, and visited London (April) relative to Anglo-Danish trade, Denmark having increased her British imports by 70% during 1931-36.

#### Trade, Communications, and Finance.

—The staple products are bacon, butter, and eggs, very largely exported to Great Britain. Imports for 1936: 1,484,084,000 kroner (£66,254,000); exports: 1,379,642,000 kroner (£61,591,000); both showing rises maintained in the first half of 1937.

Mercantile marine: 2,046 ships (1,187,200 tons). Mileage: railway (half state-owned), 3,200; road (main), 4,796. Telegraphs and telephones are well developed.

KING CHRISTIAN X of Denmark, who celebrated the twenty-fifth anniversary of his reign May 12, 1937

DENMARK: Industrial production. Monthly index, partly adjusted for seasonal variation (*The Annalist*)

The currency unit is the krone (at par, 18.16 kroner=£1= \$4.87). Notes in circulation by National Bank (1936): 398,558,000 kroner.

Budget estimate for 1938-39 (largest on record): revenue 477,000,000, expenditure 475,000,000 kroner.

**Defence Forces.**—National militia, 14,000 all ranks; 65 aeroplanes. Navy, 2 coast defence, 5 fishery patrol, 8 submarine, and smaller craft.

**BIBLIOGRAPHY.**—M. Edelberg (Editor), *Denmark in Word and Picture* (translation: Copenhagen, 1935). (H. Fw.)

**Dental Association, American:** see DENTISTRY.

**Dentistry.** Out of the mass of ideas and ideals, aims, and objects that have been fermenting in dentistry and dental education during the past twenty years, there came in 1937 the crystallization of a point of view which is of outstanding importance to health. Dentists and dental educators throughout the United States signified their almost universal acceptance of the basic principle, long preached by their leaders, that health in the mouth is intimately associated with health in the body and that the physical welfare of the patient as a whole is as much the concern of the dentist as it is the concern of the physician.

Three major events occurred during the year to bear witness of the widespread adoption of this point of view. First, all class A dental schools commenced the academic year in September on the basis of the so-called "two-four" plan of education. Second, two university dental schools offered for the first time, an entirely new type of course aimed at preparing dental graduates for the dental public health service. Third, the American Dental Association, the official professional body for the United States numbering 40,000 dentists, adopted for its principal theme at its annual convention last July, "Preventive Dentistry in the Interest of Health."

Of these three events, the third has a special significance because it represents the recognition by the large body of dental practitioners that dentistry is a true health service and that it should take a larger responsibility in the prevention of disease and the maintenance of health than it has hitherto.

While the first two events affect dental education primarily and thus appear to be largely of academic interest, in reality

they will profoundly influence the whole practice of dentistry and will improve the quality of service. The "two-four" plan, which went into effect in all class A dental schools this year, means that the minimum requirements for an education in dentistry are two years of study in a college of arts and sciences followed by four years in the dental school. Professions advance about in proportion to the advance in the quantity and quality of their requirements in education. Dentistry has always lagged behind medicine in this respect, and this has offered a serious obstacle to a close co-operation and a spirit of equality between the two professions.

Dentistry has experimented for more than a dozen years with a variety of educational plans, each of which has had merits and has aimed at raising the quality of preparation. With the almost universal adoption of the "two-four" plan, dentistry is at last on a plane of equality educationally with the minimum requirements prevailing in medicine. Thus a great barrier to professional co-operation has been removed.

The establishment of courses in training for the dental public health service by two leading universities came in response to a large demand. The need of strong dental divisions in State and city departments of public health was widely recognized. In some States and in some of the larger cities, such divisions have been organized, but when men who were competently trained to administer the work were sought, it was found that they are almost entirely lacking. The offering of these courses naturally followed. In one of these universities, the course is being offered under the joint auspices of the School of Public Health and the Dental School, a collaboration which signifies the progress made by dentistry in recent years.

Still further evidence of the acceptance of an enlarged responsibility is the fact that in all the clinical branches of dentistry, the importance of case study is being emphasized, not only in practice but as a teaching procedure in the schools. This means that attention is no longer directed just to the teeth and to the possibilities of repair of damage caused by dental disease. The larger aspects of the problem are considered, especially the causes of the condition and the relation which the general physical health of the patient bears to the particular dental problem. The dietary, metabolic, and endocrinological factors influencing the maintenance of health in the oral structures are studied, and the current medical knowledge in these fields is focused on the diagnosis and treatment of dental disease.

A review of the literature in internal medicine, pediatrics, endocrinology, chemistry, bacteriology, and physiology, shows that in investigation there is an obvious trend, although sporadic, among the clinicians of both medicine and dentistry to combine efforts in the study of disease.

This is especially true in studies on growth and development, infectious diseases, and nutrition. Of particular importance has been the establishment in many dental schools, along with the increased teaching of the principles of medicine, of clinical medical laboratories, which aid in the diagnosis of diseases of the dental structures.

Investigative work during the year was largely concentrated on the approach to dental problems from a basis of fundamental science. A brief review of typical studies in the United States and abroad will illustrate the point. May Mellanby of England concludes that the quality of tooth structure is of greatest importance, being dependent upon nutritional factors during formation, and that with our present knowledge of nutrition, it should be possible to reduce decay. Van Kreudenstein of Germany found in parathyroidectomized rats that calcification was largely a matter of raising the calcium content of the blood. Boyle, Bessey, and Wolbach at Harvard produced diffuse alveolar

atrophy in animals fed diets deficient in vitamin C (ascorbic acid), and these findings corresponded in essential characteristics with type II pyorrhoea found in human beings. Perla and Sandberg of New York city concluded that the adrenal gland is not essential in the production or utilization of vitamin C, but described interesting changes in the incisor teeth of adrenalectomized animals. Schröder of Germany found that inheritance plays a large part in cleft palate cases. The subject of inheritance was an important topic in Germany during the year, and several interesting studies were published.

In conclusion, it can be stated that a fundamental scientific approach to dental problems by competently trained men has begun, and real progress in the field of dentistry as a branch of medicine should result. Because practitioners, educators, and investigators gave widespread evidence in 1937 that dentistry's program is now based upon this precept, the year, 1937, marks a milestone in the progress and advancement of the profession.

**Dernburg, Bernhard** (1865–1937), German banker and cabinet member who served as propaganda agent in the United States during the first years of the World War, was born in Darmstadt, July 17, 1865. After early establishing himself as secretary and director of the Deutsche Bank of Berlin, he was appointed Colonial Secretary in 1906. He was forced to resign in 1910, but remained a confidant of the Kaiser until chosen as German spokesman to the United States. Returning to Germany in 1915 following failure of his American efforts, he remained in the background until he became finance minister of the Republic following the war. After leaving this post, he continued prominent in German business until forced to retire in 1933 because of his Jewish blood. He died in Berlin, Oct. 15, 1937.

**Destroyers:** see LONDON NAVAL CONFERENCES; NAVIES OF THE WORLD; REARMAMENT.

**Detroit,** in Wayne county, in South-eastern Michigan, and on the Detroit river, the metropolis of the State, and the fourth city in the United States; area, 139.6 sq.mi.; population (U.S. census, 1930) 1,568,662; (estimate, 1937) 1,667,000. Foreign-born, 399,281, Polish and Canadian predominating. Assessed value, \$2,402,395,880; gross bonded debt, \$384,525,446; gross city appropriation, \$132,147,867; tax levy, \$59,280,482; tax rate for city purposes, \$24.68.

The economic, and to some extent, the governmental life of Detroit is largely determined by the production of automobiles. South-eastern Michigan builds 52% of the automobiles manufactured in the United States. It is estimated that one-half of the remainder are assembled from parts fabricated in Michigan. The decline in automotive production beginning in 1929 brought acute unemployment and heavy expenditures for relief to Detroit fully a year before the depression seriously affected the United States

as a whole. The first of the large cities to go into the depression, Detroit experienced an unusual economic recovery in 1937 due to the renewed buying of automobiles. This recovery was marked by a decided regression in the latter part of the year. During the year the industry produced slightly under 5,000,000 cars or 10% fewer than the peak year of 1929. In spite of technological advances, the industry reported a peak employment of 564,000 workers or 16% over the previous high. It is estimated that only 464,000 workers were employed in Dec. 1937 due to the marked recession in business and there was a further decline in employment in early 1938.

These wide variations in employment and unemployment had marked effect upon the relief load of Detroit and Wayne county and on the public finances of Detroit. In Dec. 1934, the relief rolls reached an all-time high of 55,562 families, or 13% of the 419,600 families enumerated by the school census. During 1934–35, 76,586 separate families were assisted. In 1937, due to Federal work relief and economic improvement, Detroit had the lowest relief load of any large city. In July 1937, only 14,301 families were on the rolls, or 3% of total families, and the total assisted during the year was 33,171.

Economic improvement was marked by the beginnings of the "sit-down" strike in the United States which for a few days reached epidemic proportions in the Detroit area. The Federal Labor Relations Act and Supreme Court affirmation of its legality brought to the surface a long threatening labour unrest. The first "sit-down" strike occurred in the plants of the General Motors Corporation in Flint in late Dec. 1936. Governor Frank Murphy insisted that the issue be settled without bloodshed regardless of technical legal considerations. After several efforts, and the intervention of the President of the United States, the strikers vacated the plants and elections were held under the supervision of the Federal Labor Relations Board which resulted in the recognition of the United Automobile Workers as the principal but not necessarily the sole bargaining agent with the company. The movement spread rapidly and during the spring and summer practically all automobile and parts manufacturers were subject to "sit-down" strikes and entered into union engagements with their employees. The Ford Motor Company was an exception. Strikes in the automotive plants were followed by "sit-down" strikes in many small industries and in the retail trades, frequently conducted by persons not employed by the companies affected. After some days of hesitation, the police intervened when there was disturbance of the peace and ejectments were made by the sheriff when a court order was obtained.

The movement for labour recognition led to an effort to install a Detroit government supported by labour. A former attorney-general of the State, Patrick O'Brien, Democrat, was endorsed by the United Automobile Workers for mayor and five prominent labour leaders were endorsed for the city council. Richard Reading, Republican, and city clerk for 12 years, ran as the "non-partisan" candidate. The issue was sharply drawn between the supporters of non-partisanship, which has been actually in effect in Detroit for twenty years, and labour, which proposed in the words of their candidate "to seize the reins of government." In the election, the "labour" candidate for mayor received 37% of the vote cast and all labour candidates for the Council were defeated.

Detroit was the largest American city to default on its public debt. This debt has been refunded but at a heavy cost in deferred interest. However, current tax collections are approaching normal, delinquent taxes are being liquidated, the tax budget much reduced, and there is distinct evidence of restored credit with normal city operations.

**Deuterium:** see HEAVY HYDROGEN.

**De Valera, Eamon** (1882— ), Irish statesman. For details of his career up to 1927, see *Encyclopaedia Britannica*, vol. 7, p. 282. From 1932, when he succeeded Mr. Cosgrave, until 1938, he was president of the executive council and minister for external affairs of the Irish Free State. Passing through London on Jan. 14 on his return from Zürich, where he had visited an eye specialist, Mr. de Valera met Mr. Malcolm MacDonald, secretary for the dominions, and informally discussed Anglo-Irish relations. On March 17 he broadcast to Australia on the same subject, and in April issued the text of the proposed new constitution for "Eire," which was approved by a majority of the electors at a referendum in July. Speaking in the Dail on May 19, he reaffirmed the impossibility of resuming the disputed land annuity payments to Great Britain, and fore-shadowed the possible departure of Ireland from the League of Nations unless that body became more self-reliant and acted more on its own initiative. After the general election, Mr. de Valera was on July 22 re-elected president of the Free State executive council, with Labour support, by 82 votes to 52. On the coming into operation of the new constitution of Eire (see IRISH FREE STATE) on Dec. 29, Mr. de Valera automatically became "Taoiseach" or prime minister, and an *ex officio* member of the Council of State which will aid the president of Eire when he is elected.

**Devil's Island:** see FRENCH GUIANA.

**Diabetes.** Diabetic mortality advances. Among countries the peak, 22.5 per 100,000, was reached in the United States for 1935; for 1936, it was 27.8 among 187 American cities, 31.2 for the 5 largest American cities, and 34.9 for New York city. In general, the percentage increase is greatest in those regions where formerly the rate was among the lowest.

In Italy the rate was 4.5 in 1920, but reached 9.5 per 100,000 in 1934 and these figures are almost duplicated in the Canadian province of Saskatchewan. Eventually, when adjustments are made for the factors of age, social status, race and wealth and for uniformity of standards of diagnosis and collections of statistics, will diabetic mortality everywhere reach Boston and New York City levels? And where and when will diabetic mortality first begin to decline?

The use of protamine zinc insulin has steadily increased in the United States since it became generally available in February 1937. In certain clinics for fresh cases of diabetes it has largely displaced regular insulin and has even been employed along with regular insulin in the treatment of diabetic coma. Its action persists, although in lessening intensity, for more than 48 hours and herein lies danger unless food is ingested at sufficiently frequent intervals to replace loss of glycogen. Rather than raise the dose of protamine insulin unduly, frequently it is supplemented with regular insulin, both varieties being injected simultaneously before breakfast.

Hypoglycemic reactions occur with protamine insulin, but they are less frequent, less severe and somewhat different in type from those with regular insulin. Fatigue, nausea and headache are common whereas tremor, sweating and even hunger do not always appear. The onset of reactions is so gradual as often to escape recognition. Hypoglycemia without obvious signs may reach 0.030 per cent. For these reasons it is sound insurance to insert a small carbohydrate lunch between meals and on retiring, but patients prefer such procedures to multiple injections of regular insulin.

With protamine insulin the control of diabetes is better than with regular insulin. Protein catalysis and acidosis are lessened, hepatomegaly reduced and gain in weight favoured. The diabetic

approaches more closely to a normal individual. Insulin in the production of hypoglycemia for the treatment of schizophrenia has given additional emphasis to the varied mental and nervous phenomena so produced.

Glycosuria was produced by Houssay, Evans, and others with injections of anterior pituitary extract, but it remained for F. G. Young, a pupil of C. H. Best working in the National Research Council laboratory under Sir Henry Dale, to cause permanent diabetes in a dog by similar injections but repeated daily for 26 days or less.

Dog 28 died of diabetic coma nearly 10 months after the last administration of pituitary extract.

Young's work already has been confirmed by Best. Young is the first to demonstrate the experimental production of diabetes mellitus without direct interference with the pancreas and this would appear to represent the most notable progress in the study of diabetes since the discovery of insulin. (E. P. Jo.)

**Diamonds.** The principal sources of supply are the Belgian Congo, the Gold Coast, South Africa, Angola, South-West Africa, and Sierra Leone, production in which countries is handled under a quota system by a central organization known as the Diamond Corporation, through the Diamond Trading Company.

Production in South Africa, which is one of the most important sources of supply of fine gems, was virtually suspended during the later years of the world depression, and was not resumed until March, 1936, and then only on a very small scale, deliveries meanwhile being made out of stocks. Production in South Africa was extended last year, but still fell considerably short of deliveries. Output in the other countries mentioned, whose customers, particularly in the case of the Congo, include a high proportion of industrial users, was largely increased, particularly in Sierra Leone, where a very rich field has been developed during the past few years.

Sales of uncut diamonds to the trade by the Diamond Trading Company reached last year the highest level since 1929, having amounted to £9,200,000, compared with £8,500,000 in 1936, £6,235,000 in 1935, and £3,719,000 in 1934. The expansion last year, reflecting in part an increase in prices fell considerably short

WORLD PRODUCTION OF DIAMONDS, 1936: total 8,296,905 carats

of expectations owing to the sudden transition from prosperity to depression in the United States, which normally absorbs from 70 to 75% of the total sales.

It is in the industrial sphere that the diamond industry has made its steadiest if least spectacular progress. More than half of the annual sales by weight, though only about 15% by value, is now for industrial uses, principally cutting, grinding, and other abrasive purposes; for the diamond is immeasurably the hardest and most enduring of known substances, and its uses are being constantly extended and cheapened.

Figures of world production in 1937 are not yet available. The caratage for 1936 amounted to 8,296,905, compared with 7,622,900 in 1935, that for Angola being 580,000, the Belgian Congo 4,800,000, the Gold Coast 1,489,410, Sierra Leone 450,000, South-West Africa 184,900 and the Union of South Africa 623,922.

(P. F.)

**Diatomite.** The accumulated siliceous remains of multitudinous numbers of microscopic organisms known as diatoms have found so many industrial uses that the product is now mined in large tonnages, and goes to the market as the mineral formerly called kieselguhr, but now usually known in English-speaking countries as diatomite.

Its chief uses are as a heat insulator, a filter-aid in many types of chemical industry, a filler in paints, varnishes, enamels and rubber, as an admixture in concrete, and as a carrier for insect poisons. Roughly, production is of the order of 100,000 tons annually in the United States, about half that amount in Germany and Denmark, 12,000 tons in Algeria, and smaller amounts in a number of other countries.

(G. A. Ro.)

**Diesel Engines:** see MOTOR CARS: *Trucks and Buses*; MOTOR TRUCKS.

**Dietetics.** An outstanding accomplishment of the year has been the recent synthesis of vitamin B<sub>1</sub> by Williams and Cline. The essential rôle played by this factor in tissue respiration finds further testimony in the discovery of Löhmann and Schuster that the vitamin is an integral part of an enzyme system which is concerned in cell metabolism. That another vitamin of this group is also essential to the function of living cells is seen in the observation of Dietrich and Pendl that the muscular contractions of a heart weakened by perfusion under low oxygen tension were restored to normal by the addition of minute quantities of riboflavin, and also in the discovery of Day and associates that riboflavin will prevent nutritional cataract in rats. Another member of the vitamin B complex, B<sub>6</sub>, or vitamin H, has been further identified by Booher as a relatively heat stable factor which is essential for growth and the prevention of an erythredemic dermatosis in rats. The existence of two additional members of this complex was discovered by Elvehjem and associates who described a "Filtrate Factor" and a thermolabile factor called Factor W. Among the ten different sterol derivatives which are known to exhibit the antirachitic properties of vitamin D, Bills and associates report at least two forms in the oils derived from the livers of various species of fish. The most recent addition to the list of vitamins is the antihæmorrhagic vitamin which Almquist has isolated in crystalline form.

Significant in the literature on minerals are the reports of Stearns and Stinger and of Macy and associates that both the iron and the calcium of spinach exist in such firm combinations as to interfere materially with their utilization, and that this food therefore, is not a particularly good source of these two elements. A hitherto unrecognized rôle played by mineral salts, notably by calcium and potassium, is seen in the discovery of Eppright and

associates that the presence of these salts in the intestinal tract is essential in preventing the development of putrefactive organisms.

Protein deficiency, according to Weech and associates produces in dogs a depletion chiefly in serum albumin, to a less extent in hæmoglobin, and to a relatively slight extent in serum globulin; the total protein loss is one-fifth from the circulation and four-fifths from the tissues outside the blood stream.

Of clinical interest is the perfection by Jeans and associates of their photometric technique by means of which they found that 19 to 35 per cent of the children examined by them were subnormal in respect to vitamin A. Of like interest are the studies of Faulker and Taylor who demonstrated that the ascorbic acid levels in the blood of patients suffering from infections were abnormally low. Of significance, too, is the description by Weiss and Wilkins of the cardiovascular disturbances which frequently follow nutritive deficiency, particularly the "beriberi heart," and the report by Means and associates of the occasional occurrence of thyrotoxicosis resulting from malnutrition.

Outstanding among the researches in deficiency diseases were the studies on pellagra of Spies and associates who demonstrated that endemic pellagra, like alcoholic pellagra, responds remarkably well to a high calorie diet containing an abundance of protein with large amounts of yeast, and to liver extract by mouth or parenterally. Likewise, Miller and Barker in their studies on Sprue achieved excellent results with diets high in protein (large quantities of rare, red beef), and low in carbohydrate and fat. Of every day interest are the studies of Alvarez upon digestive discomforts which he finds are frequently due to allergy or to other food idiosyncrasy; he emphasizes the diagnostic value of written dietary records and of elimination diets.

**Disarmament:** see ARMIES OF THE WORLD; LONDON NAVAL CONFERENCES; REARMAMENT.

**Disasters.** During 1937 the toll of losses in life and property in accidents and disasters included the following:

#### Aviation

- Jan. 12 Burbank, Calif. Aeroplane hits mountain. 2 killed including Martin Johnson, explorer.
- Feb. 7 Louisburg, N.C. Privately owned aeroplane crashed. 4 killed.
- Feb. 9 San Francisco. Aeroplane with 11 occupants plunged into bay.
- Feb. 19 Australia. Brisbane-Sydney Route. Aeroplane crashed. 5 lives lost.
- Mar. 22 England. Duchess of Bedford in solo flight disappeared along East Coast.
- April 3 Arizona. Aeroplane bound for New York crashed at altitude of 8,500 feet. 8 killed.
- May 6 Lakehurst, N.J. German airship *Hindenburg* destroyed by fire. 56 out of 97 occupants killed.
- May 29 Empire Air Day in Great Britain. Nine accidents, 17 killed, including woman ill in a house struck by civilian aeroplane.
- June 2 Isle of Aulin, Chile. Aeroplane crash. 9 killed.
- June 7 Great Britain. During week-end, 7 of Royal Air Force and one civilian were killed in aeroplane accidents.
- July 2 Bound for Howland Island in Pacific, Amelia Earhart with pilot, Capt Fred Noonan, lost. Supposed to have run out of fuel.
- July 28 Near Brussels. Dutch aeroplane struck by lightning. 15 occupants killed.
- Aug. 2 Wadi Halfa, Sudan. Italian aeroplane crashed. 9 killed.
- Aug. 3 Wreckage of Pan-American seaplane discovered by U. S. navy plane 20 miles off coast of Colombia. 14 passengers missing.
- Aug. 12 Russian aeroplane carrying Sigismund Levanevsky, "the Soviet Lindbergh" and five assistants lost in Arctic after crossing North Pole in effort to pioneer a plane route to the United States for passengers and freight. Search by Sir Hubert Wilkins and others unavailing.

LESS THAN TWO MINUTES after the fire broke out the "Hindenburg" was completely engulfed in flames and smoke

THE GERMAN ZEPPELIN "HINDENBURG" prepared to land at U.S. Naval Air Station, Lakehurst, New Jersey, at end of a trans-Atlantic voyage, May 6. As a ground crew was towing the great ship to the mooring mast flames of undetermined origin suddenly burst from the ship

FLAMES from 6,700,000 cubic feet of inflammable hydrogen gas, which inflated the "Hindenburg," burn out quickly

**RUINS** of the New London, Texas, public school, where an explosion of gas on March 18, 1937, wrecked the building and killed 427 children and teachers

Nov. 6 United States. 18 persons killed in 3 motor accidents each costing 6 lives, near Rhinebeck, N.Y., Knox City, Missouri and Adairsville, Georgia.

Nov. 29 Amsterdam. Prince Bernhard's roadster collided with motor truck. Prince injured.

## Aviation (Continued)

- Sept. 11 Scarborough, England. King's Cup Air-Race. Aeroplane crashed. 2 killed.
- Sept. 15 Near Lima, Peru. Aeroplane crashed against hill. 8 killed.
- Sept. 16 Afghanistan. 3 German fliers, en route from An-si-chow in Province of Kansu for Kabul are declared missing.
- Sept. 30 Essex, England. Collision of two Royal Air Force planes. 3 killed.
- Oct. 2 Near Athens. British airliner crashes. 3 passengers drowned.
- Oct. 15 Island of Banda, East Indies. Dutch navy plane fell into sea, 5 killed. Third Dutch Indies plane crash in 10 days. Total fatalities, 17.
- Oct. 17 Chalk Mountain, Wyo. Aeroplane crashed. 19 killed.
- Oct. 20 Spilsby, Lincolnshire. R.A.F. plane crashed. 3 killed.
- Nov. 3 Near Seattle, Wash. Navy planes collide. 5 killed.
- Nov. 6 Near Ostend, Belgium. Aeroplane from Cologne to London hit chimney of factory. 8 persons and 3 of crew killed, including 5 members of royal family of Hesse.

## Fires and Explosions

- Jan. 17 Explosion of sulphuric acid on Canton-Hongkong train. 80 killed, 50 injured.
- Jan. 25 Antofagasta, Chile. Premature explosion of 1,500 tons of dynamite in copper mine killed 16 workmen and injured 201.
- Feb. 5 Louisville, Ky. Explosion in building kills 10 persons.
- Feb. 13 Antung, Manchoukuo. Theatre fire, 658 bodies recovered.
- Feb. 18 San Pedro, Calif. Shell bursts in breech of naval gun. 6 killed, 10 injured.
- Mar. 18 New London, Texas. Explosion of natural gas in school. 413 children and 14 teachers killed.
- Mar. 28 Dubois, Pa. Explosions kill 2 miners and 7 rescuers.
- July 2 Staffordshire, England. Explosions in coal mine. 30 killed, many injured.
- July 9 Skanslandet, Finland. Explosions of ammunition. 11 killed, widespread damage.
- Aug. 5 Paterson, N.J. Gas explosion in plant. One killed, 40 injured.
- Aug. 18 Philadelphia Navy Yard. Steam pipe explodes on destroyer "Cassin." 7 killed, 4 critically injured.
- Aug. 22 Cody, Wyo. Forest fire. 14 killed, 50 injured.
- Dec. 6 Gloversville, N.Y. Explosion in children's store, attributed to oil burner. 5 killed.

## Motor Traffic

- Jan. 25 Florida motorbus from Miami to Tampa overturned in canal. 17 of 32 occupants drowned.
- Mar. 24 Salem, Illinois. Motorbus burst tire. 18 killed, 5 injured.
- June 4 Shiloh Springs, Oregon. Motorbus overturned, 7 killed.
- Oct. 22 Mason City, Iowa. Streamlined train struck school bus. 9 killed, 21 injured.
- Oct. 30 Prince Victor Nityendia Marayan of Cooch Behar, uncle of the Maharajah, killed by motor car.

## Miscellaneous

- Feb. 17 San Francisco, Calif. Scaffolding on Golden Gate bridge collapses 10 killed.
- July 24 Countess of Cardigan (formerly Miss Joan Salter) killed by fall from hotel window.
- July 25 Manhasset, Long Island. Vivien Burnett, original of "Little Lord Fauntleroy" rescued 4 persons from an overturned boat and himself collapsed.
- Sept. 25 Alexandria, Egypt. 22 persons killed and many injured in a crush of crowds to honor King Farouk.
- Oct. 25 United States. Distribution of new drug, elixir of sulphanilamide, accompanied by 46 deaths.
- Dec. 29 Oneida, N.Y. Dr. Toyokichi Iyenaga, Japanese diplomat and lecturer, drowned while fishing through ice.

## Natural Disasters

- Jan. 22 In Mississippi, Allegheny and Ohio valleys. Disastrous floods begin, causing an estimated 900 deaths.
- Jan. 29 Northern Europe. Violent storms. Loss of life exceeds 100. Many ships wrecked.
- Jan. 30 Alpine avalanche kills 23 Italian soldiers.
- April 27 Further floods along Allegheny, Monongahela and Ohio valleys. In London, Ontario, flood costs 5 lives and serious damage.
- May 27 Tlalpujahua, Mexico. Cloudburst washes mine tailings onto dwellings. 168 reported dead.
- June 15 Nanga Parbat, Himalayas. Avalanche believed to have overwhelmed German expedition led by Dr. Wien. Six Germans and 9 native porters missing.
- Aug. 11 New Brighton, Staten Island. Downpour causes collapse of buildings. 19 inmates killed.
- Menlo Park, New Jersey. Lightning struck Memorial Tower on site where Edison invented electric bulb. 130 foot structure fell to ground.
- Oct. 28 Dmeir, Syria. Cloudburst overwhelms many houses. 100 missing.
- Nov. 13 Greek freighter "Tzenny Chandris" foundered off North Carolina 7 lives lost.

## Railways

- Mar. 13 Corquoy, France. Express derailed by tree fallen across tracks. 15 killed, 20 injured.
- April 2 London, Battersea Park. Collision of electric trains. 10 killed, 11 injured.
- July 17 Worst railway accident in India. Delhi-Calcutta express derailed. 107 persons killed.
- July 29 Paris-St. Etienne express wrecked. 30 killed, 40 injured.
- Sept. 5 Neuss, Germany. Train wreck. 15 Catholic pilgrims killed.
- Nov. 2 Near Sao Paulo, Brazil. Train smash. 9 killed, 70 injured.
- Dec. 10 Castlecary, near Falkirk, Scotland. Railway collision. 35 killed. 63 injured.

**Disciples of Christ**, a religious body of the United States and Canada which received its initial impulse in 1809, dates its separate existence from 1830 and its

nationally organized missionary work from 1849. It is congregational in polity. General agencies for missionary and benevolent work include: the United Christian Missionary Society, Stephen J. Corey, president, with divisions of home and foreign missions and Christian education; a Board of Church Extension; a Pension Fund; an Association for the Promotion of Christian Unity; and a College Association, all with headquarters at Indianapolis, Ind.; and a National Benevolent Association, with headquarters at St. Louis, Mo., which conducts six homes for children, six homes for the aged and one hospital. The 1937 convention was held at Columbus, Ohio, with A. W. Fortune as president. F. D. Kershner is president for 1938. There are also many independent missionary agencies which do not report to this convention, and State missionary societies which report to State conventions. A World Convention is held quadrennially (Toronto, Aug. 6-12, 1940). Receipts by all national and State boards for the last fiscal year totalled \$2,928,476.82; receipts by churches for local expenses, \$9,768,527.71. The membership in the United States and Canada is 1,607,716. The Disciples of Christ participate in the work of the Federal Council of Churches of Christ in America, the present president of which, Edgar De Witt Jones, is a Disciple. The church was represented at the 1937 conferences at Oxford and Edinburgh, and is taking a part in the steps leading to the organization of a World Council of Churches. (W. E. G.A.)

**District of Columbia:** *see* WASHINGTON, D.C.

**Divorce.** Divorce has not been prominent either in public discussion, legislation, or sociological investigation during 1937. Although nearly half the States of the Union have had legislatures in session during the year, the majority of these have passed no laws with regard to divorce. Three have made substantial changes in divorce legislation. Idaho has changed the time required for the getting of a divorce from ninety days to six weeks. Maryland has added five years of separation without reasonable expectation of reconciliation to its grounds for divorce. Montana has added incurable insanity, under the following conditions: testimony of competent physicians, evidence that the insane person has been regularly confined in a State institution for the insane for five years, the giving of notice of the application for divorce to blood relatives or guardian and to the superintendent of the institution, these persons being entitled to appear and be heard on all the issues. The status of the parties as to support and maintenance

of such insane persons is not altered by the granting of the divorce.

Although many prominent Americans have been divorced in 1937, these marital failures have not had a large place in public interest. The courts have wrestled with the legal entanglements associated with divorce. The majority of their decisions have had to do with questions of alimony and foreign jurisdiction; that is, the status of persons affected by a divorce that has been granted in a foreign country or in some other State. Alimony is proving itself one of the most vexing of the questions associated with the American divorce system. One suggestion during the year has been that it be replaced by some sort of marriage insurance. Divorce cases constitute a large part of the civil load of the State courts. In a study of law administration in Connecticut, published in 1937, divorce actions numbered 24.6% of the total number of cases, or, without annulment, one-fourth of all the cases.

There has been a marked trend in the ecclesiastical attitude toward divorce, the churches showing evidence of a feeling of greater responsibility to aid those marrying to achieve success. The feature of the year has been the spread of instruction in preparation for marriage in the churches, in popular magazines, and especially in the colleges. At the general convention of the Episcopal Church the subject of the re-marriage of divorced persons received more widespread public interest than any other. The proposal to give the bishops wide discretionary power in the matter of such marriages, although overwhelmingly defeated, was aggressively supported by some prominent members of the church.

(E. R. G.)

**Great Britain.**—The Matrimonial Causes Act, 1937, timed to come into force on Jan. 1, 1938, is no doubt the most important English statute relating to divorce since the original act was passed in 1857, permitting divorce for adultery on the petitions of husbands, and for adultery coupled with desertion or cruelty on those of wives. By the Matrimonial Causes Act, 1923, the need for proof of desertion or cruelty in the case of a wife's petition ceased, so that either spouse could thereafter petition alleging adultery only. The new act adds as causes for divorce, desertion for three years, cruelty, and incurable insanity after five years' continuous care and treatment of the respondent. In this respect the English divorce law is enlarged so as to approximate to the majority of Continental, American, and Dominion models. On the other hand, by a provision which does not appear to have a parallel elsewhere, divorce is forbidden during the first three years of

U. S. COAST GUARD cutter "Chelan" rescues crew of the sinking Norwegian freighter "Bjerkli," after the freighter sprang a leak 500 miles east of the Nantucket lightship

marriage unless the case appears to the court to be "one of exceptional hardship suffered by the petitioner or of exceptional depravity on the part of the respondent." The court is thus given a discretion as to the exercise of which a practice will no doubt be laid down to bind the judges. The question whether judges who are given judicial discretion should be fettered by precedents is of course controversial, but in the divorce court it is answered in the affirmative.

A provision of great importance indirectly is that in section 11 of the act, adding adultery as a ground for a separation order by a magistrate in favour of a wife. Directly, of course, it is of no special importance, for neither husband nor wife is required by law to live with an adulterous spouse, unless the adultery has been condoned. Section 6, however, provides that high court judges may treat a magistrate's order as proof of the facts on which it is based, provided that the petitioner gives his or her evidence in the high court. This again is a matter of discretion, and very much will depend on its exercise. If the court interprets its powers broadly, the expense, serious to the large classes who are just above the tests for "poor persons" of bringing witnesses to the high court or to assizes will no longer be a burden. The reproach of "one law for the rich, and another for the poor" perhaps has been hitherto more true of the English divorce law than of any other in the realm; but if the act is generously construed, the disability of poverty will be greatly mitigated.

Another point of doubt which the court itself will have to clear up is whether the act is retrospective, *i.e.*, whether a petitioner can plead acts of cruelty before 1938, or periods of desertion or insanity incomplete unless time has run from some date previous to that year. This is a matter of law, and for safety should go to the court of appeal or even to the House of Lords before any decree absolute is granted in such cases. The act is clear and definite enough, but judges require more than a simple affirmation before they will declare an act retrospective and so possibly disturb vested interests.

Occasionally a petitioner, usually a wife, will obtain a decree nisi, and, herself not desiring to remarry, then deliberately refrain from applying to have it made absolute, either because she wants more money than she thinks the court will grant her and hopes to make a bargain with her husband accordingly, or to prevent his remarriage. In such case the act provides that the respondent himself may apply for the decree nisi to be made absolute, and the court may exercise a discretion in his favour.

Sometimes husband and wife have drifted away from each other, and one may be ignorant whether the other is alive or dead. The old law was that after seven years of ignorance of (but not wilful blindness to) the other's continued existence, remarriage without fear of prosecution for bigamy was possible, but if the absent spouse returned, the second marriage was void. The act (section 8) provides for presumption of death and consequent dissolution of marriage in the case of an absent spouse. The petitioner must adduce "reasonable grounds" for supposing his or her spouse to be dead, but the burden of proof shifts after seven years of unexplained absence. This provision should be of great value to those classes who cannot afford the heavy expense of tracing a missing person. (See LAW AND LEGISLATION.) (A. FEL.)

**Docks and Harbours.** Important harbour and waterway improvements of the United States are usually carried out by the Federal Government through the Corps of Engineers, War Department, U.S. Army. About 1,000 projects were in force on June 30, 1937, with active operations under way on over one-third of the total. By the River and Harbor Act, approved August 26, 1937, Congress authorized addi-

tional improvements estimated to cost over \$50,000,000 at 133 localities in the United States and at eight harbours of U.S. island possessions or Alaska. Among the more important projects under way or authorized are the enlargement of the Cape Cod canal to a depth of 32 ft. and widths of 500 ft. or more, to provide a safer and more direct route for coastwise shipping than the exposed channels outside the Cape; deepening the main ship channel through New York harbour to West 59th street, Manhattan, to 45 ft. or more, to permit the safe and expeditious movement therein of the largest transatlantic liners; the deepening of the major portions of Staten Island sound and approach channels to 35 ft. for the accommodation of the largest oil tankers; enlargement of the Chesapeake and Delaware canal at 27 ft. depth for use by coastwise shipping between Delaware river points including the Port of Philadelphia, and Chesapeake Bay harbours including the Ports of Baltimore, Annapolis, and Norfolk; the deepening of the Sabine-Neches waterway, the Houston Ship channel, and certain other Gulf Coast channels to 34 ft., for the accommodation of heavily laden oil tankers; extensive deepening of the channels and anchorages of San Diego bay for both commercial and naval use; the construction of break-waters aggregating 5½ mi. in length for the protection of Los Angeles outer harbour, and the dredging of extensive areas in Los Angeles-Long Beach harbour to depths of 40 and 35 ft., for use by naval craft and commercial shipping; construction of a large dam and lock on the Columbia river at Bonneville, 39 mi. above the present head of deep-draft navigation at Vancouver, Wash., and dredging to extend ocean navigation on that stream to The Dalles, Oregon, 190 mi. above the ocean; the deepening of channels connecting the Great Lakes and of many of the more important lake harbours to permit full loading of large cargo carriers engaged in the iron ore trade; and continued extension of the shallow-draft protected waterways comprising the Atlantic and Gulf Intracoastal and Inland Waterway Systems for barge, tanker and pleasure boat traffic, including complete canalization of the upper Mississippi river to Minneapolis, Minn.

Terminal facilities were extensively improved and extended at many U.S. harbours. Typical are the new concrete pier of the Sinclair Refining Company on the Delaware river at Marcus Hook, Pa., which has a frontage of 1,000 ft. and water depths of 32 to 34 ft.; the 500-foot concrete wharf of the Alabama State Docks Commission at Mobile, for use in connection with a new cold storage warehouse; the concrete wharf and steel warehouse of the local navigation district at Brownsville, Texas; a new passenger and cargo terminal with modern fruit-handling equipment at Los Angeles harbour, and numerous others.

During the year the City of New York, under Federal supervision, placed in operation a foreign trade zone at which goods may be unloaded, stored, manipulated and reshipped to foreign points without payment of duties and without intervention of custom officials except under certain conditions. This zone is on Staten Island in New York harbour. It embraces five piers and six slips, each of 30 ft. depth, approximately 300 ft. width, and 1,025 to 1,090 ft. length. Authority has been secured for the operation of a similar zone by the Alabama State Docks Commission at the Port of Mobile; and preliminary consideration has been given the establishment of foreign trade zones at other harbours of the United States. (J. L. S.)

Much additional work has been created by the growing tendency, remarked in most countries, to concentrate trade in a few of the bigger ports. While this is an advantage in many ways, it brings obvious problems in labour, distribution, and safety in war-time; the last has caused particular concern in Great Britain owing to food supplies. The question of grouping ports all-round the British coast under a few big authorities has been raised but strongly opposed. That tendency, however, is increasing in many

countries, conspicuously Germany.

The year has been more remarkable for the starting or continuation of new schemes than for any striking technical development in port construction. Improved crane equipment, usually electric, has had to be provided, and the necessity for having air facilities as near to the port as possible has presented many difficulties in planning, especially in the older ports.

New schemes have been started all over the world. Some have been dictated by military or political considerations, *e.g.*, in Japan and her possessions, where an increasing number of areas are being screened from public view, and on the Italian Red sea coast, where the military demands of Abyssinia are obviously great. Great Britain is expected to start counter-works shortly.

The scheme to construct a huge new free port at Montier bay, on the south coast of Newfoundland, has been revived and is being considered. The bay is large, is ice-free and comparatively fog-free, while the port would provide the most direct cargo route between northern Europe and the greatest American trading area, clearing facilities for a huge entrepôt trade, and would be most advantageous for transatlantic air services. Against these factors the cost would be very high, and Port Churchill has taught caution by showing the difficulties of diverting trade from its normal channels. The principle of free ports is also a matter of argument, both in Canada and the U.S., where one is suggested at Boston, Mass.

The possibility of a large volume of shipping being diverted from the Suez route to that round the Cape of Good Hope, either for safety or to save canal dues, was one of the factors which decided the South African Government to launch a great improvement scheme at Capetown, where approximately £6,000,000 are to be spent on improving the docking and dry-docking facilities, reclaiming land for railway connections, etc. In the meantime, the Government is doing all that it can, by better facilities of all kinds and reduced rates, to make the Cape route attractive.

A big improvement scheme has been started in Montreal, partly due to the possibilities of Port Churchill in the grain trade of the future. The Argentine Government had published a huge scheme of port improvements at the end of 1936, and, as water is generally their great problem, had planned the building of 23 dredgers; owing to the increase in shipyard prices, only one of them was actually ordered.

In the Indian ocean, valuable improvements have been effected in Beira, Portuguese East Africa, for the benefit of the growing exports of its hinterland, and a five-year plan has been started for the modernization of Colombo (Ceylon), with special attention to the bunkering of coal and oil, in face of the growing competition of the South African ports.

On the continent of Europe, among the most interesting events during the year have been further steps in the organization and rationalization of German ports, the steady progress of the schemes of the Italian Government, particularly conspicuous at Genoa and Naples, and the improvements in the port of Calais, where the safety of shipping and the facilities for handling large quantities of cargo have received equal attention. The Polish Government proposes further great improvements at Gdynia, which, a small fishing village only a few years ago, has been developed into a great national seaport in a very short time, but which would be terribly vulnerable in the event of war in the Baltic. In this case, finance is the obstacle.

In the provinces of Great Britain and the Irish Free State, one of the most interesting projects is certainly that of Galway, still aspiring to an important position in transatlantic trade, where the scheme authorized by the Dublin Parliament in 1935 is now being put in hand. The contract for the first part has been accepted and is to be completed by 1939. Transatlantic liners are

still to handle their passengers by tender in the bay, but it will be possible at all states of the tide instead of during only six hours. Cargo steamers up to 6,000 tons gross will be accommodated in the dock.

Big dock-extension schemes are under way at Sunderland, with special reference to the coal trade, and on the Clyde the dredging operations demanded by the passage of the new Cunard-White Star liner to the sea—the anxiety about the passage of the “Queen Mary” was a lesson fully appreciated—have been combined with shrewd port developments in Glasgow and its satellite harbours. The abandoned shipyard site at Meadowside has already been bought for harbour extensions.

In Great Britain, however, the greatest interest is in the Port of London, where the authority has prepared a bill for Parliament permitting further borrowing to the extent of £12,000,000 for the modernization and improvement of the port.

Until the bill becomes law, the details of the developments in mind are not published, but the possibilities of the construction of a fourth dock in the “Royal” system, foreshadowed at the end of 1936, “when increased trade demands,” are widely discussed. This would lie to the north of the Royal Albert dock, partly over developed land and partly on marshes bought by the old dock company in the '50s.

In the whole world the two problems which have aroused the greatest attention have been dock labour and safety precautions with oil. Many concessions have been made to labour, with regard to pay, hours, and decasualization, but the year has seen a large number of strikes.

(F. C. Bo.)

**Dodecanese, The.** An archipelago in the Aegean, lying off the Turkish Asiatic coast and comprising 12 islands; taken from Turkey, by Italy during the Italo-Turkish war, 1912, Italian ownership being confirmed by the Treaty of Lausanne, 1924. Land area, 977 sq.mi.; pop., 134,650; the islands are ruled from Rhodes, the capital (pop. 25,400), by a governor subject to the foreign ministry.

Agriculture (grapes, olives, tobacco, etc.) and sponge-fishing are the principal industries; but the chief value of the islands today lies in their strategic position. From Leros, now a strong air-naval base, to Tobruk, Italy's eastern-most Libyan base (60mi. from the Egyptian frontier) is 390mi., and the submarine and air control of this line, especially if combined with similar control of the 270-mile line from Sicily to Tripoli, would give any Power attaining it a strangle-hold on all traffic from Gibraltar to the Suez canal.

**Dog Shows:** *see* SHOWS: *Dogs.*

**Dole,** the colloquial misnomer for the payments made to unemployed persons in Great Britain under the state contributory insurance schemes. From April 1, 1937, the “waiting period,” during which no benefit is paid at the beginning of unemployment, was reduced from six days to three, and an increase was authorized in the number of additional days' benefit that can be drawn after practically continuous employment for five years.

A parliamentary bill that received its second reading in Dec. 1937, provides for the inclusion of outdoor domestic servants (grooms, gamekeepers, chauffeurs, etc.) in the scheme, and for disposal of the surplus of the unemployment fund, which is expected to reach £82,000,000 by the end of 1938. About 13,500,000 persons are insured under the state scheme, the annual income of which is about £65,000,000, and the expenditure about £45,000,000. (*See* RELIEF.)

**Dollar, Purchasing Power of:** see PURCHASING POWER OF MONEY.

**Dominican Republic,** a West Indian republic occupying the eastern two-thirds of Hispaniola; language, Spanish; capital, Ciudad Trujillo (formerly Santo Domingo); president, Rafael L. Trujillo Molina. The area is 19,325 sq.mi. Population (1935 census) 1,478,121. It is predominantly mulatto and negro, but whites are politically important. The chief cities are: Ciudad Trujillo, the oldest city in America, 50,000; San Pedro de Macoris, 20,000, and Santiago de los Caballeros, 20,000. Since 1930 the country has been under the dictatorship of President Trujillo. During 1937 the Trujillo policy of material improvements was continued. The principal events were in connection with the disorders attending the expulsion of Haitians, which aroused considerable feeling between the countries and resulted in a Haitian request for an international investigation. This was opposed by President Trujillo (see HAITI). As the year closed, there were rumours of revolutionary activity in anticipation of the presidential elections of 1938. There are over 375 mi. of railways; the highway system has undergone extensive improvement and development. In 1935 imports (largely textiles, food-stuffs, and manufactured articles) aggregated \$9,790,053, chiefly from the United States (48.4%) and Japan (11.8%). Exports (sugar, 61%; cacao, 13.5%; coffee, 8%) totalled \$15,487,149, largely to Great Britain (47%), the United States (26.9%), and France (12%). The Dominican Republic is primarily agricultural, with sugar the most important crop, largely for export to Great Britain.

It is fourth in world production of cacao. The monetary unit is the peso, equal in value to the U.S. dollar. The national budget in 1936 was \$10,500,000, of which 9.4% was allotted to education. Fiscal control is in the hands of a financial adviser nominated by the president of the United States. In 1936, 947 primary and secondary schools had an enrolment of 104,882, with 13,500 additional students in 585 night schools. (L. W. BE.)

**Donations and Bequests.** The number of newly established foundations, endowments and trust funds organized for the benefit of the public has continued to grow during the year. Complete information is nowhere available as to the total now chartered, but they run close to 280. Upwards of 50 of these appear to be foundations in the sense in which the term was originally used, and thus having substantial endowments. About 25 have principal funds of \$10,000,000 or over.

Among the largest created during 1937 were: Charles Hayden Foundation, New York, for the education of young boys and young men and the advancement of their moral, mental, and physical well-being; funded at approximately \$50,000,000. Andrew Mellon Educational and Charitable Trust, Washington, D.C., for religious, charitable, scientific, literary and educational purposes, with large funds to come, but the amount not yet announced. Bache Foundation, New York, for the promotion and encouragement of art, and particularly for a public museum in New York, with funds reported as approximately \$15,000,000. George F. Baker fund, New York, for religious, charitable, scientific, literary or educational purposes; funded at approximately \$15,000,000. George and Frances Ball Foundation, Muncie, Ind., for religious, charitable, and educational purposes, with a fund probably less than \$10,000,000 as first reported.

Jane Coffin Childs Memorial fund for medical research, Yale university, for research into the causes and origins of cancer, with funds said to be in the neighbourhood of \$10,000,000. Zachary Smith Reynolds Foundation, \$7,000,000 to be used exclusively

in North Carolina to fight syphilis.

Among other smaller endowments whose capital funds were either unannounced or believed to be in smaller figures, were: Louis and Henrietta Blaustein Foundation, Baltimore, \$500,000 for charity, education and research; Clara Elizabeth fund, Flint, Mich., \$250,000 for attacking infant and maternal mortality; Dazian Foundation for medical research, New York; the Finney-Howell Research Foundation \$300,000 for the study of the causes and cure of cancer; Good-will fund, Boston, for charitable and educational purposes, approximately \$2,000,000 reported; Solomon R. Guggenheim Foundation, New York, for the promotion of art; and the Charles R. Walgreen Foundation, University of Chicago, \$550,000 for the study of American institutions.

The Southern Education Foundation was organized in July, 1937, with a capital of \$3,000,000 by consolidation of the former George Peabody fund, John F. Slater fund and the Anna T. Jeanes fund. Though chartered in 1936, the Alfred P. Sloan Foundation of New York, for research and education in economics, was endowed in 1937 with \$10,000,000 by Alfred P. Sloan, Jr.

An additional gift by F. S. Kresge of about \$12,500,000 to the Kresge Foundation was reported by its president; and other additions to existing foundations were made during the year. Notably among the latter were the funds added to the National Foundation for infantile paralysis by the celebrations of the President's birthday.

A few increments to the number of community trusts (*q.v.*), these being endowments held and managed by trust companies with disbursements of income directed by a committee partly made up of public officials, were noted in the year. Those which reported holding endowment funds totalled 28. (S. M. HA.)

**Doumergue, Gaston** (1863-1937), French statesman, who was president from 1924 to 1931 and twice premier, was born in Aigues-Vives, Aug. 1, 1863. At thirty years of age, he entered the Chamber of Deputies and rose to serve in the cabinets of Combes, Clemenceau, and Briand, himself forming a cabinet in 1913. As president, he followed an intransigent policy toward Germany. His administrative methods and philosophic attitude helped him to weather the fifteen cabinet crises which occurred during his presidency. He died on June 18, 1937, in his native town. For further details of his career, see *Encyclopædia Britannica*, vol. 7, p. 557.

**Drama:** see THEATRE.

**Dress:** see FASHION AND DRESS.

**Drinkwater, John** (1882-1937), British poet, playwright, and critic, whose greatest success was *Abraham Lincoln* produced in 1918. He scored again in 1929 with the comedy, *Bird-in-Hand*. Among his more recent books were *This Troubled World* (1933), *Summer Harvest* (1934), *The King's Reign* (1935), and his autobiography—*Inheritance* (1931) and *Discovery* (1932). He prepared the official programs for King George V's silver jubilee and King George VI's coronation.

He died in London, March 25, 1937. The reader will find an account of his career in the *Encyclopædia Britannica*, volume 7, page 664.

**Drought.** Each continent of the earth has within its boundaries one or more regions of such geographic position and topography that they are normally subject to periods of aridity or semi-aridity. In these regions droughts are not unexpected, although they vary in frequency, duration and intensity. During 1937 at least one droughty region of each continent, except Europe, experienced some degree of aridity or drought,

but throughout the world, droughts were not unusually numerous. Only in the northern Great Plains region of North America, in East-Central China, and in Morocco were droughts abnormally severe.

The prairie provinces of Canada suffered most acutely because of subnormal rainfall in the spring and early summer. Soil dried out and began drifting in Alberta and Saskatchewan before the middle of May. Some rain fell in Alberta about June 15, but Saskatchewan did not get relief from the drought until late in July, when general rains occurred. The most serious drought damage was inflicted on the wheat crop, although feed crops and the livestock industry of Alberta, Saskatchewan and Manitoba suffered generally.

In the United States, the 1937 drought was as critical but less extensive than in 1934 and 1936. High winds and a shortage of precipitation practically ruined most of the crops in 14 counties of North-eastern Montana and North-western North Dakota. Less critical, yet serious drought conditions prevailed in other sections of Montana and North Dakota, and in parts of Wyoming and much of South Dakota. In the southern Great Plains rainfall varied from 50% to 80% of normal and drought affected in varying degrees approximately 30,000,000 acres.

Argentina, Brazil and Ecuador in South America, experienced drought. Aridity in Argentina was not as intense as in 1935, but in combination with depredations by locusts and boll worms, was sufficient to reduce substantially both the cotton and wheat crops. Hardest hit were the areas around Buenos Aires and Cordoba. Several thousand square kilometres in three States of North-eastern Brazil were affected by severe drought early in 1937, while in Ecuador the aridity was reflected in a shortage of wheat at the end of the year.

A relatively hot, dry summer in East-Central and South-eastern Europe resulted in some crop reductions in the Danube basin and the Ukraine, but generally drought was not a serious problem on this continent.

During the first three months of the year parts of China experienced an acute shortage of rainfall. January wheat sowing was curtailed in North-eastern China and in the lower Yangtze valley. By March the drought in Sze-chuan province was termed the worst in the last quarter century. In South-eastern Honan province heavy losses of autumn and winter crops were recorded. Throughout the region peasants were threatened with famine and refugees concentrated in metropolitan areas. Rains in May served to ameliorate conditions, although the early drought resulted in a distressing food problem in Kweichow and Kwangsi provinces.

Prolonged drought created a serious situation in Northern Africa, particularly in French Morocco. Customary winter and spring rains failed to come. Seed failed to sprout, some oases dried up, palm and date trees withered, and cattle died, forcing plainmen to the hills. At one time the Government deemed it necessary to ban exports of wheat, barley and corn. Excessive drought in the North-western Sahara drove many caravans into French Morocco, and in Rhodesia aridity was held responsible for a substantial reduction in the tobacco crop.

Dry weather in Australia during June and July delayed wheat sowing in New South Wales and Victoria. By the end of September, a prolonged lack of moisture had caused deterioration of the wheat crop, although rains early in October brought some relief. (See also AGRICULTURE: *Drought and the Dust Bowl*; DRY FARMING; DUST STORMS.)

(H. H. BE.)

**Drugs and Drug Traffic.** In the surveillance of pharmaceuticals, proprietary preparations, crude drugs, veterinary products and the like that enter interstate or foreign commerce, the Federal Food and Drug

Administration during the fiscal year 1937 examined 7,536 samples of domestic drug products and 7,706 samples of imported drug products. As a result, 613 court actions were instituted. Of the shipments offered for entry into the United States, 1,359 were denied entry. The most common violations of the Federal Food and Drugs Act in commerce in drugs were false and fraudulent therapeutic claims and variations from pharmacopoeial or national formulary requirements.

During September and October of 1937 at least 73 persons died as a direct result of taking the drug known as "elixir sulphanilamide," which was manufactured in Bristol, Tenn. Twenty other persons who took the "elixir" died, but it was not established that this drug was exclusively responsible. The lethal effect of the "elixir" was due to its content of diethylene glycol, which was used as a solvent in making a liquid preparation of sulphanilamide, usually administered in tablet or powder form. Sulphanilamide itself is a valuable drug and was not responsible for the disaster. The Federal Food and Drugs Act does not require that new drugs be tested before they are placed on sale, and the manufacturer made no tests for the effects of the "elixir" on human life. Since the Federal act contains no provision against dangerous drugs, seizures had to be based on a charge that the word "elixir" implies an alcoholic solution, whereas this product was a diethylene glycol solution. All of the product that was not consumed has been accounted for and removed from the market by Federal or State seizure or by other means.

Efforts have been continued during the year 1937 for a more adequate food and drug law. Senate bill 5 passed the Senate in March, and at the close of the year was pending before the House Committee on Inter-State and Foreign Commerce. Other food and drug bills have been introduced in both the Senate and the House. Efforts will be continued until a measure fully adequate to consumer protection has been enacted.

(W. G. CA.)

**Drunkenness:** see INTOXICATION, ALCOHOLIC.

**Dry Farming.** The type of agriculture known as dry farming, developed to conserve moisture for crops in subhumid regions of about 15 to 20 inches of rainfall annually, has become an effort not merely to save moisture, but to conserve the population in the U.S. Great Plains area. At the beginning of 1937 this region had a population of 5,877,000 less than that of 1910 and 235,000 below that of 1935, owing to repeated droughts since 1930. Up to 1938 the Soil Conservation Service of the U.S. Department of Agriculture had instituted strip-cropping on 1,000,000 ac., and other improved, dry farming practices in its far-reaching program to rehabilitate and stabilize dust-blown farms and ranches. Strip-cropping is a method of planting alternate, narrow strips of soil-binding crops, such as grain sorghums, between narrow strips of ordinary field crops, such as wheat. Even the method of harvest is made to provide protection against wind and water erosion, for in severely eroded areas only the heads of the sorghums or other grains are harvested and the entire stalk is left standing as a windbreak. In districts of less severe erosion shorter stubble of eight to twelve inches suffices. The old type of dry-farm listing is being replaced with basin-listing, which is more effective in preserving moisture and preventing erosion. At Delhart, Texas, once called the "Heart of the Dust Bowl," the Conservation Service made a demonstration project of 28,765 ac., of which 25,025 ac. have now been stabilized against wind erosion. Many other demonstration projects are being carried on throughout the Great Plains and effort is being made to restore native, soil-binding grasses to a great part of the area and adjust livestock farming to conditions. (See also SOIL EROSION AND SOIL CONSERVATION.)

(S. O. R.)

**Dry Ice:** see CHEMISTRY, APPLIED.

**Dust Storms** may or may not represent land damage, according to their source. In inhabited regions, they are likely to be the manifestations of soil erosion by wind on agricultural land. In generally uninhabited regions, such as deserts and scab lands, the dust storms may represent only the aerial redistribution of soil particles from one locality to another, without any particular attendant damage. Wherever they occur dust storms are a symbol of aridity and a corollary of drought, for dry, powdery soil or sand is a prerequisite of a dust storm.

In arid or semi-arid agricultural regions, such storms tend to follow the removal of vegetation which normally protects and ties down the soil. In desert regions and other areas of arid climate and scant vegetation, the storms are virtually seasonal occurrences. In regions of either type, however, they vary with the velocity of the wind and the intensity of drought. Thus, a combination of unprotected dry soil, wind, and prolonged aridity normally may be expected to produce a dust storm.

In the prairie provinces of Canada dust storms in the spring of 1937 were among the first visible symbols of concurrent drought and cultivation. At intervals, the storms continued into the summer, and at times attained a velocity of 50 miles per hour.

The Northern Great Plains of the United States were subjected in 1937 to some of the worst dust storms in the history of the region. On May 28, visibility in parts of Montana was reduced to less than 50 feet and wind velocity reached gale proportions. From the first of January to the first of October the State experienced local or general dust storms on 68 days. In North Dakota 399 dust storms occurred in 40 days from February to September inclusive, while 72 days of dust blowing were reported in South Dakota from January to September, inclusive. In the Southern Great Plains region of the United States, at Goodwell, Okla., 102 dust storms were recorded during the year ending June 30, 1937.

Yellow-coloured dust storms were again a fairly common occurrence in the drought areas of China, as were the dust and sand storms blowing from the Mongolian desert.

Rains shortly after the middle of January in Australia ended a prolonged drought and stifled the seasonal dust storms. On the continent of Australia, dust storms are characteristically red in colour and originate for the most part on pasture and range land rather than on cultivated land.

The northern half of the Anglo-Egyptian Sudan, the Sahara and other arid or desert regions of Africa again experienced severe sand and dust storms, though these were not unexpected, since such storms have become periodic in these regions.

In other parts of the world less severe and less frequent dust storms were reported, their intensity and frequency varying with the intensity of drought and the degree of agricultural activity. Length of agricultural occupation is almost invariably a determining factor in the potentiality of dust storms in a given drought region. (See also AGRICULTURE: *Drought and the Dust Bowl*; DROUGHT; DRY FARMING.)

(H. H. BE.)

**Dutch Borneo:** see BORNEO.

**Dutch East Indies,** the largest colonial possession of the Netherlands, consists of a huge archipelago, with several large islands, Java, Sumatra, Celebes, parts of Borneo and New Guinea, and many smaller ones, lying along the Equator from 6° north latitude to 10° south latitude, located south of the Philippines, south and east of the Malay peninsula and north of Australia. Capital, Batavia; governor-general, Jonkheer Dr. A. W. L. Tjarda van Starkenborch-Stachouwer, appointed 1936. Area is 733,681 sq.mi.; population (1930) 60,731,-

025; estimate Jan. 1938, 65,000,000. The population (census, 1930) is divided as follows: Java and Madura, 41,719,524; Sumatra, 8,238,570; Borneo, 2,194,533; Celebes, 4,226,586; rest of the archipelago, 4,351,812. Largest cities: Batavia, 437,000; Surabaya, 313,000; Bandung, 167,000.

**History.**—Dutch rule in the East Indies had its origin in the trade activities of the United East India Company, which began in the 17th century. Although the purposes of this organization were commercial it acquired a substantial grip on many coastal districts as a result of wars and negotiations with local rulers. The bankruptcy of the East India Company in 1798 led to the taking over of the administration by the Netherlands Government. The authority of the Government was gradually established over the entire vast archipelago during the 19th century. At the present time laws are promulgated by the governor-general with the consent of the Volksraad (legislative assembly), which consists of sixty members and a president. The latter and half of the members are Dutchmen; the other members are representatives of the native population. While the more populous and developed islands are administered directly, the system of indirect government, with Dutch advisers appointed to native potentates is widely employed in the so-called outer islands, such as Borneo, Celebes and New Guinea.

**Trade and Communications.**—The trade of the Dutch East Indies in 1936 was valued at 551,560,000 florins for exports and 281,874,000 for imports. There were 4,416 miles of railways, 3,368 in Java and 1,019 in Sumatra and at the end of 1930 there were 35,900 miles of highways. Commercial aviation, which began in 1924 with an experimental flight between Batavia and Amsterdam, has expanded until aeroplanes travel more than 500,000 miles annually (in 1936) and carry more than 14,000 passengers, 50,000 pounds of mail and 150,000 pounds of freight. The Dutch East Indies, especially Java, is rich in natural resources and has been intensively and efficiently developed. Among the main products are sugar, petroleum, tin, rubber, pepper, quinine, oil palms, tea and coffee. The sugar industry has experienced a serious crisis because of the growth of nationalist economic measures; output declined from 2,843,000 tons in 1930–31 to 625,000 tons in 1935–36 as a result of Government restrictive measures.

**Finances and Banking.**—The unit of currency is the Dutch florin (55.6 American cents in 1937). The Java bank is the bank of note issue for the Dutch East Indies and there are several other banking institutions. Revenue in 1937 was estimated at 437,125,343 florins and expenditure at 461,564,145 florins.

**Education and Religion.**—The great majority of the natives of the Dutch East Indies are of Malay stock and profess the Mohammedan religion. The total number of schools carried on in native languages in 1928 was 17,611, attended by 1,513,085 pupils. There were 786 Dutch language schools, with 146,275 pupils (37,599 Europeans, 81,281 natives, and 27,395 foreign orientals—mostly Chinese). In Java and Madura (1920) 6.5% of native males and 0.5% of native females could read and write. A colonial army of about 40,000, mostly natives with Dutch in the higher commanding posts, is maintained.

**Dutch Guiana:** see SURINAM.

**Dutch Literature.** For Holland, 1937 was the Vondel year, in which was commemorated the 350th anniversary of the great poet's birth. In Holland and in the Dutch Indies his plays were produced, his poems recited, and his memory appropriately celebrated. Feb. 1937 marked the 50th anniversary of the death of Dekker ("Multatuli"), the

18th century writer, a study of whom has been brought out by Dr. Julius Pée. Holland lost two prominent literary men during the year 1937; Albert Verwey, poet and critic; and Slaverhoff, poet of the sea.

The year saw the publication of about 300 novels, 300 translated novels, 70 volumes of poetry, 50 plays, and more than 200 children's books.

Among the numerous poems, the following may be cited: Bloem's *De Nederlaag*, van Genderen-Stort's *Rym proeven*, Verhoeven's *Maskers*, de Vries' *Nergal*, Engelman's *Het Bezegelde Hart*, Hélène Swarth's *Wijding*, van Duinker's *Hart van Brabant*, Gerhardt's *Laagland*, de Mérode's *Ruischende Bamboe*, van Oosten's *Glorie des Harten*, and Japiks' Frisian poems. There have been anthologies collected by Dirk Cosler (the child in poetry), by de Groot (Christmas poetry), by Gysen (Flemish poems), and by de Molenaar (anthology of world poetry).

Essays and criticism have not appeared except in periodicals, apart from collected essays by Greshoff, entitled *Rebuten*, and Verumeus Bruning's *Ik Zie, Ik Zie, Wat Gij niet ziet*, a delightfully written book about Dutch ancient monuments.

In fiction, two historical novels should be mentioned: van Praag's *Minnares in Ongenade* and van Zeggelen's *Een hofdame uit de 18<sup>e</sup> eeuw*. Bordewijk wrote *Wingerdrant*, Vestdijk *Het Vijfde Zegel*, Fenna de Meyier *Doolhof*, and A. M. de Jong *Het Cose gerucht*. Anne de Vries had a delightful children's book in *Bartje*. Van Randwyk considered unemployment in *Burgers in Vood*, Servaes' *Sonja* centres on prison life, and Schröder's *Studentencocktail* deals with students' life. There were novels about doctors, life in the country, the film world, life at sea, (cf. in this category, Hertog's *De wilde schuit* and de Geus' *De wilde vaart*), and regional life (cf. Coolen's *Kerstmis in de Kempen* and Theun de Vries' *Stiefmoeder Aarde*). There were no war novels. Louis de Bourbon published *Vrouwen*, a good collection of short stories. The poet Marsman brought out a novel, *De Dood van Angèle Degroux*. Helman's *Aansluiting gemist* deals with the present situation in Spain. Du Perron wrote about Java in *Het Land van Herkomst*. Periodical literature was vitally alive. The reviews number about 1,000. (S. L. EN.)

## EAMES, Wilberforce

(1855–1937), bibliographer of the New York public library, was born in Newark, N.J., Oct. 12, 1855. While still young, he displayed an

exceptional interest in books which won the attention of scholars despite his brief scholastic training. Beginning his library work in 1885, he secured a reputation as America's leading bibliographer. His work involved study of many rare tongues and included innumerable bibliographical studies. Appointed librarian of the New York public library in 1892, he became bibliographer in 1916, holding

LAST PICTURE of Amelia Earhart and her navigator, Frederick J. Noonan, taken at Batavia, Java, and radioed to the United States just before their plane was lost in the Pacific

PLANE in which Amelia Earhart and Frederick J. Noonan were lost in the Pacific while trying to reach Howland island in an around-the-world flight

the post until his death in New York city on Dec. 6, 1937.

## Earhart, Amelia

(1898–1937), American aviatrix, who was lost in the Pacific ocean during a round-the-world flight starting from Miami on June 1, 1937. Despite an extensive search by army and navy searchers, no trace was found of the flyer or her plane. Born July 24, 1898, she had successively been a nurse in Canada during the World War, a research worker, social worker, flyer, editor, and lecturer. She established the following aviation records—first woman to fly the Atlantic, to fly the Atlantic alone, to fly an autogiro, to cross the United States in an autogiro, to fly non-stop across the United States, to fly from Hawaii to the United States. In 1931, she had married the publisher, George Palmer Putnam.

**Eastern Island:** see MIDWAY ISLANDS.

## Eastern Orthodox Churches.

In the Near East in 1937, the number of Orthodox Churches was increased to 13 by the establishment of the Church of Albania, which had hitherto formed part of the Oecumenical Patriarchate; its primatial see is Tirana.

The appointment of an archbishop of Cyprus has not been possible, owing to the deadlock between the Government and the Cypriote Church which has existed since the death of the last archbishop in 1933.

The exact position of the Church in Russia cannot be ascertained, but repression by the Soviet régime is reported to be lessened. The Metropolitan Sergei, who has acted as *locum tenens* of the Patriarchal Throne since the death of the last Patriarch in 1925, has been canonically appointed Metropolitan of Moscow. The Russian Church in Exile has lost by death the Metropolitan Antony of Kiev, who was notable as a religious reformer in Russia before the World War; the Metropolitan Anastasy has succeeded him as president of the Council of Russian bishops.

Under the leadership of the Patriarch Miron, a vigorous evangelistic campaign has been sustained throughout Rumania and especially in Bucharest; similar work, carried on for some years by "Zoe," a lay and clerical society, has had much success.

In Yugoslavia, the opposition by the Orthodox Church to the Concordat concluded between the Government and the Vatican in 1935 led to a serious political position. On July 23, 1937, the bill ratifying the Concordat was passed by the Skupština; on the 24th, the Orthodox Patriarch Varnava died suddenly in Belgrade; and on the 25th, the bishops excommunicated the premier and all ministers and members who had voted for the ratification. In

August the Croats, the chief Yugoslavian Catholic group, themselves rejected the Concordat, and two months later the situation was eased by its being indefinitely postponed.

During 1937, delegates approved by all the Orthodox Churches (excluding the Russian Patriarchate) took part in the World Conferences at Oxford and Edinburgh. The close relations between the Orthodox and the Anglican communions has been strengthened, especially by the exchange of students arranged by the Church of England Council on Foreign Relations. It is noteworthy that Anglican students sent to Rumania have been admitted to sacramental communion by the Rumanian Church.

**East Prussia**, a province of Prussia and the German Reich lying south of the Baltic between the Vistula and Niemen rivers. Area, 14,283 square miles. Pop. (1933) 2,333,301, density 163 per square mile. By the Treaty of Versailles in 1919 East Prussia was cut off from the rest of Germany by the intervening so-called Polish Corridor. This has caused much friction between Germany and Poland; the Germans complain that the Polish railways do not furnish adequate and satisfactory transit facilities across the Corridor; the Poles have complained at times that they have not been properly paid for hauling German trains. To improve communications Germany has placed excellent new steamers in service between Stettin, Danzig and the East Prussian capital of Königsberg. Here in Königsberg is held an annual eastern fair at which some foreign nations exhibit; it also serves as an economic link between East Prussia and Germany and a good opportunity for displaying the products of the German four-year plan.

East Prussia is a region of great landed estates, owned and operated by the landed aristocracy known as Junkers. It was a constant demand of the Socialist and Catholic parties after the war that these estates should be broken up into small farms for the German unemployed. President von Hindenburg, himself the owner of a large East Prussian estate, steadily refused to approve this desirable agrarian reform, and thereby contributed to the downfall of the Brüning, Papen and Schleicher cabinets. This reform was part also of Hitler's program, but the Nazis have done little to carry it out. The Nazi district leader of East Prussia, Erich Koch, aims to establish industries in East Prussia, and so bring about a more healthy balance between agriculture and industry.

(S. B. F.)

**Economic Association, American:** see AMERICAN ECONOMIC ASSOCIATION.

**Ecuador**, a South American republic situated astride the Equator on the Pacific; language, Spanish; capital, Quito; provisional president, Alberto Enríquez. The area, including the Galápagos islands (2,400 sq.mi.), is 337,392 sq.mi., according to Ecuadorian claims, but approximately 100,000 sq.mi. is disputed with Peru (see PERU). The population was officially estimated at 2,554,744 in 1932, but more reliable later estimates give 3,414,106 in 1935. The chief cities and estimated populations in 1932 are: Quito, 140,000; Guayaquil, 120,000; Cuenca, 42,000; Riobamba, 21,200.

**History.**—Under the government of a junta headed by Federico Páez, which came into power in 1935, Ecuador has attempted an extensive program of reforms. The budget for 1937 was the largest in many years, with heavy outlays for national defence, public education, and public works and communication. Special efforts were made to advertise the country and to attract tourists. On Aug. 10, a constituent assembly met to consider needed reforms of the Constitution of 1906. This assembly formally named

Páez provisional president of the country and began consideration of constitutional changes. Meanwhile, the Government sternly repressed adverse criticism, closing newspapers and refusing to permit exiles to return to the country. As internal unrest continued, President Páez was compelled to resign (Oct. 24) and was succeeded by War Minister Alberto Enríquez. President Enríquez promptly dissolved the constituent assembly and announced a formal investigation of governmental affairs and the purge of those who had "abused power." The feature of Ecuadorian foreign relations in 1937 was the attempt under the auspices of the United States to adjust the century-old boundary dispute with Peru.

**Trade and Communication.**—Ecuador has external communication by sea (almost entirely through Guayaquil) and north and south by air. In 1937, preparations were made for the opening of air service to all sections of the country. Ecuador has about 600 mi. of railroad. In September contracts were let for an eight-year program of highway development, under which 15 trunk highways are to be built. Imports in 1935 totalled 97,094,000 sucres in value, exports, 113,498,000; in the first ten months of 1936, they were, respectively, 114,792,006 sucres and 87,650,016 sucres. The leading items of import are textiles, machinery, electric machinery and implements, motor vehicles and accessories; the leading exports are: cacao, ores and gold dust, crude oil, and coffee. The United States leads in exporting to Ecuador, supplying 28.9% in 1935 (with Japan 17.6%, Germany 14.1% and Great Britain 12.7% next in order) and in imports, taking 46.6%. United States trade with Ecuador for 1936-37 showed a 16% increase. Negotiations for tariff reciprocity with the United States were begun in 1937.

**Finances and Banking.**—The monetary unit is the sucre whose international exchange value sharply declined to 7.2 (U.S.) by the close of 1937. The budget for 1937 calculated expenditures and revenues at 79,500,000 sucres.

**Education.**—In 1935 Ecuador had 2,239 elementary schools, 21 secondary schools, and four universities, with elementary and secondary enrolments of 181,638 and 5,589. For 1936 the budget allotment for education was \$1,573,675; for 1937, \$1,645,270 out of \$8,745,000, more than ever before allotted. The army has approximately 6,000 men, the navy 500 men. (L. W. BE.)

**Eden, (Robert) Anthony** (1897— ), British secretary of State for foreign affairs, second son of Sir Wm. Eden, Bt., was educated at Eton and Christ Church, Oxford. After service in the World War (1915-19), he contested the Spennymoor division in 1922, and in the following year was elected for Warwick and Leamington, which he has since continued to represent. From being parliamentary private secretary to Sir Austen Chamberlain (1926-29), he became under-secretary for foreign affairs, and in 1934 was made lord privy seal and a privy councillor. In June 1935, he entered the cabinet as minister for League of Nations affairs, holding this post until the following December, when he succeeded Sir Samuel Hoare at the foreign office. In Jan. 1937 he concluded the "gentlemen's agreement" with Count Ciano, the Italian foreign minister concerning the situation in the Mediterranean. At Geneva, in May, he welcomed Egypt into the League of Nations, and in the same month sat with representatives of the Dominions, who came to London for the Imperial Conference. At Geneva again in September, he delivered an important pronouncement on Palestine, and took part in a world-wide broadcast by leading European and American statesmen on world economic co-operation organized by the American National Peace Conference. Later in the month Mr. Eden represented his country at the Nyon Conference, convened by Great Britain and France to discuss

the attacks (arising out of the Spanish civil war) on merchant shipping in the Mediterranean.

In November Mr. Eden represented Great Britain at the Nine-Powers Conference (*q.v.*) on the Japanese attack upon China. At the end of the same month, together with Mr. Chamberlain, he met in London and came to a cordial agreement with Messrs. Delbos and Chautemps on the situation in Spain, Germany's demand for colonies, and other matters.

**Education.** Significant developments in education in the United States in 1937 include the rapid rise of enrolments in secondary schools; increase in enrolments in the colleges and universities; substantial increases in State appropriations for education and in Federal appropriations for the Land Grant colleges and for vocational education; the large number of school and college buildings erected through aid from the Public Works Administration of the Federal Government; and the promotion of adult education, through the Works Progress Administration of the Federal Government, including a variety of courses in art, music, the drama, and other subjects. Other developments that should be noted are the persisting decrease in enrolments in elementary schools in proportion to the general population of the United States; the continued use of the radio in adult education; the extension of radio educational broadcasts; and the advancement of standards in the pre-service preparation of teachers. Several States during the past year began to require for teachers a minimum of four years beyond high school graduation. About a dozen of the States and the District of Columbia have established such standards for licences to teach in both elementary and secondary schools. The "Forum Movement" gained considerable headway during the year, in large part through the energetic leadership of Dr. John W. Studebaker, the United States commissioner of education. Almost numberless books and much periodical literature appeared on various educational subjects during the year.

**The Educational Policies Commission.**—The work of the Educational Policies Commission was significant. This commission, created in 1936 and composed of more than a score of distinguished American educators, appointed by the National Education Association and the Department of Superintendence (now the American Association of School Administrators), seeks to take a comprehensive view of American life to determine the essential responsibilities of education, and to state how these responsibilities can best be met. The commission has been engaged in considerable research and has published important documents, among which are *The Unique Function of Education in American Democracy*, prepared in collaboration with Dr. Charles A. Beard and *Research Memorandum on Education in the Depression*, prepared by Dr. F. B. Sears. Other important publications are soon to appear. It is the belief of the commission that its work will be effective in proportion to the degree to which the educational profession in the United States is brought into the task of formulating pronouncements and securing their practical acceptance. Assisting the commission as consultants *ex-officio* are 2,200 officials of educational and regional organizations, who constitute an effective co-ordination between the profession and the public.

During the year the non-professional graduate schools of Harvard, Yale, Princeton, and Columbia began a co-operative experiment in examinations for the purpose of gaining an estimate of the academic achievements of entering graduate students in the more important fields of learning. This experimental step was not designed to effect the membership of students in these graduate schools but to determine the value of carefully prepared questions (of the short-answer or objective type) as aids to the students and to their advisers and teachers in regard to the

aptitude and the preparation of the students for graduate work in the non-professional schools. The examinations were the same in all the four institutions, except for options in language. The experiment is regarded by some observers as an important development in higher education.

Important during the year was the experiment of the Progressive Education Association through its commission on the relation of school and college. This commission, composed of school and college representatives concerned with the problem of this relation, was formed seven years ago to study changes which seemed to be most needed and to develop co-operation in an effort to make the work of both the schools and the colleges more meaningful to the students in each. In 1937 the work of the commission was developing in at least five general directions; greater continuity in the curricula; better integration of the subject matter; more satisfactory adaptation of the work of the schools to individual capacities, needs, and interests; more vital subject matter; and more extensive use of the communities in which the schools are located.

**Secondary Education.**—Also important was the co-operative study of secondary school standards which is directed through representatives of the six regional associations of secondary schools and colleges in the United States. The purpose of this study, which made considerable progress in 1937, is to make more vital and less mechanical accreditation procedures, to make them more stimulating, more adaptable to the individual differences of students, and more broadly comprehensive and less narrowly academic. Much experimentation was made in an effort to apply and validate criteria and procedures in many representative secondary schools in all parts of the country. In process now is the work of analysis and evaluation of the results of experimental materials, to be followed by a report containing recommendations for programs of the various regional associations.

Interest in the problems of secondary education in the United States was especially revealed in 1937 in the wide discussion of the report of the committee on orientation of the department of secondary school principals of the National Education Association, entitled "Issues in Secondary Education," which was issued in 1936. This report is considered a significant contribution to educational philosophy and highly important in the development of secondary education. The report grew out of the beliefs (1) that the full realization of democracy in the United States required greater effectiveness in secondary education; and (2) that this effectiveness should be made through a program of secondary education more closely related to the realities and problems of modern American life.

**Proposed Federal Aid.**—An interesting development in education during the year was the increased and increasing interest in Federal aid for general education in the various States. This proposal, which has been widely discussed in this country for many years, at present appears in what is known as the Harrison-Black-Fletcher bill, now before Congress. It provides for an initial appropriation of \$100,000,000 and an annual increase in the sum of \$50,000,000 until the appropriation reaches \$300,000,000 in the fifth year, that appropriation to continue annually thereafter. The money is to be used by the States for the promotion of a program of public education, the manner in which it is to be used to be left to the various State legislatures. Control or supervision of State schools or State school systems by the National Government is expressly prohibited in the bill. Under its provisions a State, in order to participate in the Federal allotments, must maintain its school system for at least 160 days during each year, except when suspended because of epidemics, fires, or "acts of God"; and it must spend annually from public revenues, State or local or both, as much per child between the

ages of five and 20 years as was spent in 1934. The bill provides that the distribution of the annual allotment for each State is to be in proportion to the population between those ages, based on the census reports, and without discrimination. Advocates of the bill are hopeful for its early passage.

In June of 1936 President Roosevelt appointed an Advisory Committee of 18 people to study the subject of Federal aid to vocational education. This committee was enlarged to 23 in June of 1937 and instructed to study the broader questions of Federal relationships to all kinds of education in the United States, the report to be made before the end of the year. Educational leaders throughout the country viewed the news of President Roosevelt's action as evidence that their efforts to gain Federal aid for schools had enlisted his interest in the subject.

**Horace Mann Day.**—Of wide interest in the United States this year was the celebration of the 100th anniversary of the establishment of the secretaryship of the Massachusetts Board of Education. This centennial, observed in numerous places throughout the country, has served to draw fresh attention to the work and influence of Horace Mann, who is regarded as the father of public school education in the United States. The period from Nov. 7 to Nov. 13, designated as "American Education Week," witnessed the climax of this year-long observance, with Nov. 9 as "Horace Mann Day." Thousands of citizens honoured his memory and read the story of his work for public schools.

A radical departure in higher education appeared in an experiment announced this year at St. John's college, Annapolis, Md. The new program of study at that institution is not a college "course," as that word is ordinarily used in the United States. Nor is it a group or number of courses, either required or elective. An entering student may take either the old or the new program, which is a complete and integrated curriculum that extends over four years. Once selected, however, the student will be required to take the new program in its entirety. Comprehensive and general, this is designed to afford ample opportunity for the individual interests and capacities of the students and to lead to the degree of Bachelor of Arts. The program, opened to freshmen who entered the institution in the autumn of 1937, is based on a hundred or more "great" books of the intellectual tradition of the western world. Columbia college in New York city announced during the year a general course in the humanities to be required of students in that institution. Apparently the tendency generally in the United States is toward more general rather than specialized education, in higher institutions. Interest continued also during the year in the reconstruction of the curricula in elementary and secondary schools, with numerous books and considerable periodical literature appearing on the subject.

The Southern Association of colleges and secondary schools created a Commission on Curricular Problems and Research to plan and direct a study of the secondary schools and colleges that are members of the Association. The study, in part similar to that of the Progressive Education Association and other regional organizations, is designed to develop an educational program that will more adequately meet the needs of adolescent youth in the Southern section of the United States. This experiment was approved as an enterprise of the Association in 1937, and will probably continue for five years or longer. Under the experiment secondary schools and colleges will be encouraged to modify their present instructional programs so as to provide for desirable outcomes that are not now being achieved by the secondary schools.

Public pronouncements by President Robert M. Hutchins, of the University of Chicago, during the past few years, particularly *The Higher Learning in America*, which appeared in 1936, led during 1937 to wide discussions of conditions in higher education and drew lively attention to the growing movement to reorganize

undergraduate materials and methods of instruction. Many reviews and critiques appeared on this issue.

A significant development in education in the United States during the past year has been the work of the American Youth Commission of the American Council on Education. This commission, formed two years ago but with most of its active work to date done in 1937, gave much attention to the problem of the vocational adjustment of youth and the responsibility of school and the public employment agencies and employers of labour and labour itself in dealing with these problems. At its meeting in October the commission approved a large plan of experimentation between the schools and the United States Employment Service. (See SECONDARY EDUCATION.)

**BIBLIOGRAPHY:** *Journal of the National Education Association of the United States for 1937* (monthly except June, July and August). Various publications for the Office of Education, United States Department of the Interior. (E. W. K.)

**British Empire.**—Besides being a federation of countries for utilitarian purposes, the British Commonwealth of Nations has its basis in the unity of descent and of cultural and historical traditions. In education the same traditions which moulded the systems of England and Scotland were at work in all the English-speaking Dominions. The interplay of religious and secularist factors, the rivalry between voluntary effort and State intervention ran on similar lines, but the difference in territorial distribution, the relative importance of Catholic, Anglican, or Puritan influences and the presence of the problem of bilingualism tended to differentiate the systems. Gradually the Dominions have developed their own traditions more in keeping with their needs. At first sight there may seem little in common between the centralized and secular system of Australia and decentralized and partly denominational system of Canada; or between Catholic Quebec and Calvinist South Africa. Yet the basic principles of their educational systems are similar. The belief in the democratic principle of equality of educational opportunities and in tolerance towards political and religious dissenters is common to all. After the War, this community of ideas became more consciously recognized. The appearance of new post-War political philosophies challenged the democratic traditions of the British Commonwealth and led its members to revise their educational systems and to plan them more systematically, so that a common British philosophy of education is gradually emerging through the mutual influence of Great Britain and the Dominions.

To bring out this community of purpose, a mutual recognition is enough. Lately the collaboration of the members of the Commonwealth in educational reform has become more pronounced. The Hadow report of 1926 has influenced the Dominions, and new democratic societies outside of England have changed the attitude of England. The development of the London Day Training college into the Institute of Education as the educational clearing house of the Commonwealth and the collaboration of the Dominions in the *Year-Book of Education* started by Lord Eustace Percy in 1932 are visible signs of this new tendency.

During the past years all the members of the Commonwealth were more active in the revision of their programs and reorganization of their school systems. There is a common tendency to rebuild the systems on horizontal lines with three stages: primary, intermediate, and secondary, which would roughly correspond to the psychological stages of growth. The traditional conception of secondary education as a preparatory step to academic professions gives way to a more comprehensive view, which includes technical and vocational education as well. Indeed, the division into general and technical education is considered to be obsolete and the new programs try to bridge the traditional gulf.

For administration and finance the extreme decentralization and

one-teacher schools are gradually superseded by the organization of rural districts into larger units and consolidation of small schools. The methods are also reformed, and the ideas of the "active school" and individual approach are gaining ground.

**Canada.**—In Alberta, the most important features of the past two years were: (a) the introduction of the new enterprise or activity system of education in the elementary schools, (b) the beginning of an "intermediate school" organization, and (c) the reorganization of the administrative rural units into larger groups of schools called "divisions." More than 800 one-school districts have been consolidated.

In New Brunswick, the first minister of education was appointed in 1936. Since 1932, the problem of consolidating the rural districts was in the fore-front. The superintendent in his last report (1937) recommends a less rigid and more elastic course of study, with fewer compulsory and more elective subjects.

In Nova Scotia, the new programs for the Junior high school were introduced in 1935. New programs for the Senior high school are also being gradually adopted. New subjects, including music, art, manual work, commerce, and industry were admitted as valid for the Provincial high school certificate.

**Australia.**—In New South Wales, legislation is being prepared for the reform of technical and general post-primary education.

The Australian Council for Educational Research, founded in 1929, arranged an international conference in 1937 under the auspices of the New Education Fellowship. In May 1937, the meeting of Australian ministers and directors of education passed a resolution in favour of raising the school age to 15 years to operate from 1940.

**New Zealand.**—During the years of depression, the lower limit of school-age was raised to six years. One of the measures of the new Government in 1936 was the re-admission of five-year-olds to public schools. The Government has decided to raise the school age to 15 years.

In *Transvaal*, a commission was appointed in 1936 to investigate the system of the province. The conference at Pretoria in 1936 approved the principle of centralization of rural schools and in 1937 the schemes were in operation in 12 areas. In each a central school with hostels is to be established. Special school farms were opened by the department.

In the Orange Free State, the raising of the limit of compulsory attendance to 16 years was recommended by the director in 1937.

**Ireland (Eire).**—The gradual introduction of Irish as the medium of instruction is continuing, and at present more than half the secondary schools and almost all primary schools use Irish. Apart from this reform, important changes indicate the general reconstruction of the school system. Small rural schools are being eliminated through amalgamation, the curriculum of secondary schools is losing its previous rigidity with the introduction of new selective subjects. In primary schools the introduction of rural science as an optional subject is also a sign of the general tendency.

**British India.**—The most important problems of education in India are the wastage and stagnation in primary schools and the overcrowding of secondary and higher education. As the last *Report on Education in India* (1936) points out, only 26% of boys attending primary schools attain literacy.

The two British experts (A. Abbott and S. M. Wood), invited by the Indian Government, published their report in 1937; among their suggestions were the following: (a) infant classes should be entrusted to trained women teachers, (b) the education in primary schools should be based more upon the natural interests and activities of young children, (c) the curriculum of the rural middle schools should be closely related to the children's environment, (d) the vernacular languages should be the medium of instruction throughout the secondary stage, (e) manual work should be part of the curriculum of every school. The necessity of these reforms is generally recognized, and in Punjab rural science was introduced in vernacular. Middle schools and some schools have taken up petty crafts and industries, floriculture and tree-planting. With the exception of Punjab and United Provinces the middle schools of India are as a rule English-speaking. The introduction of compulsory attendance is proceeding slowly, and in Madras 71% boys and 28% girls of school age (6-11) attend schools. For British India as a whole, the percentages are only 50 and 17 respectively.

Abbott and S. M. Wood, *Report on Vocational Education in India* (1937).

(N. HA.)

**The World.**—The world movement for improved physical education and training for the young, the adolescent, and the adult has been far and away the most conspicuous and significant trend in general education of recent years. Though it is indeed a world movement, having, for weal or woe, political significance and momentum, and though it is but a particular phase of a universal youth movement, it has in each country its own characteristics. A nation, in short, must not only educate its children; it must educate itself. In Germany, Russia, and Italy, the movement has been centralized, subsidized, and controlled by State or semi-State agencies, so that in those countries the Scout movement has been either eclipsed or transformed or absorbed, and a decided check has been given to religious associations of youth for purposes of physical and moral education particularly in Germany and Italy. Even in the Far East, in China and Japan this emphasis on organized physical education is a central feature of national educational policy, and it is illustrated no less in Africa and particularly in the recent report on native education in East Africa.

Peculiar to German education, but spreading throughout the Continental countries and with its advocates in America and Britain is the associated system of youth labour camps. That education must be less academic and more practical, less superficially cultural, and more serviceably efficient and utilitarian, more civic and less private and personal, is the keynote everywhere, although in the democratic countries, there is ceaseless vigilance to maintain the cause of individuality and freedom in education. In every direction this enlarged corporate view of education is manifest in the extraordinary growth of school camps, journeys and cruises.

Such a rejuvenation and rehabilitation of education calls for

the overhaul of its methods of educational assessment, and at the present time every aspect of the examination system is under critical scrutiny and reorganization. Indeed, universities both in the old world and the new, are at present so preoccupied with problems of physical education and the training of teachers that some apprehension is felt lest their traditional function of the dissemination of higher education, the advancement of learning, and of research be hindered or diverted.

But a more significant feature of world education is the encroachment of the State upon the traditional and original autonomy of the universities. Nowhere is that more acutely expressed and felt than in and under the Central European dictatorships. Personnel has been transformed, studies have been wrested from their proper position as independent forms of truth and inquiry, and indoctrination has permeated the higher learning. Even in the midst of the civil war the head of the Spanish Nationalist State (General Franco) found himself able to create by edict an Institute of Hispanic Studies.

But the characteristic individualism of education among the English-speaking nations has not been seriously challenged by the growth of State assistance and control, and there is every evidence of vigilance on the part of the teaching profession and of local education authorities to maintain the tradition of freedom in education; freedom in technique, in organization, in timetables, in curricula, in methods of discipline. This concern for freedom finds further expression in the increasing activities of parents' associations in the United States and in the extending influences in Britain of such bodies as the P.N.E.U. and the Dalton Association and the Montessori Society. A further indication of the contrast between democratic liberty and freedom in education and continental dictatorship in school and university is to be found in the growth of the library movement. Increasing provision is made for school libraries, for trained librarians, for co-operation between public and school libraries, for exchange facilities between university libraries of different countries. In this development there is further found that international note which is expressed in the growing number of foreign students in residence in universities, colleges, and schools. On the other hand, technical education, while sharing in the general process, still lacks full public recognition and support save in its ancient homes, Germany and Switzerland. At the present time the demand for such education comes rather from the employee than from the employer, and there is a world-wide need for fuller and more sympathetic participation by industry in the sphere of technical education. Nevertheless, vocational guidance is an increasing preoccupation of teachers and administrators, so that on the one hand national governments issue pamphlets on the choice of careers, and on the other hand schools and colleges appoint careers masters or organize appointments bureaus. Their work in America is facilitated by that of vocational guidance clinics and in Britain by the Institute of Industrial Psychology. The authorities in Russia, Sweden, Belgium, France, and Britain make their contribution to this problem in the appointment of professional psychologists, psychiatrists, and social workers: education is thus conceived to be a social service, constructive, cultural, civic, and remedial.

Peculiar to contemporary education is the problem of the falling birth-rate, the effects of which are being felt, in every country at every educational level, and in every type of school or college. It has its counterpart in the growing importance of practical subjects in education and of the plea for education for civic and economic efficiency. Dialectic materialism influences education no less than political and social organization. Can the school save democracy, can democracy save its schools? These are questions asked on both sides of the Atlantic, and the issue at stake

## EDUCATION, SECONDARY—EGGS

in philosophy and education throughout the world is the same, that between a materialistic and a spiritual view of human society and individuality.

For more complete details on education see also ADULT EDUCATION; BACKWARD CHILDREN; ELEMENTARY EDUCATION; GIFTED CHILDREN; SECONDARY EDUCATION; UNIVERSITIES AND COLLEGES; VOCATIONAL EDUCATION, etc. (A. A. C.)

**Education, Secondary:** see SECONDARY EDUCATION.

**Educational Policies Commission:** see EDUCATION.

**Education Association, National:** see NATIONAL EDUCATION ASSOCIATION.

**Edward VIII:** see WINDSOR, EDWARD, H.R.H. THE DUKE OF.

**Edwards, Alfred George** (1848–1937), British divine and first archbishop of Wales born at Llanymawddwy, Nov. 2, 1848. A biographical notice of him appears in the *Encyclopædia Britannica*, Vol. 8, p. 19. His energetic pilotage of the Welsh Church in the early years of its disestablishment achieved such excellent results that the archbishop confessed that the disestablishment had actually proved to be a benefit. He resigned in 1934. In 1927 Dr. Edwards published his *Memories*. He died at St. Asaph, July 22, 1937.

**Eggs.** Production and trade in eggs suffered severe losses during 1937 in both the United States and the United Kingdom, although from widely different causes. In egg-laying trials during 1937 in Great Britain the mortality rate of hens rose to 17.7%, as compared to a death rate of 6.6% in 1926–27. In the U.S. conditions diametrically opposite led to a high egg-laying rate and heavy production that reduced prices from a high of 26¢ a dozen in March to 17¢ in December and caused a loss to dealers in storage eggs estimated at nearly \$10,000,000 by the Chicago Mercantile Exchange, the largest U.S. market for egg contracts.

The Imperial Economic Committee estimated egg production in 1937 in the United Kingdom at around 36,000,000 great hundreds, a further extension of the decline in production that led the Poultry Technical Committee of Great Britain to report in 1936 that the British poultry industry was struggling under an almost impossible handicap of diseased and weak stock. This condition the committee attributed to the fact that during post-war years when prices were very high, the demand for hatching eggs and day-old chicks was so great little or no attention was paid to the quality of the new flocks thus produced. As a result of failure to select eggs from strong breeding stock flocks of little stamina were produced. Tentative proposals for remedying this situation suggest that producers of hatchery eggs and day-old chicks be registered and inspected and imported hatching eggs also regulated. The expense of restoring British flocks to a healthy, profitable state is estimated at about £110,000 annually.

Imports of shell eggs into the United Kingdom in 1937 were 24,732,000 great hundreds, valued at £10,440,000, which was approximately the same number and value of 1936 imports. Eggs not in shell, including both frozen and dried eggs, imported in 1937 were 884,000 cwt., valued at £2,267,000, approximately the same as 1936.

Contrary to predictions the Sino-Japanese conflict has not decreased the importations of Chinese eggs into the U.S. Instead importations from China and other sources increased in 1937, nearly 90% of imported dried eggs coming from China. For the ten months ending Oct. 31, the 1937 U.S. eggs imports were as follows, figures in parentheses being for the same period in 1936:

Whole shell eggs, 494,745 dozen (311,883). Whole dried eggs, 565,919 lbs. (438,675). Whole frozen eggs, 25,412 lbs. Egg yolks

dried, 5,171,908lbs. (4,487,478). Yolks frozen, 1,454,542lbs. (624,780). Albumen dried, 2,690,673lbs. (2,250,736).

One of the larger U.S. meat packing companies announced a newly developed and patented process for producing odorless, unfermented dried egg whites, or albumen. Two plants were opened in egg-producing centres to manufacture the product, which, it is expected, will decrease imports.

Receipts of eggs at the four principal U.S. markets, New York, Chicago, Philadelphia and Boston, in 1937 were 13,537,369 cases of 30 doz. to the case, as compared to 13,319,369 in 1936. In the late winter and early spring of 1937, the period when eggs are packed for storage in the U.S., prices reached as high as 26 $\frac{3}{4}$ ¢ per dozen in March, many dealers buying eggs to store and the Federal Government buying eggs to give to persons on relief and also to stabilize the market. The peak of the volume of eggs in storage is usually about Aug. 1 and on that date there were 3,714,000 cases of shell eggs and 167,111,000lbs. of frozen eggs in storage. Meanwhile egg prices had declined steadily from the March high and continued to decline to the end of the year, the December rate of egg production being one of the highest on record. (See POULTRY.) (S. O. R.)

**Egypt**, an independent kingdom of north-east Africa; bounded N. by the Mediterranean, S. by the Anglo-Egyptian Sudan, N.E. by Palestine, E. by the Red sea, W. by Tripoli and the Sahara. Capital, Cairo; ruler, King Farouk (*q.v.*); flag, green, with a white crescent, having three five-pointed white stars in an equilateral triangle between the horns, which point towards the flagstaff.

**Area and Population.**—Area, c.380,000 sq.mi. (13,500 cultivated); pop. (1937), 15,904,525. Over 90% are Moslems, with some 8% Christians and 0.5% Jews; and the language of the overwhelming majority is Arabic. Education is compulsory between the ages of 7 and 12 at 2,748 "maktabas," attended (1934-5) by 558,628 pupils. There were also, during the same period, 103 other "maktabas," 38 high elementary schools, 158 primary schools, 33 secondary schools, and a State university. Cairo had (1937) a population of 1,307,422; other leading cities (1927 census) are: Alexandria, 573,063; Port Said, 104,603; Tanta, 2,016. (X.)

**History.**—On Jan. 12, Sir Miles Lampson presented his credentials as first ambassador to Egypt, and the British officers holding executive rank in the Egyptian army left the service. On Feb. 2, implementing the provision in this respect in the Anglo-Egyptian Treaty of Alliance, Egypt issued an invitation to the Capitulatory Powers to a conference on the question of the abolition of the Capitulations and the reorganization of the mixed tribunals. This conference opened at Montreux on April 12, and on May 8 a convention was signed abolishing the Capitulatory régime and reorganizing the mixed tribunals (*see* CAPITULATIONS). Pursuant to the special provision in the Anglo-Egyptian Treaty, Egypt, on the recommendation of Great Britain, was admitted to the League of Nations on May 27 at a sitting of the assembly over which His Excellency Rusto Arras, Turkish minister of foreign affairs, presided.

On July 25, His Majesty King Farouk returned from Europe, where he had spent the summer. On the 29th he came of age, the agency council was dissolved, and the King took the oath of fidelity at an extraordinary session of the Egyptian parliament. Two days later, in accordance with custom, the cabinet resigned and the King entrusted the formation of a new one to the outgoing premier, Mustapha Nahas Pasha, who took the opportunity of effecting a reconstruction.

On Nov. 18 King Farouk inaugurated his first parliament. Ten days later an unsuccessful attempt was made on the life of the

FAROUK I enthroned at Cairo July 29 as king of Egypt and Misr, lord of Nubia and the Sudan, and sovereign of Kordofan and Darfur

premier, Mustapha Nahas Pasha, by a young Egyptian, called Abdel Kader Izzeddin. The inquiry showed that he belonged to the "Green-Shirts," an organization of young men hostile to the Wafd, and that he had been in close touch on the spot with Arab leaders in Palestine, Syria, and Iraq. On Dec. 7 His Majesty inaugurated the 15th Ophthalmic Congress, which was attended by delegates from all the world. On Dec. 30, the King dismissed the Nahas cabinet and entrusted the formation of a new ministry to Mohamed Mahmud Pasha, who constituted a cabinet drawn from all parties in the country except the Wafd.

The change in cabinet was due to a disagreement between the King and Nahas Pasha on the question of the interpretation of the Royal prerogatives and the activities of the "Blue-Shirts," a body of young Egyptians organized by the Wafd, whose supreme chief was Nahas Pasha. The trouble really dated back to the coming of age of the King, when the cabinet tried to alter the army oath from allegiance to the King alone to allegiance to the constitution as well. The personal situation of the King was alleviated by the nomination of Aly Maher Pasha as head of the royal cabinet and thus political adviser to His Majesty. To this appointment the cabinet had raised objections, but gave way when the King intimated that he intended to exercise his powers in regard to nominations to his personal staff. The crisis became acute early in December owing to the King's refusal to sign the decree for the nomination of a Wafdist to a vacancy in the Senate.

On Dec. 24 the Wafd Parliamentary Committee, comprising the Wafd majority in both chambers, recorded at a public meeting its confidence in Nahas, and each of its members took an oath of implicit obedience to him. As a last effort to reach a satisfactory solution the King, on Dec. 29, made two alternative suggestions to Nahas Pasha, *viz.* the formation of a coalition cabinet of

all parties, or a commission composed of past and present prime ministers and other high political and legal officers, the verdict of either of which on the questions at issue between palace and cabinet he was prepared to accept. Nahas Pasha rejected the proposal for a coalition cabinet, but accepted arbitration in principle if the commission were composed of jurists and not politicians. Then it was that the King decided to dismiss the cabinet, on the ground that he had in his possession ample proofs that the country did not approve of the methods of this cabinet, which were not in accordance with the spirit of the constitution and restricted public liberty.

**Trade and Communications.**—Egypt had another prosperous year in 1937. The State accounts, closed on April 30, the end of the financial year, showed a surplus of £E.1,311,000. This brought the general reserve up to £E.34,000,000. For the seven months ending Nov. 30, a further increase in revenue of £E.2 millions was recorded, mainly in customs, which produced £E.600,000 more revenue than the corresponding period of the preceding year.

A record cotton crop came on the market in Sept. 1937, viz. 11,140,000 kantars, an increase of 2,000,000 kantars over the previous record. The increase in production more than compensated for the decrease in prices. The area under cultivation was 1,978,000 feddans, representing an increase of 15% over the previous year, and the average yield improved to 5.52 kantars per feddan.

Trade during the year was brisk. For the 11 months ending Nov. 30, imports amounted to £E.34,500,000 and exports to £E.36,160,000, an increase of £E.5,910,000 and £E.8,000,000 over the corresponding period of 1936. Main increases under imports were kerosene £E.420,000, cotton piece-goods £E.700,000, coal £E.720,000; and, under exports, cotton £E.5,900,000, and gold £E.1,000,000. The year again ended with a trade balance in favour of Egypt.

Early in December Sir Thomas Barlow and Mr. James Ainsley visited Egypt as a good-will mission on behalf of the Manchester Chamber of Commerce to investigate the situation from the point of view of Egyptian purchases of British manufactures, particularly textiles. In view of Egypt's favourable trade balance, their investigations were directed to seeing how best this could be used to develop a two-way trade between the two countries.

During the year parliament ratified an agreement with the Suez Canal Company, giving the Egyptian Government an interest in the undertaking and Egyptians a greater part in the administration. (See SUEZ CANAL.)

The development of internal communications has been stimulated by the Anglo-Egyptian treaty. In 1936, there were 2,973 kilometres of standard-gauge, and 1,413 kilometres of narrow-gauge railways; and on May 1, 1937, a fast Diesel railcar service between Cairo and Port Said was instituted. There were, in 1936, 44 mercantile steamships (registered net tonnage 40,505), carrying the Egyptian flag, and 173 sailing vessels (international tonnage 11,662). In March, the all-air service between England and Egypt was inaugurated, and on June 1 the new service was begun from Southampton to Durban via Alexandria and Cairo.

**Finance and Banking.**—The monetary unit is the gold Egyptian pound of 100 piastres (one £E. = c. £1 os. 6½d.). The budget for 1937–38 has been balanced at £E.36,116,500. Revenue is obtained by direct taxation of agricultural land and of houses in the principal towns, and by indirect taxation on all imported and a few exported commodities. The National Bank of Egypt (*Bank Misr*) is an Egyptian corporation owned by its shareholders; but all the other 15 commercial banks are either branches of foreign banks or companies founded mainly with foreign capital.

**Defence.**—In order that she may take her full share of the burden of defence, in accordance with the Treaty of 1936, Egypt

THE ASWAN OR ASSUAN DAM in the Nile Valley of Southern Egypt forms a vast irrigation reservoir on which much of the agricultural production of Egypt depends

is enlarging her army. The British military adviser to the Government, Major-General Marshall-Cornwall, submitted a report in February, acting upon which the Government proposes to increase the army to about 22,000 men during the coming three or four years.

(A. MN.)

**Eire:** see IRISH FREE STATE.

**Elections.** Though it was an off year for national elections, 1937 witnessed several contests in the States, which were eagerly watched by political observers in the hope of gauging public sentiment. No clear drift of opinion, however, was discernible. In the minor general elections held in Michigan (April 5) and Kentucky (Nov. 2) the Democrats made some small gains; and in Virginia, as usual, they elected (Nov. 2) their candidate for governor—James H. Price. In the various referendums of the year, Maine, on Aug. 16, voted down the proposal of a sales tax for old-age assistance; New Hampshire, on March 7, refused assent to the calling of a State constitutional convention; Alabama, on March 10, exchanged its dry law for a dual system of local option and State control of liquor stores; Tennessee (Sept. 23) and Georgia (June 8) chose to remain wholly dry.

More significantly, in their June election, the people of Georgia approved 25 constitutional amendments which were designed to enable the legislature to carry out the social and economic programs of their New Deal governor, Mr. E. D. Rivers. Arkansas on the other hand, in its special election to fill the senatorial vacancy caused by the death of Joseph T. Robinson, elected Representative John E. Miller, an independent Democrat, in preference to the party's regularly nominated and loudly professing New Deal candidate, Governor Carl E. Bailey. In New Jersey a bitterly fought campaign for the governorship resulted on Nov. 2 in the election, by a somewhat doubtful majority, of Senator

A. Harry Moore, conservative machine Democrat, over Lester H. Clee, Republican.

But by far the most interesting and significant election of the year was that held in New York State and more particularly in New York city on Nov. 2. A lively primary campaign, in which Senator Royal S. Copeland with Tammany support sought nomination for mayor on both Democratic and Republican tickets, had culminated on Sept. 16 in his complete elimination and the selection of Jeremiah T. Mahoney by the Democrats and Mayor Fiorello H. La Guardia by the Republicans and Fusionists. Both Mahoney and La Guardia avowed their strong attachment to the New Deal as a national policy. But La Guardia insisted that the election was a local matter, emphasized his record for clean and efficient city government; and it was on that issue that he was elected with a plurality of more than 450,000 votes. Thomas A. Dewey, also running on the Fusion ticket, was chosen for the important office of district attorney for New York county. In the State at large the Republicans were generally successful: strengthening their control over the State Assembly; naming a majority of the delegates to the State constitutional convention (to meet in April 1938); and filling the three vacant Congressional seats.

To one of these vacancies, formerly occupied by a Democrat, they elected Mr. Bruce Barton, writer and advertising man. (See also DEMOCRATIC PARTY; REPUBLICAN PARTY.)

**Schedule of Elections.**—Presidential elections in the United States are uniformly held on the Tuesday after the first Monday in November in years designated by multiples of four. Congressional elections are held on the same or corresponding day in even years by all States except Maine, which adheres to its old custom of holding elections on the second Monday in September. Governors are elected in even years on the same day as members of Congress in 27 States: Arizona, Arkansas, Colorado, Connecticut,

Georgia, Idaho, Iowa, Kansas, Massachusetts, Michigan, Minnesota, Nebraska, New Hampshire, New Mexico, New York, North Dakota, Ohio, Oklahoma, Oregon, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Vermont, Wisconsin, and Wyoming. They are elected quadrennially at the same time as the president in 11 States: Delaware, Florida, Illinois, Indiana, Missouri, Montana, Nevada, North Carolina, Utah, Washington, and West Virginia; quadrennially at the congressional elections between presidential years in 4 States: Alabama, California, Maryland, and Pennsylvania; quadrennially on the corresponding day in the years immediately preceding presidential elections in 2 States: Kentucky and Mississippi; quadrennially on the corresponding day in the years immediately following presidential elections in 1 State: Virginia; triennially on the corresponding day (latest election Nov. 2, 1937) in 1 State: New Jersey. Louisiana chooses its governor quadrennially in presidential years on the third Thursday in April; and Maine, biennially at the same time as she selects her Congressmen. (G. P. BA.)

**Great Britain.**—The by-elections to the British House of Commons were very much more numerous during 1937 than in most years; this was largely due to the peerages conferred on the occasions of the accession and coronation of King George VI, and to the resignation of Mr. (Earl) Baldwin and the reconstruction of the cabinet arising therefrom; though no less than 11 out of the 26 were due to the decease of the sitting member.

At the end of the year four constituencies were vacant: Scottish universities (1 seat), Farnworth, and Pontypridd, owing to the deaths of the Rt. Hon. Ramsay MacDonald (*q.v.*) (N.Lab.), Mr. Guy Rowson (Lab.), and Mr. David Lewis Davies (Lab.); and Ipswich, owing to the elevation of Sir John Ganzoni, Bt., to the peerage.

**Electoral Vote.** The representation of the various States in the electoral college nominally selecting the president and vice-president of the United States every four years is determined by adding the two senators to the number of representatives of each State (*U.S. Constitution*, art. 2, sec. 1). Since the first presidential election in 1789 when 69 electors cast votes for George Washington, the number of electors has gradually increased, the only considerable decrease occurring at the time of the Civil War. The total has remained at 531 since the reapportionment following the census of 1910. Despite the constitutional provision that a new enumeration should be made every ten years (art. 1, sec. 2), no adjustment was made in accordance with the population statistics of 1920. Although changes were adopted following the census of 1930, the total figure remained the same as twenty years before. As adjusted according to the 1930 census and as in force during the presidential elections of 1932 and 1936, the 531 votes which will provide the basis for tabulating the results of the election of 1940 are distributed among the 48 States as follows:

Ala. . . . . 11	Ill. . . . . 29	Minn. . . . . 11	N.C. . . . . 13	Tenn. . . . . 11
Ariz. . . . . 3	Ind. . . . . 14	Miss. . . . . 9	N.D. . . . . 4	Texas . . . . . 23

Ida. . . . . 4	Mich. . . . . 19	N.Y. . . . . 47		

**Electrical Engineering.** The amount of electric energy generated for public sale in 1937 was greater than ever before, the United States total being a little less than 120,000,000,000 k.w.h., greater than the sum of the outputs of the three largest European countries (Germany, U.S.S.R., Great Britain).

ENTY OF AMMUNITION but he hadn't provided himself with a gun to use it. Post-election view of the Republican presidential campaign, as seen by Seibel. *The Richmond Times-Dispatch*

Increase in load, combined (in the U.S.) with a policy of non-expansion during the depression, forced utilities to enlarge generating capacities rapidly. Many superposed turbogenerators were introduced. One new unit (22,000kw.) was designed to operate at 925°F. and 2,400lbs. per sq.in. pressure, the highest pressure to be used with a turbine of this size. Many new units operate at 3,600r.p.m.; some are hydrogen cooled. Steam accumulators for carrying peaks have not been introduced in the U.S., although many installations are to be found in continental Europe.

Many new large hydro projects were begun or projected, particularly in Italy and U.S.S.R. In the U.S. the Boulder dam project, in which are installed the largest water turbines in the world, began operation.

In the field of transmission and distribution high voltage D.C. transmission underwent intensive study; use of capacitors on lines increased greatly; a 220kv. cable was put in service; and Petersen coils were used in the U.S. after long popularity in Europe.

The expansion of utilities' capacities and the very general industrial and domestic demand for electrical equipment kept the electrical manufacturing industry in most countries working near capacity. Outstanding developments in design, size, or other characteristics were, however, few. In Europe 36kv. generators were being built; but none had been produced in the U.S. In the U.S.S.R. a 100,000kw., 3,000r.p.m. generator under construction was the largest to be constructed in Europe, although larger ones have been built in the U.S. Although industrial production in the U.S. did not reach the 1929 peak, electrical energy used in industry was approximately 15% greater, indicating the steady electrification of American industry, now almost complete.

It is an interesting commentary that the electric appliances available to domestic consumers were far more extensively used in the U.S. than in other countries, except possibly Canada. Electric refrigerators, for example, of which there are more than 5,000,000 in use in the U.S., were almost rarities abroad.

Rural electrification was vigorously pushed, but the situation in the U.S. remained bad, with only one farm in six electrified. The primary problem was to reduce costs so that extensions into sparsely settled territory could be made without loss. The impetus given by the Rural Electrification Administration in the U.S. led private utilities to do far more than they previously did in this line. England appeared to be definitely ahead of the U.S. in rural electrification, but the disparity in distances to be covered in the two countries made comparison of small value.

In transportation an important event was the beginning of further electrification of the Pennsylvania railroad's lines. Other important electrifications were under way in Italy, France, Germany, U.S.S.R., South Africa and England.

Trolley buses increased in popularity. They were extensively used in some European countries (more than 1,200 in London alone) and the demand for them in the U.S. steadily increased. In England a new electric automobile was introduced. The use of electric drive for ships decreased, or at most remained static, although the Atlantic speed record was held by the electrically driven "Normandie."

In communication, developments included the widespread use of carrier telephony, television broadcasting, the use, both experimental and commercial, of coaxial cables, and the contemplated commercial use of facsimile reproduction. There was no important development in radio broadcast transmission or reception. More than 15,300,000 telephones were in service in the U.S. at the end of the year.

Television broadcasting, which had been carried on in Germany, was begun in England, France and U.S.S.R. The English appeared to be in the lead. They standardized on 405 lines inter-

laced, 50 frames per second. Of considerable importance was the fact that television reception was obtained in one case at 80 miles from the transmitting station, a greater distance than was originally considered possible. In the U.S. television remains in a practically fully developed experimental stage, awaiting an economic rather than a technical development.

Coaxial cables were installed in several countries. In the U.S. the experimental New York-to-Philadelphia line was used successfully in commercial service (240 telephone and telegraph channels) and for the transmission of television programs, but was removed from service in an attempt to increase the frequency band transmitted from one to two million cycles.

In the United States where the population is spread over a large area, the development of a wide band conductor to transmit television programs from one station to another is the only means now apparent for covering a large area (television broadcasting is usually considered limited to optical distances).

The 100th anniversary of Wheatstone's first use of the telegraph passed almost unnoticed, being a commentary on the decreasing relative importance of the telegraph in communication.

In the field of illumination, developments include appreciable increase in the efficiency of lamps, new gaseous lamps for high-way illumination, and the beginning of the development of "cold light," in which there are great potentialities not likely, however, to be available commercially for some years. In England discussions of illumination, even of highway illumination, still included consideration of gas illuminants. (See also PUBLIC UTILITIES; RADIO, SCIENTIFIC DEVELOPMENTS OF; and the articles on Electrical subjects in the following pages.) (J. G. Bd.)

**Electrical Industries.** The total output of electric utilities in the U.S. during 1937 was approximately 119,000,000,000kw.h., which exceeded that of the previous year by 8.5%. This output was comprised of 74,000,000,000kw.h. from fuels, 40,000,000,000kw.h. from water power and 5,000,000,000kw.h. purchased from other sources, including that imported from Canada. During the year the monthly output was substantially in excess of that in the previous year, until the recession in general business caused a small decrease during the two final months. The foregoing statistics are exclusive of power generated and consumed in private industrial plants, the aggregate of which was a very large figure, about 25% of the utility output. Among the countries of the world the U.S. produced about one-third of the total output; statistics for 1937 are not available, but in 1935 the countries ranking next were Germany with about 11%, Russia with 7%, Canada 7%, United Kingdom 7%, and Japan 6%.

Generating capacity of the utilities in the United States at the close of 1937 was approximately 35,042,000kw., of which about 71% was in steam plants, 27% in hydro plants and the remainder in plants using internal combustion engines. New generating equipment installed during the year comprised 1,050,000kw., and equipment retired amounted to 268,000kw., leaving a net increase of 782,000kw. Construction expenditures by private utilities for steam generating stations amounted to approximately \$113,060,000 and for hydro-electric plants \$10,540,000 or a total of about \$123,600,000. There was a trend toward higher operating economy through the adoption of higher steam pressures and temperatures. Many of the new generating units represented high-pressure equipment designed to exhaust their steam to older units operating at moderate pressures; these so-called "topping" units effected a marked increase in over-all economy while also prolonging the useful life of older equipment. Industrial generating plants were substantially improved and enlarged during the year, but statistical data are not yet available. Th

aggregate generating capacity in such plants is about one-half that in utility plants. The Federal Government continued construction work on its various hydro-electric power projects, including the Tennessee valley program under TVA, the Grand Coulee project, Bonneville, and others.

Total construction expenditures in the private utility field during 1937 were estimated at \$455,500,000 or an increase of about 57% over 1936. This total included \$203,000,000 for distribution poles, wires and equipment. About 794,000 new customers were added, making a total of approximately 27,000,000. These figures include about 157,000 farms which were connected during the year, bringing the total to about 1,200,000. The Rural Electrification Administration of the Federal Government expanded its activities in promoting the construction of rural distribution lines and over 50,000 farm families are already benefiting from this program. Today about one farm in every six in the U.S. enjoys some of the benefits of electric service.

Total revenue from sales of energy by private utilities was approximately \$2,200,000,000 or about 0.75% over the total in 1936. The average revenue for all classes of service was 2.22 cents per kw.h., compared with 2.27 cents in 1936. Average annual use per residential customer in 1937 was 797kw.h., compared with 727 in the previous year. Average revenue from residential service was 4.37 cents per kw.h., as against 4.65 cents in 1936. The average cost in 1937 was about one-half that in 1913.

Electrical manufacturing made substantial gains in volume during 1936 and continued this progress through the first half of 1937. The industry is outstanding for its dependence on research and development to produce new uses and applications for electrical energy, new equipment and appliances, improved practices in construction and operation, and lower cost to consumers. The year was notable for its technical progress in manufacturing, construction and operation. Much progress was made with improved methods of electrical distribution, including low-cost lines for serving rural areas. On the economic side, the utilities under private ownership protested against public competition from new hydro-electric projects financed by Federal funds, but as the year closed no agreement on a mutually satisfactory national policy had been reached. Rapid recession in general business conditions during the second half of 1937 retarded the growth of utility output and caused a decline in manufacturing activity. The industry lost the last of its great pioneers through the death on March 13 of Elihu Thomson.

**BIBLIOGRAPHY:** Current files of *Electrical World*, *Electric Light and Power*, *Electrical Engineering*, *General Electric Review*, *The Electric Journal*, and other technical periodicals.

**Great Britain.**—The national grid system of Great Britain was extended during the year 1937 by the construction of several additional lines of 132kv. and also 33kv. At the close of the year the grid embraced a total of approximately 39,000 miles of line. The total number of electricity units generated by authorized undertakers during the year was 22,905,000,000, which was an increase of 13% over the previous year and double that of 1931. The number of selected generating stations in the grid remained at 37. The vulnerability of the overhead grid system from the standpoint of national defence is focussing attention on the future possibilities of underground cable transmission at high voltage.

Power station additions authorized in 1936 were in progress during 1937 but relatively few reached completion. The Central Electricity Board authorized power station additions in 1937 aggregating 635,000kw., consisting of 18 turbo-generator units ranging in size from 3,500kw. to 100,000kw. Operating steam pressures as high as 1,900lb. per sq. in., temperatures as high as 950° F., and generator voltages as high as 33kv., were features of some of the new installations. Many extraction-type turbo-

generators were ordered for industrial plants.

Farm mechanization made important progress, owing in large part to a prevailing shortage of labour, as well as much greater convenience and efficiency in farm operations. At the close of the year over 30,000 farms were supplied with electricity, compared with about 600 only nine years ago.

Electrical manufacturing in the United Kingdom, for home and export, as measured by the index of orders for heavy generating plants, stood at 171 for 1937, based on the monthly average of 1920 as 100. The index of United Kingdom electrical exports of combined apparatus and machinery was 190, and for imports was 152, based on the respective monthly averages for 1932 as 100. The combination of complete industrial recovery and the Government's rearmament program resulted in sustained activity throughout the year. There were 319,600 workers employed in the electrical manufacturing industry in July 1937, compared with 273,000 a year previous. At the close of 1937 only about 5% of the workers were unemployed. The value of British electrical exports in 1937 was practically double that of the worst year of depression (1933) and only a little more than £1,000,000 below the high record of 1929. In volume or quantity the exports were probably larger than those of any previous year.

In the Dominion of Canada the total generating capacity reached 8,112,750h.p., which included an increase of 167,160h.p. during 1937. Over 95% of this capacity is water power. No fewer than 60% of the families, both urban and rural, performed all household labours with electricity.

**BIBLIOGRAPHY:** Annual review issues of *The Beama Journal* and *The Electrician*, and *The Journal of the Institution of Electrical Engineers* for January 1938. (F. F. F.)

**Electric Lighting.** Under the terminology of electric discharge lamps, progress centred in 1937 on sources employing mercury and sodium vapour. Evolving to regular volume production there were sold in the United States approximately 65,000 mercury and 7,500 sodium lamps. In Great Britain some 70,000 mercury lamps went into service, approximately half for industrial, half for street lighting purposes. Trial installations of sodium lamps grew in number chiefly in western Europe and the United States, largely confined to suburban highways and bridges. The majority of mercury vapour lamps (high pressure types) in North America were installed in factories, largely because at 40 lumens per watt they approximately double the filament lamp output. On account of a deficiency in red they were not found suitable for stores or offices, but proved especially decorative when applied to the lighting of shrubbery and trees and to the floodlighting of building façades.

Commercial sizes of mercury lamps in North America were 400, 250, 100 and 85 watts to which in Great Britain were added 125 and 150 watt sizes. Sodium lamps in the United States were produced in 6,000 and 10,000 lumen sizes, the latter predominating. Experimental super-pressure mercury lamps appeared, notably the water-cooled quartz capillary types of 300 and 1,000 atmospheres. These sources produced a brightness exceeding that of the sun with promise of high concentrations for optical projection.

Employing low pressure mercury vapour in a tubular lamp and by coating the inside of the tube with compounds that fluoresce under the short wave excitation, there were introduced new lamps noteworthy for high efficiency colours. In America some three sizes, namely, 15, 20 and 30 watts were standardized respectively 18, 24, and 36 inches long and emitting white, blue, green and pink light at some 40 lumens per watt.

There was made commercially available a lamp emitting radiation chiefly between 2,000 and 3,000 amp., finding usefulness in killing air-borne bacteria, and for sterilizing food containers; also

killing the spores of fungi hence reducing moulds on meats and baked goods. In bulb form these special lamps began to find service in the medical treatments of superficial wounds and skin diseases.

An increase of some 10% in light output efficiency followed double-coiling the tungsten wire filament in smaller wattages of American-made lamps. European research concentrated upon more viscous gas within the bulb to reduce convection heat losses, chiefly employing the rare atmospheric constituent, Krypton.

**Lighting Materials and Applications.**—A widespread usage of glass blocks and moulded plastic forms appeared in 1937 giving expression to architectural lighting. Transparent plastics incorporating fluorescent dyes gave further incentive to the use of ultra-violet or black light for interior decoration.

Notable surveys of schools indicated need of lighting intensities for classrooms upward of 20 foot-candles and suggested more cheerful colours of paints. In factories, largely as a result of industrial lighting surveys in the United States and Great Britain, fixtures developed consisting of large hoods or indirect reflecting surfaces with silvered-bowl lamps, and more attention to the spectral or directional quality of light. A compulsory factory building code in England was a major incentive to better lighting conditions, while the British Government's study of the "grumble point" produced data showing that artificial light is needed where daylight on the work falls to approximately 5 foot-candles.

FITTING INSULATED COPPER COILS in a condenser for the control of power on an electric transmission line

## ELECTRIC POWER GENERATION

Polarizing screens reducing automobile headlight glare were introduced experimentally, together with sealed-in small size automobile head-lamps combining reflector and lamp bulb into one unit. Notable installations of outdoor lighting particularly accompanied by water effects were the Paris and Dusseldorf Expositions, the coronation of George VI, and floodlighting of French cathedrals. (See also GAS; INTERIOR DECORATION: *Artificial Illumination*.) (S. G. H.)

**Electric Power Generation.** Electrical energy continues to be obtained in the conventional manner from fuel and water power resources. Most of the available water power sites which are economically important from the standpoint of electric power production and disposition alone have been developed. The majority of the hydro-electric developments that are being undertaken at the present time are justified economically for the production of electrical energy only when considered in connection with irrigation, flood control and navigation, or a combination of these factors. Undertakings of such broad scope are necessarily of a public nature and consequently have been carried on as complete or partial public or governmental enterprises. Although the amount of electrical energy obtained from hydro-electric generating stations is relatively large, the greater portion is produced from steam driven prime-movers in fuel-fired generating stations. This type of undertaking has been restricted to the production and disposition of steam and electrical power, and as a result has been developed by private enterprise.

The principal improvement in 1937 in the hydraulic turbine has been the development of the adjustable blade propeller to improve the efficiency performance of the turbine under different water flow conditions. No major changes have been required or made in the design of generators driven by this type of prime-mover. Most of the steam driven turbines in operation at the present time have been designed to utilize steam at moderate temperatures and pressures. Large increases in the output and radical improvements in efficiency of steam turbines have been obtained by materially increasing the temperature and pressure of the inlet steam. Inlet steam pressures and temperatures of 1,200 lbs. per sq.in. and 950° Fahrenheit respectively are used quite generally for most of the steam turbines now going into service. A few projects are under construction using inlet pressures as high as 2,400 lbs. per sq.in. These increased pressure and temperature requirements have made it desirable and essential that highest possible rotational speeds be used in order to keep the weights and dimensions of the stator and rotor elements as small as possible. This requirement of the steam turbine has resulted in the recent rapid superseding of the 4-pole generating unit by the 2-pole unit.

The radical increase in steam temperatures and pressures has resulted in a vast increase in the output possible from steam turbines operating at speeds needed by the 2-pole generator. There are no similar unexploited features in the design of the 2-pole generator from which its output could be correspondingly increased to meet the turbine requirements. A material increase in the output of the 2-pole generator has been obtained from the summation of several incremental increases resulting from improved mechanical, electrical, thermal and magnetic properties of materials, more effective ventilation and improved design proportions and better utilization of materials. When using the best materials and design proportions available, it is still impossible to build the 2-pole, 60-cycle generators with air cooling in sufficiently large ratings to meet the electrical industry's present-day steam turbine requirements.

The additional output rating of the 2-pole, 60-cycle generator

STREAMLINED, articulated street railway unit, operated by the Key System of the San Francisco-Oakland Bay Bridge

was obtained by using hydrogen as the cooling medium. As compared to air, hydrogen has a density of 7%, heat transfer coefficient of 135%, thermal conductivity of 700%, and specific heat of approximately 100%. With these properties, the use of hydrogen as the cooling gas makes it possible to obtain an increase in rating of approximately 15% over that obtainable with air cooling, on the basis of maintaining given rating and performance characteristics. Since the windage-friction and ventilation losses are directly proportional to the density of the cooling gas, they are practically eliminated when hydrogen is used as the coolant. The increase in efficiency is on the order of 0.6 to 0.9%, depending on the rating. Since a mixture of hydrogen and air is explosive over a range of approximately 82 to 12% hydrogen, it is necessary to maintain a high percentage of hydrogen in the machine in order to avoid an explosive mixture and a fire hazard. A similar increase in rating and improvement in efficiency performance without any explosion hazard can be obtained by using helium as the cooling gas. At the present time, however, the use of helium gas for this application is excluded on account of its scarcity and excessive cost. (C. M. LA.)

## Electric Transmission and Distribution.

The year 1937 brought no fundamental changes in the transmission of electric power either over long or short distances. The technique of alternating-current transmission remains as before. Neither did its potential competitor, the direct-current transmission system, gain ground in practical application.

There has been some increase—as is traditional—in overhead line mileage. The recently established maximum voltage level for such lines has not been exceeded; Boulder dam's 287,000 volts still stand unchallenged. In the field of underground transmission the most helpful contribution of the year may well be the additional operating experience gained with the world's only 20,000-volt single-conductor, oil-filled cable installation (put into operation in Paris, March 1936). The successful performance of this cable should strengthen confidence in underground transmission in this voltage class and in the reliability of such high-voltage cables.

The question of alternating current versus direct current is an old one. The renewed interest in the problem, quite apparent during recent years, is primarily a result of the very material development in static apparatus for conversion from one type of current to the other coupled with the reasonable expectation that still further developments are not too remote. If the latter prognostication be true, is it possible to design a direct-current system superior to the conventional alternating-current system? The former would be devoid of certain undesirable features inherent

in the alternating-current system, notably those affecting synchronism and stability which greatly increase and ultimately become unmanageable as transmission distances and blocks of power to be transmitted increase. It must not be assumed *a priori*, however, that the direct-current system, designed along the general lines now conceived and which, indeed, appear to embody real possibilities, might not be afflicted with offsetting difficulties in view of the fact that the new elements which will enter into it have not as yet reached ultimate development (conversion and switching equipment). Neither is the long-time effect of high direct-current voltages on line and cable insulation fully understood at present. Theoretical studies continued during 1937 although possibly at a slightly decelerated pace. This decrease was no doubt caused by a fuller realization of the many major technical problems which still remain to be solved. Thus practical high-voltage, direct-current transmission has been delegated to the state of a comparatively long-range proposition even though in due time it may prove itself to be the system.

To date, the direct-current system for transmission purposes and using static conversion equipment is reduced to practice in a single case on a moderate-scale, constant-current basis (substantially an experimental installation, in U.S.). In addition there is the old constant-current system (in France) operating on the Thury principle. Many engineers, however, believe it is questionable whether constant current rather than constant potential is the correct and ultimate answer.

Progress was made in development and application of equipment associated with alternating-current transmission. Thus there was further application of high-speed circuit breakers, which were recognized as the most effective single agent in combating the destabilizing effects of faults on important transmission lines. They help to keep the systems intact and operating by rapidly eliminating the faulty circuit. Further experience was also secured with ultra-high-speed, high-voltage reclosing circuit breakers, this type of breaker being particularly meritorious for important single-circuit tie lines.

Noteworthy also was the further application of and experience with carrier-current relaying of important lines. The outstanding features of this type were selectivity and speed. It now seems to have become thoroughly established that this type of relaying hereafter will be much more frequently applied. Carrier currents have also been used recently for remote supervisory control.

**Distribution.**—The most significant general trend in electric distribution may well be the extension of service to rural districts. The economics of rural electrification was so unattractive that this class of development was relegated to the background while the more favourably located load areas were cultivated. The recent

STREAMLINED ELECTRIC LOCOMOTIVES on the Pennsylvania Railroad, which extended electrification from Philadelphia to Harrisburg, Pennsylvania

impetus imparted to rural electrification in most countries has several explanations: First, the private utilities having developed their urban systems and loads had approached the part of their power-supply programs which began to include rural areas. Secondly, a marked increase in usage by the average rural customer had come about as a result of cheaper domestic appliances and farm devices. Thirdly, there was a general recognition of the social desirability of getting electricity to the farm for both lighting and power purposes. Fourth, a promotional influence was created in many countries by State (Federal) or municipal organs (for example, the Rural Electrification Administration in the U.S.). (See also RURAL ELECTRIFICATION.)

As to plant, distribution efforts were directed toward the development of suitable, simple, and economic rural systems. Practical and relatively inexpensive but fully reliable designs in various forms for poles, lines, indoor wiring, etc., resulted. Furthermore, the establishment of appropriate rate structures was given much attention. With regard to the private companies there is no doubt that extending service to rural districts quite frequently involves a real element of risk. Where private companies are involved it is reasonable to believe, therefore, that further progress in rural electrification will be dependent upon the rapidity with which initial losses may be recovered and the service already undertaken put on a sound economic basis.

During 1937, attention was given to the question of underground distribution in residential districts. Underground systems for this purpose are naturally costlier than overhead systems. So far, residential underground distribution is only sparsely adopted. The power companies, however, are cognizant of the situation and studies were made to develop practical and inexpensive designs. The possibilities for reducing cost were limited by the requirement that reliability must be high. (O. G. C. D.)

**Electric Transportation,** of late years, has become diversified into four rather distinct categories. These are: (1) electric street and interurban railways, (2) electrically operated subways and elevated railway lines, (3) electrified trunk line railways, and (4) electric trackless trolleys, or trolley buses. While all of these types of electric transportation have certain points in common, their most recent developments have followed somewhat divergent lines.

**Electric Street and Interurban Railways.**—In the field of electric street and interurban railways, chief interest has centred in the progress being made with the new type of light-weight, fast, quiet car developed in the United States by the Electric Railway Presidents' Conference Committee. Rubber springing and improved control and braking equipment are the outstanding features of this design. To date (1937) a total of 645 of these cars have been built and put in service in seven cities. The first orders were placed as early as 1935, but it was not until 1937 that

a sufficient number of units had been in service for a long enough period to permit accurate appraisal of results.

Experience during the first year of their operation in Brooklyn, N.Y., showed that their improved performance attracted 36% more riders than had been accustomed to patronize the older type vehicles previously used. Similar results were reported from other cities. In every instance there was a substantial increase in schedule speed with the new cars. It is reasonable to expect, therefore, that cars of this type will play a dominant part in rolling-stock purchases during the next few years.

No cars of the "Presidents' Conference" design have yet been put in operation outside of the United States, although lively interest has been shown by street railway operating companies in all parts of the world. Patent arrangements have now been perfected in Italy and building of this type of vehicle may be expected in the near future.

New cars of more conventional design have recently been put in service in many of the larger cities throughout the world. Improved appearance has been sought in some instances by streamlining the bodies. Particularly notable in this respect are the latest cars built for Moscow and other Russian cities.

**Gasoline and Diesel Buses.**—With the great development that has taken place in gasoline-propelled and Diesel buses, as well as in electrically propelled trolley buses, there has been a trend toward the substitution of railless vehicles in place of street cars. This trend has been most in evidence in the smaller cities and in a few of the very largest cities such as London, New York and Paris where there are extensive underground railway systems to supplement the surface transportation facilities. In general, the effects of these substitutions have been smaller than is popularly supposed. For example, in American cities over 500,000 population, where the largest part of the transit business is concentrated, there has been an actual increase in the number of street car riders in recent years. Outside of these cities the volume of street railway riding has declined. Taking the country as a whole the electric street cars are now carrying about 68% of the surface business, trolley buses 2% and motor buses 30%.

**Rapid Transit.**—In the field of rapid transit—underground and elevated railway lines—the most interesting recent developments have taken place in London. There the London Passenger Transport Board has introduced new streamlined equipment having many points of superiority over the older equipment. There, also, the so-called "metadyne control" is being tried. This is an arrangement whereby a dynamotor is utilized to raise or lower the voltage on the propulsion motors as desired. Another interesting development in London is the program for extensive use of welded rail-joints on the rapid transit lines to eliminate the noise and jarring that result from the passage of wheels over rail ends not in close and accurate contact. Welded rail-joints have long been widely used by street railways, but their use on rapid transit lines is something of a novelty. In the United States the Brooklyn-Manhattan Transit Company is experimenting with continuous

United States Passengers Carried in 1937

	Electric Surface Railways	Rapid Transit Railways	Electrified Suburban Railroads	Trolley Buses	Motor Buses	Total
Cities over 500,000 . . . . .	4,625,000,000	2,359,000,000	138,160,000	68,500,000	1,140,000,000	8,330,660,000

sections of welded rail in lengths up to 1,000ft. as compared with lengths of only about 270ft. in London.

Extensions of the rapid transit systems have been undertaken recently in New York, Philadelphia, Paris, Moscow, Buenos Aires and elsewhere. These, however, have been of local rather than of general significance. Similarly there have been many extensions of trunk line railway electrifications, particularly on the continent of Europe, but they have involved comparatively few new technical developments.

**"Trackless Trolleys."**—Perhaps the most interesting recent development in the entire field of electric transportation has been that of the trolley bus or so-called "trackless trolley." Installations of this type were first made many years ago but they did not turn out particularly well due to limitations in the design of the vehicle. With the improvement in the gasoline motor bus, however, a better type chassis became available for trolley buses and the newer vehicles are proving far more satisfactory than the old. More than 1,100 of these trolley buses are now in service in the United States and about 2,500 in Great Britain. London has about 600 in service and plans to replace its remaining tram lines during the next few years, thereby bringing its total of trolley buses to about 1,000. Moscow also has a large program in prospect which will probably double the 389 trolley buses now operated there. Other cities all over the world are keenly interested in this development and the next few years may be expected to see a rapid increase in the number of units in operation.

From the technical standpoint the development of the so-called "all-service" vehicle in use on the lines of Public Service Co-ordinated Transport in New Jersey has attracted attention. This is a very flexible combination trolley bus and gas electric motor bus which can be operated under its own power or by power obtained from overhead electric wire. Some 500 of these vehicles are now being operated by the New Jersey company, and several other companies are experimenting with them. The added first-cost and extra weight involved in having duplex sources of power will prob-

ably tend to limit their use to locations where flexibility is of great importance, however, and trolley bus expansion may be expected, in the main, to follow more conventional lines.

## Elementary Education.

Recent developments in elementary education have been characterized by three major trends. The first centres around a modified conception of the nature of the child and the learning process growing out of more recent findings in psychology, biology, and anthropology. The second has to do with a reconstructed curriculum and the third involves changes in the role of the teacher occasioned by a new conception of leadership and administration.

The sciences which throw light on human nature and behaviour conceive human beings to be unique dynamic organisms, which react as totalities, which are essentially social and in constant process of growth and change. Studies of learning take account of these characteristics of the human organism and lead to a conception of the learning process which holds life and learning to be integrally related. The child learns by living. Anything to be really learned must be actually lived. Essentially this is a creative conception of learning. Since every child is unique and capable of some creative effort different from that which can be put forth by any other human being, learning becomes a process of self realization. Learning is living in such a way as to make the most of one's potentialities. Teaching is helping people to live so as to make the most of their possibilities.

Self realization as here considered has an essentially social setting. Individuals can realize their greatest attainments only as they make the greatest contributions to the enrichment of the social group. Respect for personality is a social concept. The only way to attain a school or a society in which each personality is respected is to evolve a school or society in which each person so lives that he respects the personality of every other individual. Thus, while the newer conception of the learning process stresses creative growth along unique lines for individuals, it simultaneously places greater emphasis upon social attitudes, social responsibility and self discipline.

The above conception of the human organism and of the learning process is in large part responsible for the reconstruction taking place in the curriculum, in the life of the school. Instead of being composed of fixed bodies of subject matter, the curriculum is in constant process of growth and change. Instead of being uniform for all pupils, it has almost endless variety as it responds to the needs of millions of children. The social emphasis has made a school within four walls an impracticable venture. On the contrary, the entire community must be brought into play, including homes, churches, community organizations, museums, libraries, social settlements, and industrial enterprises. Study of the community is thus a substantial element in the curriculum. The end of such study is purposeful participation in social living.

Education as described above cannot be achieved in an authoritarian setting. As an educational philosophy becomes more integral in character it calls for a more integral implementation. This means that every aspect of the school and society will be examined in order to find out what is its bearing on the success of the educational enterprise. Such examination has found our administrative conceptions in conflict with our educational aims. Accordingly there is being evolved a new pattern of educational administration and leadership. Under this pattern leadership emerges from the life of the school and is determined by the life of the school instead of being itself a force which controls the school. Such leadership demands a new role for the teacher in which he is viewed, not as a mere hireling, but as a professionally competent leader who is himself to make the really important decisions in his daily activities. Leadership must thus be creative and democratic as education is creative and democratic.

More than any other level of education, the elementary school reflects the true spirit of American education. It is in the elementary school that educational practice approaches our educational theories most closely. It is here that experimentation

CHILDREN IN SKOKIE JUNIOR HIGH SCHOOL, Winnetka, Illinois, learn how to use a library by acting, in turn, as librarian

SCENE IN THE NURSERY DEPARTMENT, where parents as well as children are trained in child education

flourishes with the least interference and it is from this level of education that newer techniques and procedures are adopted. For these reasons current trends in elementary education are likely to be indications of future trends in the higher levels of education. Thus both educators and laymen will be interested in the developments in elementary education both for their own sake and as a barometer of educational trends generally. (E. O. M.)

**Great Britain.**—The issue of an entirely new volume of *Suggestions for the Consideration of Teachers* (Board of Education 1937), is as notable a landmark in the history of English education as was that of the original volume 30 years ago. Physical education, hygiene, and craftwork all receive marked attention, the League of Nations is discussed as a "subject" in an appendix, and the influence of mechanical aids to education is felt throughout the work. The senior school is indeed the dominant theme, as it has been the dominant interest, of English educational administration for nearly 20 years. Not yet has the junior school received its own proper attention, though nursery schools for different reasons have obtained increasing support.

Two related but contrasted problems have occupied the educational stage in 1937: the problem of a shifting population and the creation of child-congested areas in the new housing estates on the fringe of every large city, and that of the falling child-population, particularly felt in the older parts of a city, so that while new schools in the outer ring are overcrowded as soon as built, reconditioned schools in the inner ring are found too large for present requirements. The tendency therefore is to think of elementary education, particularly at the senior school stage, increasingly in terms of club or communal organization, so that in both inner and outer rings school buildings will be used for a variety of educational and social purposes throughout the week, both during the daytime and the evening, and not be left empty and unused, as in times past, on two days of the week.

The reorganization of primary education in accordance with the famous Hadow report continues, not only in terms of buildings, playing fields, and general amenities, but also in terms of a re-orientation of studies. There has been much activity in raising the status and enlarging the scope of craftwork and of the other so-called "leisure" subjects. To promote this, the Board of Education issued a circular (1453) calling upon local education authorities, universities, and training colleges to make more systematic provision for refresher courses for teachers than is possible under the long established and still valuable vacation courses. (See EDUCATION.) (A. A. C.)

**Elizabeth, Queen** (1900— ), Queen-Consort of Great Britain and Ireland; youngest daughter of the 14th Earl of Strathmore and Kinghorne, K.G., K.T., born at St. Paul's Waldenbury, Herts, Aug. 4, 1900; married H.M. King George VI (then H.R.H. the Duke of York), April 26, 1923; has two daughters, the Princesses Elizabeth (b. 1926) and Margaret Rose (b. 1930). On his birthday, three days after his accession to the throne on Dec. 11, 1936, the King conferred on her the Order of the Garter, and in Feb. 1937 she was appointed Dame Grand Cross and Grand Master of the Royal Victorian Order.

On May 12, Her Majesty was crowned with the traditional ceremonial, after her husband, in Westminster Abbey, and took part with the King in the celebrations that followed the event, including the drives through London, the State banquets, and the Spithead naval review. On July 7, during the royal visit to Edinburgh, Her Majesty's installation as Lady of the Order of the

Thistle took place in St. Giles's cathedral, she being the first woman to be admitted to that historic order, which had been bestowed on her on May 11.

At the end of July, she accompanied the King on his visit to Northern Ireland, and Oct. 16 inspected the London Scottish, of which regiment she is honorary colonel.

**Encyclopaedias.** The promise made in 1929 that the 36th and final volume of the *Enciclopedia Italiana* would be issued in 1937 was fulfilled in November, when Senator Treccani, founder of the Istituto Giovanni Treccani, under whose auspices it was undertaken and whose generous use of his profits from armament manufacture during the World War had made its inception possible, presented the final volume to Signor Mussolini. In spirit and even in form this great work avowedly took the *Encyclopædia Britannica* as its model, though being a State-aided undertaking, it was able to exceed the *Britannica* in bulk of content; its sumptuous illustrations especially mark an epoch in the history of reference-books.

In Great Britain and America the *Encyclopædia Britannica* produced a special coronation issue of the current edition, incorporating among other changes those rendered necessary by the court events of 1936-37. The present *Book of the Year* is the first of a series of annual supplements to the *Encyclopædia Britannica*. The great demand for encyclopaedic information in popular form has in the past few years led several American and British newspapers to publish encyclopaedias for cheap circulation among their readers. The great *Russian Encyclopaedia*, begun in 1926 under the aegis of the Soviet Union Government, is now (1938) about three-quarters complete; though, as in the case of the *Oxford English Dictionary*, whose supplementary volume appeared in 1933, the volumes have not been published in alphabetical sequence. The *Encyclopédie Française*, arranged non-alphabetically, is planned to occupy 21 volumes, of which 8 have already appeared. The 21st and final volume of a Hungarian *Nagy Lexicon* was published in 1935, and a concise one-volume *Kis Lexicon* in 1936. An 8-volume *Estonian Encyclopaedia* was published in 1937. In Germany, a new and extensive State-aided encyclopaedia on Nazi lines is in course of publication.

**Endocrinology.** The last few years have seen an unprecedented advance in our knowledge of the chemical co-ordination of the body, particularly co-ordination by means of hormones. The chief features of recent research have been firstly, the recognition of the anterior pituitary body, hitherto an organ little understood, as the control centre of the endocrine system; and, secondly, the isolation, characterization, and in some cases partial synthesis, of the substances produced by the glands controlled by the anterior pituitary body. The manifold effects of removal of the pituitary have long been known, but full appreciation of their significance was delayed. Following hypophysectomy (surgical removal of the pituitary body) there are marked changes in the thyroid and adrenal glands, and in the ovaries or testis, as well as in carbohydrate metabolism, blood chemistry, and rate of growth. These effects of hypophysectomy can be wholly or partially abolished by admin-

istration of extracts of the anterior pituitary which will stimulate the thyroid and adrenal glands to increased physiological activity. Not only is the internal secretion of the gonads stimulated, but also the maturation of ova and spermatozoa. It is customary to refer to these various activities of the anterior pituitary as thyrotropic, adrenotropic, and gonadotropic. The gonadotropic effect is probably brought about by more than one substance—by as many as three according to certain authors. Similarly, extracts can be made of the anterior pituitary body which will restore growth in the hypophysectomized animal, or increase the growth of the immature animal. The effect on carbohydrate metabolism is shown by the capacity of extracts of the anterior pituitary to raise the blood sugar and to decrease the sensitivity of the animal to insulin. In certain cases, the full diabetogenic effect—namely excretion of sugar and ketones in the urine—may be observed. The pituitary substances responsible for these manifold effects have not yet been isolated or identified, but they are undoubtedly protein-like in nature, and their chemical properties contrast strongly with those of the hormones secreted by the adrenals and gonads. Thus, they are destroyed by heat in the presence of water; they are insoluble in organic fat solvents, but soluble in water; and they are stable in mild acids and alkalis. The adrenotropic, thyrotropic, and gonadotropic hormones are distinguished by the fact that they act upon a second gland, which is thereby stimulated to secrete hormones to effect the characteristic changes in the end-organ. Another pituitary hormone, however, whose existence is well established, acts directly upon the end-organ. This is the hormone responsible for causing the secretion of milk by the mammary gland, and in pigeons for the thickening of the glandular crop lining responsible for the production of pigeon's "milk."

**Adrenal Cortex.**—It has been established for some time that removal of the adrenals is incompatible with continued survival of the animal, and, further, that this lethal effect is due, not to the removal of the adrenalin-bearing medulla, but to the removal of the cortex of the gland. The symptoms preceding death caused by adrenalectomy seemed to be due largely, if not exclusively, to the disturbance of the metabolism of salt and water. The lethal action of adrenalectomy is so definite that extracts of the cortex can be tested biologically for their power to promote survival, but the minute amounts of active substance present in the gland have made the concentration and purification of extracts a laborious affair. Nevertheless, among the large number of crystalline compounds separated from cortical extracts by Reichstein, there seems to be at least one which has the full survival-promoting power of cortical extracts. It is certain that the constitution of this substance, corticosterone, will shortly be ascertained, and already a semi-synthetic product, having one-third of its biological activity, has been produced from the hormone of the corpus luteum (*see below*). Recent research on the adrenals has also led to the discovery that they contain relatively large amounts of substances similar in biological activity to the gonadal hormones, and this provides a link with the clinical observation that tumours of the adrenal cortex may lead to the appearance of masculinity in women and femininity in men.

**Testis.**—The well-known effects of castration indicate that the testis has a vital influence upon the accessory male organs of reproduction and upon secondary sexual and other bodily characters. Only recently, however, have extracts of testis been prepared capable of replacing in the castrated animal the endocrine activity of the intact organ. Koch and Gallagher were able to produce from bull testis a concentrated extract capable of causing growth of the atrophic comb of the castrated cock or capon, the most convenient test available. They were subsequently able to elaborate a number of tests on the castrated rat and to effect

a quantitative standardization of extracts. The proportion of active material present in the tissue was again minute, and not until 1935 was the essential hormone of the testis, now known as testosterone, isolated from testis extracts by Laqueur and his co-workers and chemically characterized. In the meantime, Butenandt, working on the discovery that extracts with similar activity could be prepared from male urine, had produced from that source a crystalline substance with biological properties similar to those shown by testis extracts. The name androsterone was applied to this substance, since at that time it was supposed to be the essential male hormone. The chemical constitution suggested for this substance by Butenandt was confirmed by Ruszicka in the course of a brilliant piece of work, in which androsterone was prepared artificially from cholesterol. A somewhat similar technique was subsequently used for the artificial preparation of testosterone from cholesterol, and what appears to be the essential hormone of the testis is now available in large quantities. Both androsterone and testosterone are *cyclopentenophenanthrene* derivatives. Androsterone is fully saturated, and has a hydroxyl group in position 3 and a keto group in position 17. Testosterone has one double bond ( $\Delta^4$ ), and is a 3-keto, 17-hydroxy compound.

**Ovary.**—The early work of Allen and Doisy on the preparation of ovarian extracts was followed by Zondek and Aschheim's discovery that highly active extracts with similar biological properties could be prepared from the urine of pregnant women, and for a time the centre of interest shifted from the ovary. The high concentration and the comparative lack of inert material in pregnancy urine made possible a rapid advance in chemical methods of preparing active extracts, and in a short time two active substances had been isolated. These are now known as oestrone and oestriol. They are of somewhat similar constitution to the male hormone described above, but they contain a benzene ring and their artificial production has not yet been achieved. These substances were commonly supposed to represent the essential female hormone as it was actually secreted by the ovary, but further research by Doisy and his co-workers resulted in the isolation, from sows' ovaries, of a third substance now known as oestradiol. This substance, which is considerably more active than oestrone, had already been produced artificially by the partial hydrogenation of oestrone, but the claim of the chemist to have improved on nature was short-lived in view of oestradiol's ultimate isolation from the ovary. The substances described are responsible for only one phase of the female reproductive cycle, namely, for the changes associated with the time of maturation and ovulation of the Graafian follicle in the ovary. The second and no less important phase of the cycle comes after ovulation, when the corpus luteum develops from the shell of the ruptured follicle, and the uterus undergoes coincidental changes designed to facilitate the implantation of the fertilized egg. This second phase of the cycle was thought, from the evidence of functional correlation, to be under the control of a hormone produced by the corpus luteum, and experiments resulted in the production of extracts capable of inducing in the immature or ovariectomized animal suitably sensitized with oestrone the usual post-ovulation changes of the accessory organs. Small amounts of crystalline hormone were eventually produced from corpora lutea and its chemical characterization was effected. The name progesterone was agreed upon by the various workers concerned. The artificial production of this rare substance was afterwards achieved from stigmastanol—a steroid related to cholesterol—found in soya bean oil. Unlike the male and female hormones, progesterone does not seem to be excreted in the urine in an active form, but an inactive compound—pregnanediol—previously isolated from pregnancy urine, has now been recognized as the probable excretion

product of the hormone of the corpus luteum. This substance can be obtained in fair quantity from urine, and can be converted back to the active progesterone by a comparatively simple process.

**Integration of the Endocrine System.**—It is clear that the primary regulation of the system is due to the stimulating activity of the anterior pituitary body. It is equally evident that certain of the organs directly or indirectly controlled, particularly the ovary and uterus, must be able to exert an effect in their turn upon the anterior pituitary. Thus the implantation of a fertilized egg in the uterine endometrium is by some means effective in causing the persistence of the corpus luteum in the ovary, and this change in the ovary interrupts the pituitary cycle so as to bring about the endocrine conditions necessary for successful gestation. In the same way, inter-relationships exist, possibly directly between the thyroids, adrenals, and gonads. (A. S. PA.)

**England:** see GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.

**English Literature.** It is but fitting that this survey of English literature during 1937 should, before anything else, pay the brief tribute of a mention to some of those writers who have for ever laid down their pens. It has been necessary to record during the year the deaths of Sir James Barrie, John Drinkwater, Joseph Hocking, and Lieut.-Col. Cyril McNeile (more recognizable under his *nom-de-plume* of "Sapper"). Another, though not so direct a loss to English literature, was caused by the death of its great interpreter to the French, Professor Émile Legouis.

A notable little group of books is made up, entirely or in part, of the posthumously published work of three literary giants who died before the beginning of the year under review. Kipling's autobiographical *Something of Myself: For my Friends, Known and Unknown* was most accurately entitled by its author: "Something" is the operative word; yet enough is here to bring a measure of satisfaction to any but some of the most unilateral admirers of this many-sided genius. A few more poems to add to the published output of A. E. Housman are included in Laurence Housman's *A. E. H.*—not, as was in the nature of things, of the same water as the poems of the two great little volumes, but still precious enough. This book also contains some valuable letters by "A. E. H." In connection with G. K. Chesterton's *The Paradoxes of Mr. Pond*, it is, perhaps, permissible to express a sense of thankfulness that the master's reputation stood in no need of enhancement by this last of his books; yet how gladly would we read many more such books from that pen!

Before attempting anything in the nature of a systematic review of the various types of literature, mention should be made of one special type evoked by the coronation and its antecedent circumstances. It is a little incongruous that the most noteworthy of the books begotten of the coronation should owe its inclusion in this survey to its translation from the German by L. G. Wickham Legg; but it is generally acknowledged that Dr. P. E. Schramm's *History of the English Coronation* was bettered by no native Englishman's book upon the subject, though there is evidence of documentary research in J. G. Noppen's *Royal Westminster*. Hector Bolitho's biographies of *Edward VIII* and *George VI* may be mentioned here, as also may be, and without comment, Geoffrey Dennis's *Coronation Commentary*. The centenary of Queen Victoria's accession had also its own literature, among which Margaret Lambert's *When Victoria Began to Reign* may be singled out.

One of the most significant indications of the general trends of English literature in these days lies in the fact that in no survey can pride of place be given to poetry. There are still,

and it is to be hoped that there will always be, poets and experimenters in verse forms; but it has to be admitted that they occupy the attention of only a fraction of the reading public. The stream of fiction, good, bad, and indifferent, continues in full flood; but it is the large and varied output of works of biography, reminiscence, and travel that is most characteristic of the country's literature.

Of the considerable number of autobiographies published during the year, Kipling's has already been mentioned. It is fitting that a word or two should be written of Barrie's *The Greenwood Hat*. Much of this little book is autobiographical, sharing with the reader, pleasantly but all too briefly, its author's reminiscences. Filial piety, together with personal recollections of middle-class life in late Victorian London, are finely embodied in Herbert Asquith's *Moments of Memory*; and in *As I Was Going Down Sackville Street*, Oliver St. John Gogarty produced a work on the same high plane of scholarship. Among other memorable books of personal reminiscences were *Georgian Adventure*, by Douglas Jerrold, the Duke of Portland's most readable *Men, Women, and Things*, and J. B. Booth's *A Pink 'Un Remembers*, which must bring a sigh of regret from those who were in their prime vigour in the London of the opening years of the present century. It is, indeed, difficult to know where to stop in recalling the year's output in this class of literature: the field was entered by, among others, such stalwarts as H. A. Vachell, S. P. B. Mais, and Noel Coward. But it is necessary to mention two remarkable books which, though not autobiographies, are based on their authors' personal reminiscences: Harold Nicolson's life of Lord Dufferin, *Helen's Tower*, and V. Sackville-West's *Pepita*, a life of her mother and grandmother which convincingly illustrates the truth of the adage that "Truth is stranger than fiction." More directly autobiographical are Jack Jones's *Unfinished Journey*, G. A. W. Tomlinson's *Coal Miner*, and Andrew Smith's *I Was a Soviet Worker*, all of which, written by working men, have considerable literary as well as sociological value. Another book which may fittingly be mentioned here is *Coming, Sir!*, in which its author, Dave Marlowe, relates his experiences as a waiter.

One of the great figures of the year, Lord Baldwin, found a biographer in Arthur Bryant. There was, also, an interesting group of biographies of men who are still within living memory. A prominent place among these must be accorded to Professor G. M. Trevelyan's peacefully and nobly written *Grey of Fallodon*, and to Sir Frederick Maurice's minutely thorough first volume of his *Haldane*. Winston Churchill's *Great Contemporaries* has that quality of brilliance which must be expected from its author, and a stirring story is told in Frank O'Connor's life of Michael Collins, *The Big Fellow*. Labours of love were faithfully performed by John Eglinton in *A Memoir of A. E.* and by M. Tschiffely in *Don Roberto*, a portrait of R. B. Cunninghame Graham; and, in this connection, it is right to call attention once more to Laurence Housman's *A. E. H.*

Although the book is not strictly a biography, it is permissible to mention here Humphrey House's editing of *The Notebooks and Papers of Gerard Manley Hopkins*.

There was a very large number of biographies of characters belonging to the more distant past, among them being *John Knox* by Lord Eustace Percy, Algernon Cecil's *A Portrait of Thomas More*, Cyril Hughes Hartmann's *Clifford of the Cabal*, A. L. Rowse's *Sir Richard Grenville of the Revenge*, Sir Charles Petrie's strongly written *Bolingbroke*, and D. M. Low's *Edward Gibbon*. An interesting, if fortuitous, occurrence was the publication in the same year of Maurice Ashley's *Oliver Cromwell*, *The Conservative Dictator*, and of *King Charles and the Conspirators*, by Esmé Wingfield-Stratford. The first Roman emperor was the subject of two historical studies: *Augustus* by John Buchan, and G. P.

Baker's *Augustus, "The Golden Age of Rome."*

Dr. G. B. Harrison's Elizabethan scholarship was seen in his *Life and Death of Robert Devereux, Earl of Essex*.

Biography and history shade into each other in *The Amberley Papers: The Letters and Diaries of Lord and Lady Amberley*, edited by Bertrand and Patricia Russell. This book may not have a very wide appeal, but it is of immense interest to the student of the psychological tendencies at work during the '50s and '60s of the last century. Equally interesting on a rather different spiritual plane is Dilys Powell's translation of *The Private Letters of Princess Lieven to Prince Metternich, 1820-1826*. A delightful contribution to our knowledge of 17th-century England is made by Gladys Scott Thomson's *Life in a Noble Household*, in which the first Duke of Bedford and his family come to life again through their domestic accounts.

It is impossible to leave this field of biography without reference to so notable an occurrence as the publication of another supplementary volume to the *Dictionary of National Biography*. This, which includes those who died in the period 1922-30, is particularly rich in its material.

This is, perhaps, the most appropriate point at which to turn to purely historical and political works; and, taking first some books of contemporary interest, we find Capt. B. H. Liddell Hart analysing with all his wonted acumen a situation aptly described by his title *Europe in Arms*. Born of Spain's agony are Professor E. Allison Peers's *Catalonia Infelix* and Martin Armstrong's *Spanish Circus*. But it would be too invidious a task to attempt a selection from the group of books concerned with the rival political ideologies so much before the public mind at the present time; and for this very reason there is all the more cause to refer to Lionel Curtis's brave attempt, in the final volume of *Civitas Dei*, to suggest what things ought to be but are not.

To the vast majority of readers, literature means fiction; and, whatever may be thought of their quality, there was no noticeable falling off in the number of novels published during the year. One of the most successful novels of the year was Francis Brett Young's *They Seek a Country*, and another was Dr. A. J. Cronin's onslaught upon the modern medicine-man in his less laudable manifestations, *The Citadel*, written with obvious sincerity tempered by the necessary degree of artistic restraint. Storm Jameson's *The Moon is Making* is less derivative than the greater part of nearly all novelists' work. Those who like a rousing sea-story were well served by H. M. Tomlinson with his *All Hands*. H. G. Wells has been as prolific as ever, and those many who find more to delight them in his early than in his later work will have been gratefully surprised to find something, at least, of the old spirit recaptured in *Brynhild* and *Star-Begotten*.

Others of the old brigade who served their public faithfully were Sir Hugh Walpole with his fairy tale, *John Cornelius*, Compton Mackenzie with two huge instalments of *The Four Winds of Love*, Frank Swinnerton with *Harvest Comedy*, H. A. Vachell with *The Golden House*, Somerset Maugham with *Theatre*, Gilbert Frankau with *The Dangerous Years*, Robert Hichens with *Daniel Airlie*, Eden Phillpotts with *Farce in Three Acts*, Michael Sadleir with *These Foolish Things*, and Richard Aldington with *Very Heaven*; and this is very far from exhausting the list of established favourites.

*The Years*, by Mrs. Virginia Woolf, must be reckoned one of the year's successes: its outlines lack something in definition, but it has much of the stuff that dreams—nice dreams—are made on. In a year in which the subject of divorce was in the foreground of discussion, Miss E. M. Delafield's *Nothing is Safe* came appropriately enough with its reminder, if such were necessary, that there may be other parties concerned, younger and even more vulnerable than the most patently innocent principal. Miss Helen Simpson's

*Under Capricorn* belongs, properly speaking to Australian literature. The unflagging Mrs. Beatrice Kean Seymour gave us further proof of how well she understands her own sex in *The Happier Eden*. There was originality and vividness in Miss Margaret Lane's *At Last the Island*.

Some of the best of the year's historical novels were written by women, among them being *No Hearts to Break* by Miss Susan Ertz, and Mrs. Hicks Beach's *A Cardinal of the Medici*. Other romances in this category include David Pilgrim's *So Great a Man*, with Napoleon for its theme, and *The Lost King* by that inveterate story-teller in this kind, Rafael Sabatini.

All those to whom A. Neil Lyons's *Arthur's* has been a cherished classic for some 30 years must have been overjoyed to find this writer reproducing so much of the genius of that immortal collection in *Tom, Dick, and Harriet*. This was one of the most remarkable "comebacks" of a year which had also its due share of successful new-comers. *The Wild Goose Chase* by Rex Warner, and Geoffrey Household's *The Third Hour* were first novels in which critics discerned a more than ephemeral promise; and there were other books whose authors may well be congratulated upon a successful first plunge into the treacherous seas of fiction: Olivia Manning's *The Wind Changes*, C. P. Rodocanachi's *No Innocent Abroad*, Frances Harris's *Fain Would I Change*, and Fanny Jocelyn's *And the Stars Laughed* are little more than a random choice, the justice of which, as always in such cases, may well be outweighed by the injustices of its omissions.

It cannot be disguised that these are lean years for poetry in English literature, and the year under review is no exception in this respect. It might well be contended that the handful of final gleanings from A. E. Housman's previously unpublished work was poetically at least the equal of any other work published during the year. Nothing came from the pen of W. B. Yeats, the one indisputably major poet remaining with us. But much was done to rescue the year from utter mediocrity by the poet laureate, for the poetry of true patriotism, well attuned to public thought in a year of national emotion, informs the 42 poems of Mr. Masefield's *The Country Scene*. After the laureate, it is fitting to refer to W. H. Auden, who in 1937 was awarded the King's Gold Medal for poetry. This author's most interesting and most successful publication during the year was written in collaboration with Louis MacNeice, and is by no means exclusively poetical; for *Letters from Iceland* is a medley of all sorts of writing, for the most part satirical without being too spleenful. Mr. Auden also published a poem, *Spain*, in which his political sympathies have not entirely extinguished the poet. Two volumes of *Collected Poems* appeared during the year: one, under that title, by Laurence Housman, and John Drinkwater's *Collected Poems, Volume III*. Richard Aldington put at least some genuine poetry into his *The Crystal World*.

Two frankly communist young poets, Charles Madge and Rex Warner, the former in *The Disappearing Castle* and the latter in *Poems*, showed that they are at times not incapable of poetical thought and expression. *Straight or Curly?* by Clifford Dymont was welcome to ears attuned to an older convention of verse form.

The radio as a medium for verse drama was the direct begetter of Archibald MacLeish's *The Fall of the City*, a most interesting experiment in a new form, with which it is to be hoped that its author will persist. Of well-established writers, we have Edmund Blunden's *An Elegy*, and Humbert Wolfe's vitriolic *Don J. Ewan*.

In belles-lettres and criticism there was during the year a wide range, if the total quantity was not great. Works of general poetic criticism included D. G. James's *Scepticism and Poetry*; Rostrevor Hamilton's *Poetry and Contemplation*, and *Illusion and Reality* by "Christopher Caudwell"—a *nom-de-plume* which veils the identity of Christopher St. John Sprigg, who died during the

## ENTOMOLOGY

year fighting for the Government cause in Spain. Further light has been shed upon the lives of one or two of the great writers of the past, and this is especially true in the case of Keats; for there were published during the year not only F. Edgcumbe's editing of *The Letters of Fanny Brawne to Fanny Keats*, but also Marie Adami's *Fanny Keats*. The former of these books did anything that was still needed in the matter of dispelling the old misconceptions concerning Fanny Brawne.

Reference may here be made to Townsend Scudder's *The Lonely Wayfaring Man*, a study of Emerson, to the further instalment of E. de Selincourt's edition of *Wordsworth Letters*, to James Sutherland's *Defoe*, and finally, once again, to Laurence Housman's *A. E. H.* Edward Garnett provided an introductory essay to his *Conrad's Prefaces to his Works*; and volumes of essays were produced by G. M. Young in *Daylight and Campaign*, by E. V. Lucas in *All of a Piece*, and by Lord Hewart in *Not Without Prejudice*.

A consideration of the literature of Science brings immediately to mind the loss sustained by the death of Lord Rutherford, whose intriguing little book *The Newer Alchemy* records the seemingly incredible in a matter-of-fact manner. (J. D. C.)

**Entomology.** Nearly 500,000 species of insects are now known and hundreds of thousands of additional species are yet to be discovered. These tiny animals are found in all countries, under all variety of climatic conditions from the tropics to the arctics. Some attack man directly, others transmit the organisms of human diseases, while many attack all kinds of fruits, grains, forage crops, stored foods and even the dwellings man constructs for his shelter.

The following brief discussion is intended to give a general view of some of the principal points at which these tiny, virile animals impinged on the lives and activities of men during the year 1937.

**Injurious Insects of the Past Year.**—Many species of insects have been distributed through the activities of commerce, around the world. Through their ability to adapt themselves to all sorts of conditions, they have become established in many countries, have multiplied enormously and have become very injurious. The common cotton bollworm moth, *Heliothis (armigera) obsoleta*, is found from the East Indies and Australia to Japan, India, Europe and North and South America. The larva attacks cotton, corn, tomatoes, tobacco and many other plants. It is always injurious and in the past year was markedly so in certain cotton-producing countries of the world. Another small, dark, grayish-brown moth, *Pectinophora gossypiella*, is present throughout cotton-growing countries, Egypt, India, Africa, Brazil, Mexico and in portions of the south-western United States. Its larva, the pink cotton bollworm (weevil), attacks the flowers and bolls of the cotton plant, and during the past year it was actively injurious.

The armyworm, *Cirphis unipuncta*, is also cosmopolitan for it occurs in Australia, New Zealand, China, India, Europe and in South and North America. The greenish striped caterpillars often become enormously abundant and march gregariously over the ground in search of fresh food—corn, oats, barley and other grains and grasses. Outbreaks of the insect, especially in the United States, occurred in 1937. The San José scale *Aonidiella (Aspidiotus) perniciosus*, a native insect of China, has spread around the world and has proved to be a most pernicious enemy of the peach, plum, pear, currant, and apple. It was a serious pest to the foregoing fruits in many localities during the past year.

The corn (maize) borer, *Pyrausta nubilalis*, ranges from Guam and the Philippines to Japan, through all of Asia, central and southern Europe and northern Africa to America (U.S.). It attacks corn, millet, sorghum, hemp, hops and other plants. It was

TRENCH USED in combatting a destructive farm pest, crickets

active during the year in Japan and China and persistently extended its territory and injuries in the United States and Canada. The gipsy moth, *Porthetria dispar*, present throughout Europe, western Asia, northern Africa, and quite certainly in Japan and China, periodically defoliates large areas of deciduous trees in Europe and caused severe defoliation in the north-eastern United States during the past year.

Termites, distributed around the world in tropical and temperate regions, have been destructive to ties, mine props, telephone and telegraph poles, bridges and wooden structures of all kinds, especially the dwelling houses of man. *Reticulitermes flavipes* in the eastern United States and in certain regions along the Mediterranean, *R. hesperus* and *R. tibialis* in the western United States, and other species in Central and South America, in South Africa and in Asia have been increasingly destructive.

**Notable Fruit Insects of the Year.**—All fruits are subject to the attacks of insects. A list of 275 species of insects attacking the vine has been compiled. The apple serves as host to several hundred species of insects although not all are injurious. That serious enemy of fruits, the San José scale, has already been mentioned.

The grape phylloxera, *Phylloxera (vastatrix) vitifoliae*, a member of the family of aphids or plant lice, is of nearly world-wide distribution. It is, undoubtedly, a native parasite of the wild grape of the United States. It is especially destructive to the European type of grape. French authorities have spoken of its introduction into France as follows: *Le désastre phylloxérique fut sans précédent dans les annales du monde agricole*. It was

a major pest of the grape in Europe and in California during the past year.

The red scale, *Aonidiella aurantii*, has become distributed throughout the tropical and semitropical regions of the world and in many regions, especially in South Africa and the western United States, constituted one of the chief troubles of the grower of citrus fruits of the year. The codling moth, *Carpocapsa pomonella*, a major pest of apples, is found in all of the apple regions of the world. The larva, which also attacks the pear, quince, and English or Persian walnut, took its annual toll during the year in South Africa, the United States and Canada and was severe in England.

The flies of the family, *Trypetidae*, known as fruit-flies are cosmopolitan and among the worst pests of fruits in many countries. The Mediterranean fruit-fly, *Ceratitis capitata*, is present on every continent except North America although it occurs in nearby Bermuda. It caused serious injury in various parts of its range to a wide variety of fruits, especially citrus fruits, peaches, apricots and figs. The olive fly, *Dacus oleae*, is also a most injurious species. In Italy and Spain it caused great losses to the olive industry.

In the United States, the apple maggot, *Rhagoletis pomonella*, and the cherry maggots, *R. cingulata* and *R. fausta*, were the important members of the fruit-fly group during the year. The Mexican fruit-fly, *Anastrepha ludens*, which attacks grapefruit and oranges and other fruits, has entered the lower Rio Grande valley in the United States.

**Locusts or Grasshoppers.**—Among the greatest insect scourges of all time have been the enormous swarms of locusts sweeping across vast areas and destroying all vegetation in their paths. In parts of Russia, western Asia, Egyptian Sudan, South Africa, Argentine and the west-central United States and in portions of Canada, locusts are, at the present day, among the most destructive insects with which the people have to contend. The chief migratory locusts of the Old World comprise two species, *Locusta migratoria* and *Locustana pardalina*. The former occurs from

A "DOZER," consisting of a screen and a trough of kerosene, drawn over fields to trap and drown grasshoppers in the Great Plains, U.S., worst plague of the insects since 1880

western Europe eastward through Asia and Northern and Central Africa to the Philippines. Serious trouble from it occurs somewhere in this vast area every year.

In South Africa there are four species of migratory locusts, the brown locust, *Locustana pardalina*, the red locust, *Nomadacris septemfasciata*, the tropical migratory locust, *Locusta migratoria migratorioides* and the desert locust, *Schistocerca gregaria*, which once constituted one of the Biblical Plagues of Egypt. Even today it swarms and "devastates crops in North and East Africa and Asia Minor." Both the brown and red locusts were destructive in South Africa in 1934, '35 and '36 and an outbreak of the red locust was expected in 1937.

In parts of United States and Canada, grasshoppers were destructive during 1936 and, on the whole, were worse in 1937. Four species were concerned in the States of North and South Dakota, Nebraska, Kansas and some neighbouring States. These were the lesser migratory locust, *Melanoplus mexicana*, the differential grasshopper, *Melanoplus differentialis*, the two-striped grasshopper, *Melanoplus bivittatus*, and the red-legged locust, *Melanoplus femurrubrum*.

**Chief Stored Grain Insects of the Year.**—The many insects infesting stored grains and dried foods have been carried around the world with the materials in which they live. They were active everywhere and caused great losses during the year. The saw-toothed grain beetle, *Oryzaephilus surinamensis*, reddish-brown and about 2.5mm (1/10in.) in length, has spread over the earth. It infests meal, flour, breakfast cereals, and occasionally cornstarch, ginger, macaroni, and dried fruits.

The pinkish-white larva of the Mediterranean flour moth, *Ephestia kuehniella*, infest flour mills and often find their way into homes in packages of flour and cereals. The cosmopolitan Indian meal-moth, *Plodia interpunctella*, feeds on grains of all kinds and often invades households in oatmeal, graham biscuits, raisins, dried currants, apples and peaches and in other fruits. The fig moth, *Ephestia cautella*, infests dried figs throughout the world.

The granary weevil, *Sitophilus granaria*, and the rice weevil, *Sitophilus oryzae*, two tiny blackish beetles, are among the most destructive insects in the world. They are cosmopolitan and are injurious to stored wheat, corn, barley, rice and other grains. They often enter households in packages of cereals.

**Insect Carriers of the Organisms of Human Diseases.**—Within the last few decades, remarkable discoveries have been made regarding the intimate relation of certain insects to some of the most virulent diseases of mankind.

Malaria, the most universal and devastating disease of man-

BOLL WORM attacking nearly full-grown cotton boll

kind, is disseminated by various mosquitoes of the genus, *Anopheles*. *A. maculipennis*, *A. ludlowii*, *A. quadrimaculatus*, and *A. albimanus*, may be considered the chief world offenders in perpetuating malaria. Thousands, nay millions of people in the Philippines, India, southern Europe, South and Central America and the southern United States suffered from this disease during the year and a large proportion of them died from the attacks.

In the eastern United States there appeared during the year a veritable epidemic of the common dog flea. This flea is not greatly to be feared although it may infect children with an intestinal tapeworm. It is the rat flea, *Xenopsylla cheopis*, that man needs to fear for it is a carrier of *Bacillus pestis*, the cause of Plague, one of the great scourges of mankind. China experienced an outbreak of the Plague during the early stages of the Sino-Japanese war.

The housefly is the greatest insect distributor of germs. It carries the organisms of typhoid fever, dysentery and cholera and, undoubtedly, was responsible for much illness and many deaths during the year. Typhus fever which takes its annual toll of human lives among the poor, half-starved peasants of south-eastern Europe and of Russia, is transmitted through the agency of the body and head lice of man.

Yellow fever, carried by the tiny mosquito, *Aedes aegypti*, although banished from North America, still rages in portions of Central and West Africa.

**Insects as Destroyers of Their Own Kind.**—It is an interesting fact that man has domesticated but two insects out of the existing thousands of species, the docile, harmless silkworm and the fiery honeybee. The lac insect, *Tachardia lacca*, not strictly domesticated, is reared on a large scale in India.

Investigation has shown that nearly, if not quite all, insects are preyed upon by members of their own tribe and kind. Hundreds,

nay thousands, of species of tiny wasp-like parasites are constant and deadly enemies of larger insects. Many predacious beetles, dragon-flies, robber-flies, and other tigerish forms are ever hunting out and devouring their kind.

Man has taken advantage of his knowledge regarding the destructive work of these parasitic and predacious forms and is slowly learning how to propagate them in quantity and to distribute them where they will attack and destroy the pests which are ravaging his crops. This work in the utilization of insects as destroyers of their own kind has been carried on during 1937 more methodically, intensively and intelligently than ever before, in Canada, the United States, England, France, Italy and Germany. (See MALARIA.)

**E.P.I.C.:** see SHARE-THE-WEALTH PROGRAM.

**Epidemics.** Each year finds the bulwark, which medical science has erected against disease, increasing in efficiency. Particularly successful have been efforts to control epidemics. In 1937, extensive community programs for the control of pneumonia were formulated in several States and cities. Further knowledge concerning the various types of pneumococci was obtained; antisera for specific types of pneumococci were developed. Horsfall and others claimed that rabbit serum might be superior to horse serum because of cheaper production, greater penetration, and less severe reactions. Nevertheless, antipneumococcic horse serum, as first advocated by the Rockefeller institute, continued to be widely employed.

The attention of the public was focused on syphilis by the activities of the U.S. Public Health Service, under the able direction of Dr. Thomas Parran. The attention of the medical profession was called to the need of better control of venereal diseases through the activities of Dr. Morris Fishbein, editor of the *Journal of the American Medical Association*, by his book on syphilis, through lectures, and by means of a motion picture prepared under his direction by the U.S. Public Health Service and the American Medical Association. During 1937, increasing knowledge of virus and virus diseases was obtained. Francis and others recovered a human influenzal virus from patients. Stokes and others showed the effectiveness of vaccination with human influenzal virus against an approaching epidemic.

The effectiveness of the administration of sulphanilamide, especially in Beta haemolytic streptococci infections, as well as its efficiency in meningococcus, gonococcus, and other infections, led the editor of the *Journal of the American Medical Association* to term it one of the greatest medical discoveries of 1936. In 1937, better knowledge of the manner in which sulphanilamide could be employed to increase its effectiveness led to the formulation of rules to prevent unnecessary reactions from its use.

With increasing travel from one part of the world to another, particularly in aeroplanes, new problems in the control of epidemic diseases have arisen. Diseases, which formerly were limited to one section of the world, are now brought close to parts where they were formerly unknown. There is danger of the spread of yellow fever to North America, by aeroplane. Certification of the origin of passengers and the fumigation of aeroplanes has been instituted. Smallpox may be brought by infected individuals from one country to another by aeroplane. Therefore, vaccination against smallpox, of all flying personnel is also being carried out.

New routes, for the administration of vaccines, have been constantly sought. A number of investigations of the intra-nasal route have been made. Jensen of Denmark gave intra-nasal instil-

ALL THAT GRASSHOPPERS LEFT of a Nebraska cornfield, and part of an estimated minimum loss of \$80,000,000 inflicted by a plague of the insects in the Great Plains, United States

lations of toxoid, following a one-treatment hypodermic injection of toxoid, and found 96% of the individuals so treated were protected against diphtheria, as shown by the Schick test. Definite evidence has been presented, showing that there is a marked increase in the incidence of trichinosis. It is beginning, therefore, to be recognized as a public health problem, requiring the institution of effective measures for controlling it.

Another important advance in the control of epidemics in 1937, was the demonstration of the effectiveness of a vaccine prepared by the Pasteur institute in the control of bubonic plague in Madagascar. Animals infected with *B. pestis* were found in Utah and neighbouring States, showing the desirability of search in other States for plague-infested animals and fleas. (H. Bu.)

**Episcopal Church:** see PROTESTANT EPISCOPAL CHURCH.

**Eritrea**, an Italian colony, now forming part of Italian East Africa, covering about 46,000 sq.mi., bounded N. and E. by the Anglo-Egyptian Sudan, S. by Ethiopia, and having a long coast-line (670mi.) on the Red sea; pop., Italians, 4,200; other Europeans, 370; natives, 596,000. Asmara is the capital, Massawah the chief port, and in April 1937 it was announced that a new port was to be built at Assab, at a cost of 80,000,000 lire. The natives, apart from a few Coptic Abyssinians, are Mohammedan; education is in the hands of the rigorously State-controlled Roman Catholic missions.

Agriculture and stock-raising are the chief industries but the country has never been self-supporting, and most of the Italian colonists are labourers imported at high wages for purposes of exploitation. In Nov. 1937, Marshal Traziani, their viceroy, stated that the finances were "on a fictitious footing"; and whereas the imports from Italy for the first three months of that year amounted to 345,900,000 lire (a vast increase), chiefly in cotton textiles, wine, tobacco, and foodstuffs, exports to Italy from the whole of Italian East Africa were only 51,900,000 lire.

Budget estimates for 1935-36 were: revenue, 144,059,004 lire, including a State contribution of 116,290,000 lire; expenditure (civil and military) balanced at this figure.

**Ernle, Rowland Edmund Prothero**, 1ST BARON (1851-1937), British agriculturist and writer was born in Clifton-on-Teme, Sept. 6, 1851. A biographical notice of him appears in the *Encyclopædia Britannica*, Vol. 8, p. 694. His work as minister of agriculture from 1916 to 1919, when he materially increased the home production of food, earned him a place in politics at least as high as that to which his writings entitled him in the world of letters. Lord Ernle took little part in public life after his retirement. He was president of the English Association, 1921-22, and of the Marylebone Cricket Club, 1924-25. Among the honours he received was the M.V.O. in 1901, and the gold medal of the Royal Agricultural Society in 1935; and the Grand Cross of the Greek Order of the Redeemer was also conferred upon him. His last considerable publication was *The Light Reading of Our Ancestors: Chapters in the Growth of the English Novel* (1927). He died at Wantage, Berks, July 1, 1937. On his death the peerage became extinct.

**Estonia**, republic of north-central Europe, N. of Latvia, member of the League of Nations. Capital, Tallinn (Reval) (seaport; 140,000). Pro-president, Konstantin Päts (appointed 1933). National flag, blue, black, and white horizontal stripes.

**Area, Population, and Cities.**—Area: 18,353 sq.mi., divided into 11 districts; population (1934): 1,126,413 (five-sixths Lutheran, though there is no State religion); 88.2% are Estonian,

8.2% Russian. Towns (1935): Tartu, 59,000; Narva, 24,000; Pärnu (seaport), 21,000.

Education figures: (1934-35) 1,246 elementary schools (obligatory and free); 62 middle schools; (1936) in Tartu (Dorpat) State university, 3,052 students.

**History, Trade, Finance, and Defence.**—A virtual dictatorship has prevailed since prorogation of the Diet (1934). A new constitution (the third; drafted in August) provided for: election of president for six years (universal suffrage; secret ballot); election of two chambers (29; 40) for five years; president's wide rights of veto; individual liberty and freedom of conscience. A sterilization law became applicable (April) to mental and physical defectives (not under 10 years, and with other reservations).

Farming supports 70% of the population; butter and poultry are exported. Nevertheless, industrialization is making strides (textiles, paper, oil, flax, leather); there is no unemployment, but a shortage of farm labour. Imports (1936); 86,846,000 kroons (£4,825,000); exports: 83,191,000 (£4,622,000); Great Britain takes two-fifths.

Currency unit: Estonian kroon (at par, 18.16 kroons = £1 = \$4.87). Budget (1936-37 estimate): 88,646,000 kroons. Notes (Bank of Estonia, three-quarters covered) 43,057,000 kroons.

Army (conscript; 1 year's service with colours) 1,313 officers, 9,310 others; 68 aeroplanes; navy: 1 torpedo boat, 4 gunboats, etc.—2 submarines are being built in England.

**BIBLIOGRAPHY.**—A. Pullerits, *Estonia* (Tallinn, 1935). (H. Fw.)

**Etching.** A survey of etching during 1937 reveals a continued development along the geographical lines followed in recent times. On the continent of Europe, France, after the golden era of the 19th century and since the death of such masters as Forain and Lepère, is producing more important work in line-engraving, woodcut, and lithography, than in the bitten line, though Villon, Féau, Jacquemin, Guastalla, Hasegawa (Japanese), Berger, Alix, Segonzac, Le Riche, Calevaert-Brun, Camy, Laurencin, Derain, Matisse, Braque, Picasso (Spanish), and Chagall and Kandinsky (Russian), are carrying on the great tradition of French art. The International Exhibition at Paris afforded an excellent review of contemporary work.

In Italy, Mauroner, Disertori, Chiappelli, Bianchi-Barriviera, Lipinsky, Galuzzi, and Mazzoni-Zarini, are representative, while Polish graphic artists of today have devoted themselves to the block-print, with the etcher Zakrzewski as an exception. In Hungary, on the other hand, etching flourishes in the hands of Vadász, Varga, Weil, Patkó, Emánuel, Barcsay, Kaveczki, Zador, Beron, Uitz, Bartos, Buday, Bottyány, and Julius Komjáti who continues to produce beautiful and significant plates. The Austrian Plankh, the Bohemian Coubine, and the Rumanian Negulesco, are conspicuous figures among the etchers of their respective countries. In Czechoslovakia there are Vondrous, Švabinský, Šimon, Stretti-Zamponi, Silovský, Boudà, Alex, and Stretti.

Holland and Belgium are carrying on their rich traditions of the past, the latter country comprehensively represented in the recent exhibition of Belgian graphic art at Brighton, England. Bagdatopoulos and George Constant, Greeks by birth but living in the United States, have worked on the copper, while Mukul Dey is India's exponent of the etching medium.

The modern German school continues with little change, though in the death of Max Liebermann it lost one of its most distinguished members. Kaethe Kollwitz and Otto Dix, however, remain and, in addition, are Beckmann, the sculptor Kolbe, Karsch, Kleinschmidt, Marcks, Heckel, Hofer, Sintenis, Nolde, and Gruner. Feininger, Edzard, and Roesch, are living in the United States and Kirchner in Switzerland. In Sweden, too, there is an independent and well established school, less affected than might

be supposed by the influence of Zorn. The internationally known Fridell died in 1936, but there remain Ahlquist, Borglind, Elgström, Engström, Fougstedt, Hedlund, Holmberg, Jansson, Johansson, Johanson-Thor, von Rosen, Sallberg, Sparre, Stallarholm, and Zanden. Their work is being shown throughout the United States in an exhibition of contemporary Swedish prints in return for a similar exhibition sent to Sweden by The Society of American Etchers early in 1937. Interesting work is also being done in Norway by Nordhagen and in Denmark by Stubbe and Christensen.

Artists in the United States share with Great Britain a greater activity in the field of etching than is taking place anywhere else in the world today, and the growing interest among laymen is demonstrated by the steadily increasing number of print societies and exhibitions. The Print Makers' Society of California, the Chicago Society of Etchers, and the Society of American Etchers are the three leading groups, although numerous others exist all over the country. Each sponsors an annual national and several travelling exhibitions, reflecting all the various influences which have manifested themselves in contemporary American print making. Any survey would include Butler, Chamberlain, R. Bishop, I. Bishop, Clark, Costigan, Ganso, Handforth (living in the Far East), Kappel, Landeck, M. Lewis, Lucioni, Marsh, Morgan, Nisbet, Rosenberg, Roth, G. Wright and R. S. Wright, Cook, Allen, Auerbach-Levy, Bacon, Berdanier, Brooks, Cadmus, Didur, Drury, Eby, Gallagher, Grant, Hall, Hansen, Heckman, Heintzelman, Higgins, Hoffman, Horter, Hutty, Kinney, Kloss, Kuniyoshi, Loggie, Margulies, McNulty, Nordfeldt, Ostrowsky, Partridge, Reynard, Ryder, Schaldach, Sloan, Smith, Sternberg, Sterner, Tittle, Tuttle, Vargish, Walkowitz, Washburn, S. M. Weber, Wickley, K. S. Williams, Woiceske, C. H. Woodbury, M. Young and C. J. Young, and A. C. Webb, Webster, and Orr (the three last named living in Paris). The veterans Benson, Marin, Wood, and Winkler, published nothing during the past year. Mexican graphic artists have devoted themselves largely to lithography, but Amero has etched some representative plates.

Tradition is strong in Great Britain, and etching there has been less affected by the so-called "modern" influence than is the case on the Continent and in the United States. The great Scotch triumvirate of Cameron, Bone, and McBey are still outstanding, though the first named published nothing in 1937. Nor did the well known Brockhurst, Blampied, Rushbury, and Lumsden publish anything though Griggs, Briscoe, and Hardie brought out beautiful plates. Others active were Airy, Brammer, Buckton, Burridge, Cowern, Davis, Delleany, Drury, Fairclough, Fleming, Gross (identified with the French school), Holloway, Lack, Lindsay (an Australian), Nixon, Osborne, Pearsall, Smart, Spencer, Squirrel, Taylor, Thompson, Tod, and Wilson. The Royal Society of Painter-Etchers and Engravers, with an annual exhibition in London, is the principal English print organization. Barry and Taylor are representative Canadian etchers, where the Society of Canadian Painter-Etchers and Engravers has renewed its activity. (J. T. Ar.)

**Ethiopia**, an ancient East African empire, incorporated since 1936 by Italy as a part of Italian East Africa. The ruler is still, *de jure*, the emperor Haile Selassie; but the King of Italy has been recognized as emperor by the totalitarian States and some others (see ITALIAN EAST AFRICA), many having representatives in Rome accredited to the "King-Emperor." The Italian viceroy is the Duke of Aosta, who succeeded Marshal Graziani in Nov. 1937. Ethiopia remains nominally a member of the League of Nations.

Estimated area, 1,120,000 sq.mi.; the population was estimated by the Italians (1937) as 7,600,000. The capital is Addis Ababa.

A BRIDGE UNDER CONSTRUCTION on the road between Addis Ababa, capital of Ethiopia, and Asmara, capital of the Italian colony of Eritrea, in Italy's extensive African road-building program

The Abyssinians are Christians, belonging to the Coptic Church.

**History.**—Many Abyssinian notables submitted to the Italians on Jan. 10, 1937, and the armies under Ras Desta and Gabre Mariam were defeated on Jan. 25 and Feb. 23. Ras Desta and other Abyssinian leaders were executed. It is certain that hostilities were continuing up to November, when 5,000 Abyssinians were reported killed and Italian casualty lists were also published. The British chargé d'affaires left Addis Ababa on Jan. 15, and American consular representation terminated on March 31. In March, during a ceremony at Addis Ababa, bombs were thrown which severely wounded the viceroy, Marshal Graziani, and General Liotta. In consequence 2,000 arrests were made, many executions followed, and Italian workmen ran amok, fired huts, and massacred, it is said, some 6,000 inhabitants. Subsequently the viceroy ordered the expulsion of more than 200 Italians responsible for these reprisals.

**Trade and Communications.**—Exports of coffee and hides and skins, which in 1934 accounted for nine-tenths of the total exports, have come to an end owing to passive resistance of the natives. Miles of valuable coffee plantations and tracts of agricultural land have been left uncultivated for two years. The gold mines are being exploited, and the total production of Italian East Africa for 1937 was 917 pounds. A State undertaking, the East African Mining Company, with headquarters at Addis Ababa (Feb. 1937) is authorized to prospect for and work minerals, the State contributing £86,000 to £120,000 annually for three years. Germany is showing technical and financial interest in this undertaking, and there has been a German geological expedition.

The primitiveness of communications is the chief obstacle both to conquest and to exploitation. Traffic on the road from Asmara in Eritrea to Makale in Abyssinia is, according to one witness, still only possible at 6 mi. an hour. On Oct. 16, 1937 an "extraordinary" expenditure of about £32 millions was authorized by royal decree for roads in Africa; and some 125,000 workmen, of whom 75,000 are Italians, are employed on roads which are estimated to cost £16,100,000. Italian labour is on a two-year contract at wages of 33 to 55 lire a week. Wages continue to rise, and native labour demands proportionate pay. Roads to connect Addis Ababa, Harar, and Gondar with the Red sea are promised for 1939.

The cost of living, especially in the capital, is reported to be

prohibitive, in spite of efforts to control prices, which leave traders no margin of profit. The Branch of Mohammed Ali, an Indian firm of multiple shops, was closed down by order in March, 1937, but was subsequently allowed liquidation and sale to Italian interests. Trade with other countries than Italy has been practically strangled by numerous export and import restrictions, though on Dec. 30, a trade agreement (the details of which have not been divulged) was entered into with Japan, and, by a viceregal decree of Feb. 3, 1938, export of hides to foreign markets is to be encouraged and those exported to Italy restricted to a proportion of those sold elsewhere. Development of foreign trade is to be fostered for the sake of foreign currency and improvement of the trade balance.

**Banking and Finance.**—The Maria Teresa dollar has been supplanted by the paper lira. In Nov. 1937 the exchange rate was 10½ lire for one dollar, but dollars are practically unobtainable. The Bank of Ethiopia has been dissolved, the manager of the Bank of Italy in Addis Ababa acting as liquidator. A claim was made for securities held for the Bank of Ethiopia by the Bank of Egypt. (See also ARMIES OF THE WORLD; COPTIC CHURCH.)

**Eucharistic Congress, 33rd:** see PHILIPPINES, COMMONWEALTH OF THE: *History*; ROMAN CATHOLIC CHURCH: *Eucharistic Congress*.

**Europe.** The year 1936 was marked by a succession of grave events which threatened more than once to bring Europe to the verge of war: the re-occupation of the Rhineland by Germany in defiance of the Versailles and Locarno Treaties; the Italian conquest of Abyssinia and the collapse of the League of Nations' policy of sanctions; the outbreak of the Spanish civil war; and the formation of two opposing groups of which the Franco-Soviet Pact and the "Rome-Berlin axis" were the nuclei. The year 1937 in Europe was free from any dramatic crisis. The Spanish civil war dragged on inconclusively. But though no decisive improvement can be said to have occurred in relations between the leading European Powers, and though rearmament everywhere proceeded at a feverish rate, tension relaxed somewhat towards the end of the year. Several causes contributed to this relaxation. It became more apparent during 1937 that none of the great Powers, however ambitious and dissatisfied, was disposed for the present to go to the length of provoking a European war; the war in the Far East diverted attention to another and more urgent danger-spot; and Great Britain, by sending Viscount Halifax on a semi-official mission to Berlin in November, showed that she was still bent on a policy described by the British prime minister as "a general settlement of the grievances of the world without war."

**The Spanish Civil War.**—In the Spanish civil war, the insurgents improved their position by the conquest of the Basque districts in the north, and now hold some two-thirds of Spanish territory. But they have failed to dislodge the Government forces from Madrid or from the eastern provinces. In spite of the agreement which has been in force since Feb. 20, 1937, prohibiting the sending of foreign "volunteers" to Spain, both sides continue to enjoy substantial foreign aid in men and material, Italy having officially admitted the presence of 40,000 Italian troops with the insurgent forces. Meanwhile, the Non-Intervention Committee met at frequent intervals in London. In August, the British Government laid before it a scheme for providing for the withdrawal of foreign volunteers and the granting of belligerent rights to the insurgents. This scheme was still under discussion at the end of the year. (See SPAIN, CIVIL WAR IN.)

**The Mediterranean.**—Anglo-Italian relations, already seriously damaged by British leadership in the application of sanctions

and by Italy's bid for supremacy in the Mediterranean, further deteriorated in 1937. A "gentlemen's agreement" between Great Britain and Italy, signed on Jan. 2, by which both parties reaffirmed their intention to respect the *status quo* in the Mediterranean, did not remove British and French suspicion of possible territorial ambitions of Signor Mussolini in the western Mediterranean; and anti-British broadcasts in Arabic from Italian radio-stations were a serious annoyance to the British authorities in the Near East. In July and August, numerous attacks were made in the Mediterranean on neutral shipping by unknown submarines which were not unnaturally assumed to be Italian. The British and French Governments, in an agreement signed at Nyon on Sept. 10, decided to establish a naval patrol in the Mediterranean in which Italy was invited to join. From this moment, the submarine attacks ceased. (See MEDITERRANEAN, THE.)

**Germany and Italy.**—The close association between Germany and Italy was frequently emphasized by both sides during the year, notably on the occasion of Signor Mussolini's visit to Germany in September. In November, Italy acceded to the "Anti-Comintern Pact" concluded between Germany and Japan in the preceding year, and shortly afterwards gave notice of her withdrawal from the League of Nations. In Germany, intensive rearmament was mainly responsible for a decline in the standard of living; and it may well have been this decline which prompted Herr Hitler to raise once more, with repeated insistence, the German claim to the return of her former colonies.

**France.**—In France there were also signs of the financial strain of rearmament. In June, the Socialist Government of M. Blum was replaced by the Coalition Radical-Socialist Government of M. Chautemps, and a program of financial reconstruction launched, which involved a further devaluation of the franc and modifications in the 40-hour working week introduced by M. Blum.

**U.S.S.R.**—In the Soviet Union, the second five-year plan was brought to a successful conclusion, and the first elections under the new constitution were held on Dec. 12. These proved to be something of a farce. Only one candidate was nominated in each constituency, and received the votes of from 90 to 95% of the electorate. Meanwhile, the campaign against "Trotskyists" and "saboteurs" led to thousands of executions, and tens of thousands of arrests. In June, Marshal Tukhachevsky and seven other leading generals were executed on the charge of conspiring with Germany. These events have weakened the position of the Soviet Union as a European Power, and caused serious misgivings in France as to the value of the Franco-Soviet Pact. One result of them has been to make French foreign policy more exclusively dependent on Great Britain.

**Great Britain.**—In Great Britain, which in May celebrated the coronation of King George VI, the feature of the year was the immense rearmament program. In his speech to the assembly of the League of Nations in September, Mr. Eden stated that the aggregate tonnage of the principal types of warships then under construction for the British navy exceeded 450,000 tons, that the expansion and re-equipment of the air force were proceeding rapidly, and that there was a continuous growth in the production of armaments for all three fighting services.

**The Smaller Powers.**—The smaller European Powers, unable to compete effectively in the armament race and deprived of any hope in the protective virtue of "collective security," have pursued, almost without exception, a policy of cautious neutrality. In central Europe, Czechoslovakia alone relies on her alliances with France and the Soviet Union; and the grievances of her large German minority are the pretext, rather than the cause, of her bad relations with Germany. This policy finds little favour with Czechoslovakia's partners in the Little Entente, Yugoslavia and Rumania. Yugoslavia has been on terms of friendship with Ger-

YVON DELBOS, minister for foreign affairs in Bium cabinet

many since 1934. In 1937 she reached an understanding with Italy, who granted her commercial advantages and undertook to bring to an end Italian propaganda against Yugoslavia. In Rumania a government of Fascist and anti-Semitic tendencies came into power at the end of the year, and this change was expected to reflect itself in Rumanian foreign policy. Economically, Germany has maintained and strengthened her strong position in most of the countries of central and south-eastern Europe.

In several European countries the economic situation has improved somewhat during the year, in part owing to expenditure on rearmament, and there has been a slight increase in the volume of international trade. At the end of the year, hopes of lowering economic barriers centred mainly on the forthcoming trade negotiations between Great Britain and the United States which, if successful, are expected to have favourable repercussions in Europe. (See also the various countries of Europe under their names; SOCIALISM.) (E. H. C.)

**European Literature.** **Austria.**—Among the historical works of 1937 in Austria were Dr. Schuschnigg's *Dreimal Österreich*, and the first volume of Hugo Hautsch's *Geschichte Österreichs*. Biography included Victor Bibl's *Kaiser Franz, der letzte römisch-deutsche Kaiser*, and the biography of an orchestra in von Kralik's *Die Wiener Philharmoniker*. There were several volumes of essays, especially some by Stefan Zweig, namely, *Begegnungen mit Menschen, Städten, Büchern*, and others entitled *Nähe und Ferne*, by Lothar.

The following novels were outstanding: von Hammerstein's *Der Wald*, Jelusich's *Die Ritter*, Lucka's *Der Impresario*, the third volume of Musil's *Der Mann ohne Eigenschaften*, Rende's *Der Glasbläser*, and Werfel's *Höret die Stimme*.

**Hungary.**—Perhaps most significant was the continuation of the sociographic movement originated by Illyés. The Athenaeum organized a sociographic series, "Discovery of Hungary," of which two volumes have appeared (Féja's *Viharsarok*, which was banned, and Erdei's *Futóhomok*), and two others are announced.

**Switzerland.**—In French, C. F. Ramuz's very successful *Der borence*, which deals with a legend in the *Alpes vaudoises*, and his latest book, *Si le soleil ne revenait pas*, a novel about a Swiss valley with only a few hours of sunshine during the day, are of value. Guy de Pourtalès wrote an interesting book in *La pêche miraculeuse*, and G. Oltramare's *Don Juan ou la solitude* must be remembered. M. Sandoz's poems, *Souvenirs fantastiques et Nouveaux souvenirs* were important. René Morax's play, *La servante d'Evölène*, a legend of the Valais, won great success. (S. L. EN.)

**Yugoslavia.**—In the Serbian language there were two important poetical publications: an anthology of post-war Serbo-Croatian verse, *Antologija srpsko-hrvatske posleratne lirike*, collected by Gavella, and Tin Ujević's collected poems, *Pesme*. The short stories of Ivo Andrić and Borivoje Jevtić were published in collected form. Village life was studied by Radić in *Selo* (Serbian life) and by Šubić in *Kaljuga* (Bosnian life). Two satirical comedies were produced by the old dramatist, B. Nušić. (X.)

**Romania.**—Poetry, which flourished in 1937, included Emil Bota's *Intunacatul April*, Tudor Arghezi's *Ce-ai cu mine vântule?*, Aron Cotrus's three volumes, *Horia*, *Tară*, and *Minierii*, and V. Voiculescu's *Urcus*. George Gregorian's poems, entitled *Lumini de seară*, won the poetry prize of the *Societatea Scriitorilor Români*. This society also awarded a prize to the novel by Dem. Teodorescu, entitled *Robul*, a violent satire of modern life. Alexandru Cantemireanu wrote an important novel dealing with the revolutionary period of 1848, in *Din vremea lui Căpitan Costache*. Mihail Sadoveanu, the popular novelist, produced *Cazul Eugeniei Costea* and *Povești vânătoarești*, a collection of hunting stories. In his novel *Mane, Tekel, Fares*, Cezar Petrescu began a trilogy

dealing with the peasant revolution of 1907.

**Bulgaria.**—Two volumes of poetry, Cyril Christov's *Water-break*, and Blenica's *The White Bird*, should be mentioned. History and archaeology were enriched by V. Myacotin's *History of Russia from the IXth to the XVIIIth century*. Among important novels, the following may be selected: K. Stoyanov's *Maria Magdalena*, V. Polyanov's *A Prince without a Crown*, G. Kaychev's *The Gentleman with the Girl*, C. Petcanov's *He comes from the Plain*, O. Vassilev's *Heroes do not feed their Mothers*, and F. Popova-Montafova's *The Daughter of Caloyan*. (S. L. EN.)

**Czechoslovakia.**—In lyrical poetry, O. Fischer's *Guest*, V. Nezval's *Absolute Sexton*, and Jan Zahradníček's *Greetings to the Sun* were outstanding. I. Olbracht wrote stories on Jews in Carpathian Russia *Golet in the Valley*, Karel Čapek published a novel on miners *The First Shift*, and J. Durych a new historical romance *Carnival*. M. Pujmanová's novel on post-war Czechoslovakia *People at Crossroads*, E. Hostovský's picture of Jewish family life *The House without Master*, and V. Neff's story from the Prague bourgeoisie *Two at a table* attracted much attention. Among plays K. Čapek's parable on dictators *The White Plague* is easily first. Zd. Nededly published the fifth volume of his monumental *Life of Masaryk*. (See also BELGIAN, DUTCH, ENGLISH, FRENCH, GERMAN, ITALIAN, RUSSIAN, SCANDINAVIAN, and SPANISH AND PORTUGUESE LITERATURES.) (R. WK.)

**Events of the Year:** see CALENDAR OF EVENTS, 1937, pages 1-14.

**Excess Profits Tax.** The excess profits tax, which is levied and collected in the United States at this time, must be sharply distinguished from the tax which people usually have in mind when they use this name. One commonly thinks of the excess profits tax as the tax measure which existed under that name from 1917 to 1921. That was the tax which was levied on the unusual profit which the war in Europe brought to American industry. It was levied on the excess of a reasonable return upon the invested capital of the enterprise involved.

The 1937 tax is imposed as a punishment for those corporations who undervalue their capital stock in reporting it for purposes of determining their liability under the capital stock tax. To give effect to this discouragement Congress imposed an excess profits tax at the rate of 5% to which corporations are liable on any income above 12½% of the declared value of their capital stock.

Under this tax the corporation which places the very low value upon its stock, will pay a corresponding low capital stock tax, but if it has large earnings, it will make itself liable to a considerable excess profits tax by reason of the low capital stock valuation. The collections under the tax are very small amounts and probably will continue to remain so. (See also INCOME TAX; TAXATION.) (D. F.)

**Exchange Equalization Funds.** The American Exchange Stabilization Fund, set up in 1934, was provided solely with gold, out of the profits arising from the devaluation of the dollar. Until the end of 1936 it could only sell gold, and had no dollars to sell. Thus it could only operate one way. This made it ineffective, for funds were then flowing into the United States, and so it was only being asked to buy gold and sell dollars. The result was that all gold coming into the United States passed into the banking system, and enlarged the credit base. In Dec. 1936, the American administration took power to borrow in order to supply the Stabilization Fund with dollars. This put it in the same position as the English Exchange Account.

FOREIGN MINISTER GALEAZZO CIANO of Italy (centre) shown with CHANCELLOR KURT SCHUSCHNIGG of Austria (right) and DR. GUIDO SCHMIDT of the Foreign Office

**Great Britain.**—The British Exchange Equalization Account was founded in 1932. It originally amounted to £175,000,000, but was enlarged to £375,000,000 in 1933 and to £575,000,000 in 1937. It is owned by the Government, but operated by the Bank of England, the general lines of policy being laid down by the Government. Its function is to offset sudden and wide fluctuations in the foreign exchanges, more particularly those due to capital movements. It is not intended to counteract long-term or permanent-exchange movements, such as are caused by a persistent lack of balance between imports and exports of goods and services.

It operates by buying and selling sterling in the foreign exchange market, usually without warning. As its resources are very large, the knowledge that it may intervene has proved a strong deterrent against speculation in sterling. Usually, any foreign currencies it acquires are at once turned into gold. It deals mainly in dollars and francs against sterling and in practice operates so that in case of need it can support the franc or dollar, as well as the pound itself.

To be able to buy and sell at will, it must always hold part of its resources in gold (which can be turned into foreign currencies at will) and part in sterling. On its foundation and subsequent enlargement, there was no difficulty in supplying the Account with sterling, for the Government simply issued cash out of the exchequer. Moreover, the Exchange Equalization Account does not hold its sterling in the form of cash. Instead it re-lends it to the Government, thereby reducing the need of the Government to borrow elsewhere. On the other hand, as the Account buys gold, it has to get its sterling back from the Government in order to pay for the gold. In order to find that sterling the Government has to borrow elsewhere.

It follows that for every £1 of gold held by the Exchange Account, the Government has to borrow £1 from the money market or the general investor. In practice, the Exchange Account's gold purchases are financed by issues of Treasury bills by tender to the banks and the money market. The statutory size of the Account simply determines the limit on the amount of gold it can hold.

This system leads to a paradoxical result. Under the gold standard, an influx of gold into the Bank of England, occasioned by an influx of foreign money, enlarges the credit base and makes money easier. But if the gold goes into the Exchange Equalization Account, the credit base is not enlarged. On the contrary, the Government has to borrow from the banking system in order to pay for the gold. This creates a new demand for credit, and so money becomes tighter. The remedy is for the Exchange Account to sell gold to the Bank of England, as any gold so transferred goes to enlarge the credit base. Gold was so transferred in early 1933, and the summer of 1936. The transfer of £65,000,000 in Dec. 1936 was because the Account was full of gold nearly up to its limit. To prevent it from enlarging the credit base, the fiduciary note issue was simultaneously reduced by £60,000,000.

The Exchange Account, of course, buys gold at the current market price of about 140s. per fine ounce. In effect, it re-sells to the Bank of England at the statutory price of 84s. 11d. per ounce, and has to bear the resulting loss. On June 30, 1937, it held £186,700,000 of gold, valued at 140s. per ounce.

**Netherlands.**—The Dutch Exchange Fund, set up in Oct. 1936, resembles the English account in its constitution and method of operation. The French Fund, like the American Fund, was constituted in Oct. 1936 out of the profits of the devaluation of the franc. It too could only sell gold, but such was the outflow of funds from France during the subsequent year, that it had to sell all the gold it had and then draw on the Banque de France.

Under the Tripartite agreement of Sept. 1936, there is close

co-operation between the various exchange funds. It is often impossible to tell which fund is operating in any market at a particular moment. (See also GOLD RESERVES AND GOLD STANDARD; EXCHANGE RATES.) (N. E. C.)

**Exchange Rates.** To understand the course of the foreign exchanges during 1937, it is essential to recall the background. England had abandoned the gold standard in 1931, and the United States had devalued the dollar to 59.06% of its former gold content in 1934. The chief gold bloc countries (France, Holland, Switzerland, and Belgium) had held on to the gold standard until Sept. 1936, although Belgium had had to devalue her currency in April 1935. At the end of Sept. 1936, France and Switzerland devalued their currencies and Holland abandoned the gold standard. Belgium adhered to the gold standard at the April 1935 parity, but other countries, such as Italy and Czechoslovakia, joined in the move. Simultaneously the Tripartite Monetary Agreement was signed by England, France, and the United States, and subsequently adhered to by a number of other countries. Under this, the signatories bound themselves to co-operate in the maintenance, as far as possible, of exchange stability, and to refrain from competitive currency depreciation. The Exchange Funds of the various countries were to work together for these purposes. (See also GOLD RESERVES AND GOLD STANDARD.)

The following table, giving the sterling value of most of the currencies concerned, serves to bring the story up to the opening of 1937:

Value of £1 in	Aug. 1931	Jan. 1936	Dec. 1936
Dollars . . . . .	4.86 $\frac{3}{32}$	4.93	4.90 $\frac{5}{16}$
French francs . . . .	124	74 $\frac{1}{16}$	105 $\frac{1}{8}$
Guilders . . . . .	12.05 $\frac{3}{4}$	7.25 $\frac{1}{2}$	8.96 $\frac{1}{4}$
Belgas . . . . .	34.85 $\frac{1}{4}$	29.25	29.13
Swiss francs . . . .	24.97 $\frac{1}{2}$	15.15 $\frac{1}{2}$	21.37

During the first two-thirds of 1937 the main question was whether France could hold her devalued franc in face of the rising trend of her internal prices and costs and the continued flight of capital abroad.

Up to a point, other countries were ready to help, as witness the £40 millions loan made by British bankers to the French railways at the beginning of 1937. Still, the position was complicated at home by the declared social policy of M. Blum's Government, and abroad by the sharp spring rise in commodity and security prices, followed by the catastrophic break, which began in April 1937, and persisted up to the end of November. The course of events was further complicated by the "gold scare" of the early summer, by the French change of Government at mid-summer, and by the "dollar scare" of November.

The important point to realize is that throughout the whole year the main influence upon the exchanges was movements of capital. Current trade, including both imports and exports of goods and also payments for services, played a comparatively minor part. Also, during the year exchange movements were frequently minimized by Exchange Fund operations, and in place of continual fluctuations there were increases and decreases in the gold holdings of the various Exchange Funds. On the other hand, when exchange movements did at last occur, they were inclined to be sudden and wide. The reader is referred to the main table, which illustrates some of these movements.

The first such movement was in April. By then the gold scare was at its height. There was a general belief that the dollar price of gold was about to be reduced. The London price of gold fell to a discount below the American shipping price, and the British Exchange Fund had to buy gold to support the market. By then the

pressure on the franc was severe, and the French authorities took advantage of the general disturbance to allow the franc to slide from frs.106<sup>3</sup>/<sub>8</sub> to frs.111 to the pound.

This new rate for the franc was held until the end of June when M. Blum's Government fell and was replaced by M. Chautemp's Government. One of the first acts of the new Government was to effect a new devaluation of the franc. The 1926 devaluation had reduced the gold content of the franc from 65<sup>1</sup>/<sub>2</sub> to 49 milligrammes of gold, and the franc was now devalued to 43 milligrammes. In consequence, sterling rose from frs.111 to just over frs.130 to the pound. Meanwhile, the summer break in Wall street had caused the pound to rise against the dollar from \$4.89 to \$4.98.

The pressure on the franc prior to this devaluation had also created certain problems for the British authorities. In order to help both the franc and the London bullion market, the British Exchange Equalization Account had had to make heavy purchases of gold. By the end of June the capacity of the Account to buy gold was near exhaustion, and so an Act was passed enlarging the Account by £200 millions sterling.

During August quieter conditions prevailed, and the new French Government tried to set the French finances in order. Unfortunately, the flight of capital from France continued, and in Sep-

tember a fresh break occurred, which at one time carried the pound to just over frs.150. Fortunately, this was the turning-point. Serious weakness had by then developed in the London and New York stock markets, while the impression gained ground that the new French Government was proving successful in its financial efforts. Thus capital at last began to return to France, and the movements were accelerated in November by a rumour that the American Government was contemplating an increase in the dollar price of gold in order to arrest the American autumn business recession. Sterling fell to frs.147, and the French Exchange Fund was able to recover a substantial part of its previous gold losses. Simultaneously sterling rose to \$5.02. By the end of November this particular scare had subsided, and sterling came back to \$4.99; but France held most of her regained gold. Indeed, the French position was further strengthened during the autumn, for loans from Switzerland and Holland to the French railways, together with the French gold recoveries, enabled the French railways to repay the sterling credit granted to them at the beginning of the year.

The whole history of 1937 is thus one of sudden capital movements, inspired partly by fear and rumour, and partly by the radical change in conditions on the London and New York stock mar-

kets—particularly New York, where the autumn collapse was more serious. Underlying this was the deterioration in French finances up to midsummer, followed by the autumn recovery. Commercial influences had little effect upon the exchanges. (See also EXCHANGE EQUALIZATION FUNDS.) (N. E. C.)

**Exchange Stabilization Fund:** see EXCHANGE EQUALIZATION FUNDS.

**Exhibitions and Fairs:** see FAIRS AND EXHIBITIONS.

**Exploration and Discovery.** Dr. G. Weidman Groff of Lingnan university, Canton, China, led a National Geographic Society expedition into the interior of Kwangsi Province, South China, to explore that little-known region. The expedition obtained the first specimens known to Western science of the Lohon plant, the fruit of which is highly prized by the Chinese for its medicinal qualities. In 1937 the National Geographic Society in co-operation with the United States Navy sent to Canton island, in the middle of the Pacific ocean, an expedition which made important studies of the sun during the longest total solar eclipse in over 1,200 years, that of June 8. Dr. William M. Mann led the National Geographic Society-Smithsonian Institution East Indies expedition in the Netherlands Indies and adjacent portions of south-eastern Asia. A cross-section of the fauna of the region was represented in the cargo of animals brought to the United States and presented to the National Zoological Park in Washington.

**Antarctic Exploration.**—The British Graham Land expedition, led by John Rymill, completed a stay of two and one-half years in the Antarctic. It reported that Graham Land, opposite South America, is not an island but a peninsula of the Antarctic continent. Alexander I Land, nearby, was found to be several times larger than previously reported. Rocks in Graham Land were found to be related to formations at the southern tip of the Andes. Lars Christensen of Norway led an expedition in 1936–37 to chart the little-known coast line in the Atlantic sector of the Antarctic continent between long. 45° E. and long. 20° W. Viggo Wideroe, aviator with the expedition, reported discovery of a range of mountains between the 35th and 40th degrees E. long. and about 70° S. lat. The "Discovery II," British exploration ship, completed a 20-months' study of Antarctic waters, laying emphasis on smaller forms of marine life and the distribution of whales. (See also ANTARCTICA; ANTARCTIC EXPLORATION.)

**American Exploration.**—Dr. H. E. Anthony, American Museum of Natural History, led a party which on September 16 climbed Shiva Temple, a 300-acre plateau in the Grand Canyon of Arizona, believed to have been isolated about 20,000 years by erosion since the glacial period. The expedition found that animals on the plateau had not developed differently from others in the region, despite this long apparent isolation. Mount Lucania, 17,500ft. high, in south-western Yukon Territory, North America's highest hitherto-unclimbed peak, was scaled July 9 by Bradford Washburn, Cambridge, Mass., and R. H. Bates, Philadelphia, Pa. An expedition of the Utah Museum Society, exploring the Kaiparowits plateau in southern Utah, found dinosaur tracks in a sandstone slab, ancient rock paintings in which the swastika is a prominent feature, and a mountain in which coal veins have been burning for centuries. Captain E. E. Loch, leader of the New York Museum of the American Indian Andes-Amazon expedition, reported rediscovery of Inca gold workings in the Llanganates range of the Andes mountains of Ecuador; finding that the legendary gold of Lake Valverde is only "gold" mica, or fool's gold; mapping previously unexplored territory; and locating a new trans-Ecuadorian air route.

**Arctic Exploration.**—Four Soviet Russian scientists estab-

lished a camp on an ice floe near the North Pole in May, to spend a year collecting meteorological data for the proposed air route between Russia and the United States. They were in constant touch with Moscow by radio. The camp and its ice floe drifted on a zigzag course toward north-east Greenland, at an average speed of more than 3½ miles per day. Three Russian flyers, Valeri Chkaloff, Georgi Baidukoff, and Alexander Beliakoff, on June 20, completed the first flight over the North Pole between Moscow and the United States. They landed in Vancouver, Wash. A world record non-stop and non-refuelling aeroplane flight of 6,262mi. was established July 14 by three Russians, Mikhail Gromoff, Andrei Yumosheff, and Sergei Danilin, when they landed near San Jacinto, Calif., after taking off from Moscow 62 hours before, and passing over the North Pole. A third party of six Russian flyers, led by Sigismund Levanevsky, flew from Moscow over the same route August 12, but were forced down between the North Pole and Alaska and never found. (See also ARCTIC EXPLORATION.) (G. GR.)

**Exports and Imports.** As in many other spheres of activity, 1937 may prove to be a turning-point in the field of international trade. The depression of 1929–33 brought international trade almost to a standstill. Some countries found that the prices of their staple exports had fallen to zero, and that huge stocks of their chief products were accumulating, unsaleable in the world's markets. Other countries were faced with external debts which could not be met, and with a consequent breakdown of the whole mechanism of foreign exchange. Most countries rushed to heighten tariffs and impose import quotas and exchange restrictions in an attempt to take shelter as far as possible from the blast of the depression; and so far as international trade was concerned, these measures simply aggravated the depression.

The years 1933 onwards to 1937 were a period of gradual recovery. Prices rose, surplus stocks were liquidated, production in some cases was regulated by international agreement, and some countries were able to compound with their foreign creditors and relax their exchange restrictions. Currency devaluation also helped to restore equilibrium to international trade. As a result, imports and exports expanded over most of the world. Many countries, however, retained some measure of exchange control, either as an essential part of their new social and economic system of internal government, or because they felt bound to make imports conform in value to their exports. Furthermore, the system of bilateral exchange clearing or payments agreements between pairs of countries persisted, for political as well as economic reasons.

While some of these agreements in themselves worked reasonably well, their net effect was that international trade to some extent remained canalized, and was denied an opportunity for full and free recovery.

**The United States.**—The following table shows the United States trade returns for recent years:

Monthly Average	Retained Imports (\$ millions)	Domestic Exports (\$ millions)	Surplus of Exports (+) or Imports (–) (\$ millions)
1929 . . . . .	362	430	+68
1932 . . . . .	110	131	+21
1933 . . . . .	119	137	+18
1934 . . . . .	136	175	+39
1935 . . . . .	170	187	+17
1936 . . . . .	202	201	— 1
1937 (9 months) .	265	260	— 5

The most important development, amid the fall and recovery of the past eight years, is that the United States' export surplus has turned into an import surplus. Thus her trade balance has at last conformed to the typical balance of a creditor nation, in which payments due from her debtors are received in the form of an import surplus. In spite of the business recession of late 1937, both imports and exports ran well ahead of those of 1936. Here again, it will be of interest to see if there is any falling-off in 1938.

In 1935 and again in 1936, the United States had an adverse balance of payments (\$153,000,000 in 1935 and \$333,000,000 in 1936). Silver purchases, immigrants' remittances to their home countries, and American tourists' expenditure abroad far outweighed interest and dividends on America's foreign investments. Nor is there any reason to believe that 1937 will show a different result. The truth is, that the United States' huge gold acquisitions of recent years were entirely due to the big influx of foreign capital into the United States.

The French repatriation of Nov. 1937 led to an immediate outflow of gold from the United States, which again shows how gold and capital movements are linked together.

**The United Kingdom.**—The trade returns for recent years are summarized below:

Monthly Average	Retained Imports (£ millions)	Exports of British Goods (£ millions)	Import Surplus (£ millions)
1929 . . . . .	92.6	60.8	31.8
1932 . . . . .	54.2	30.4	23.8
1933 . . . . .	52.2	30.7	21.5
1934 . . . . .	56.7	33.0	23.7
1935 . . . . .	58.5	35.5	23.0
1936 . . . . .	65.7	36.7	29.0
1937 (9 months) .	79.5	43.5	36.0

The drop between 1929 and 1932 is very noticeable, even though it was largely but not entirely due to the fall in prices. Since 1933, there has been a progressive recovery, culminating in the 1937 returns, which show imports nearly back to the 1929 level.

Exports have improved as well, but the increase is less marked. The result is that the import surplus for 1937 was in excess of that even for 1929.

The growth in the import surplus, especially during the past two years, is due to a variety of causes. First, there is the rise in world prices up to early 1937. This was more pronounced in prices of food and raw materials, which Great Britain largely imports, than in prices of finished goods, which account for most of Great Britain's exports. Next, there was the big recovery in British internal industry and commerce. More raw materials were needed by British manufacturers, and the home demand for their products was such that in some cases export orders were either turned down or not actively sought. British rearmament increased this tendency, particularly in the heavy industries. Apart from these purely British factors, there were the new factors abroad of Japanese competition (up to mid-1937) and German trade based on exchange clearing or compensation agreements. Probably these were of much lesser importance than the influences previously mentioned.

So far this growth in Great Britain's import surplus has not been a serious matter from the foreign exchange point of view, though all the evidence at the end of 1937 suggested that the year's balance of payments would show a fairly large deficit. Much of Great Britain's trade is either with the empire or the sterling area countries, and to that extent a trade deficit does not automatically throw a strain upon the pound or upon the British gold reserves. The rearmament demand for raw materials is

likely to continue, but the autumn's fall in prices may next year reduce the cost of raw material imports. It is, however, equally likely to affect the purchasing power of many of Great Britain's overseas customers.

**France.**—The French trade returns of recent years are similarly summarized below:

Monthly Average	Imports	Exports (Fr. millions)	Import Surplus
1929 . . . . .	4,852	4,178	674
1932 . . . . .	2,484	1,642	842
1933 . . . . .	2,369	1,539	830
1934 . . . . .	1,925	1,487	438
1935 . . . . .	1,745	1,289	456
1936 . . . . .	2,117	1,288	829
1937 (11 months)	3,148	1,799	1,347

The adherence of France to the 1938 gold parity of the franc, which lasted up to Sept. 1936, forced on her a policy of continued deflation, which seriously affected her trade. This explains the continued drop in both imports and exports up to and including the year 1935. In Sept. 1936, came the first devaluation of the franc. This caused an immediate and proportionate increase in the cost of most French imports, and this is reflected in the 1936 increase in the value of imports. Exports, however, did not respond at once, partly because French trade was slow in reviving and partly because, unlike imports, the average price of exports is determined by internal conditions rather than the value of the franc in foreign currencies. Nineteen thirty-seven has witnessed a big increase on both sides. Imports have risen the most in value, due to the 1937 devaluation and depreciation of the franc, and also to the revival in French industry and French rearmament needs.

The increase in exports is also substantial, and can be ascribed both to the rising trend of French production costs and to the year's recovery in French trade.

The bigger increase in imports has raised the import surplus to twice its 1929 level. Any such comparison is, of course, confused by the intervening fluctuation in the franc and other currencies, but there is no doubt that last year France had a big adverse trade balance. So far this has been a much less potent cause of the weakness of the franc than the flight of French capital abroad; and if French capital returns, the franc will improve, in spite of a large adverse trade balance.

Still, in the long run, the 1937 adverse trade balance is probably bigger than France can tolerate.

**Germany.**—The trade returns for recent years are as below:

Monthly Average	Retained Imports (Rm. millions)	Domestic Exports (Rm. millions)	Surplus of Exports (+) or Imports (−) (Rm. millions)
1929 . . . . .	1,120	1,124	+ 4
1932 . . . . .	389	478	+89
1933 . . . . .	350	406	+56
1934 . . . . .	371	347	−24
1935 . . . . .	347	356	+ 9
1936 . . . . .	352	397	+45
1937 (10 months)	445	476	+31

To interpret the trend of the returns, it is first necessary to remember that imports are regulated in such a way as to ensure an export surplus. The valuation of both imports and exports must also be qualified to some extent by the fact that most of Germany's trade is conducted through exchange clearing and compensation agreements, embodying in many cases an agreed rate of exchange. The expansion in imports and exports since 1933, though considerable, falls short of the expansion in Germany's

internal activity. This explains the current German argument that her raw material imports now fall short of her needs. It also explains the complex system of import control, designed to meet such varying needs as the requirements of her export industries, rearmament, and the development work under the Four-Year Plan.

**Other Countries.**—The rest of the world followed the general trend of slump up to 1932 and recovery up to 1937. In most cases, foreign trade is governed by the demand for primary products, which form the staple exports of such countries as the British Dominions and the South American republics. The recovery in primary products from 1932 to 1937 increased first these countries' export trade and then their ability to import. Similarly, the setback in commodity prices during the last half of 1937 has already begun to affect certain South American countries, while the fall in wool must be affecting Australia after her previous good years. Still taking a general view, world trade was, at the end of 1937, much better than in 1932. (N. E. C.)

**Fabrics:** see FASHION AND DRESS: *Fabrics*.

**Factories Act:** see LABOUR LEGISLATION: *Great Britain*.

**Fairs and Exhibitions.** In the bazaars of the East and the fairs and markets of the middle ages, goods were collected, displayed and sold to the buyer. The modern plan is to exhibit samples of the season's offerings at commercial reunions and thus stimulate general trade. Orders may be taken but they are fulfilled elsewhere.

Many of the "shows" are held annually and they enable distributive agencies to see the latest types and fashions in their fields of activity. Automobiles, aircraft, motorboats, machinery, accessories for home and office, foods, luxuries and books are in the shop window or booth and inspected.

The international and inter-industrial exhibition synchronizes many "shows" and covers all the developments of modern civilization. It continues as a rule during the pleasantest months of the year and associates manufactures, agriculture and the arts with amusements and municipal development. The first of these impressive fairs (1851) was held in Hyde Park, London, and the Crystal Palace that contained the exhibits, after removal to Sydenham, was burned (Nov. 30, 1936).

Many international exhibitions have celebrated anniversaries. In 1939, New York will thus observe the sesquicentennial of Washington's inauguration as first president of the United States on the steps of the Sub-Treasury in Wall street. The New York World's Fair, surveyed in prospect, appears to be the largest enterprise of the kind ever undertaken. It is preceded by civic improvements that are transforming much of New York city, including the Triborough bridge, the Bronx-Whitestone bridge across Long Island Sound, the Spuyten Duyvil bridge across the Harlem river, tunnels under the Hudson and East rivers and the Hudson river parkway parallel with Riverside drive which is a link in a clear route from Westchester county along Manhattan Island and into New Jersey. The site of the New York World's Fair is 1,216½ acres of reclaimed land known as Flushing Meadows. The plans include 10,000 trees, 25,000 hedge plants, 250,000 spring bulbs, 450,000 annuals and 250 acres of grass. Amusements continue for 2 miles of lake front and will accommodate 250,000 persons at any given time. The arrangements for catering embrace 43,200 seats in restaurants and 337 food stands. Numerous buildings are grouped around a "trylon" or triangular obelisk 700ft. high which serves as beacon and for broadcasting. A huge globe or "perisphere," 200ft. in diameter, and apparently supported by fountains, contains a revolving platform from which spectators can survey "the world of tomorrow."

The estimate of expenditure on this World's Fair has risen to \$150,000,000—roughly the cost of three battleships. This expenditure is met by the surpluses realized on the sale of concessions to exhibitors, caterers and the sideshows, and by receipts from the public. It is hoped that 50,000,000 persons will visit the fair in the first year and it can be reopened in 1940 if public interest continues. The indirect benefits of the World's Fair have also to be entered on the balance sheet. No fewer than 64 nations are participating, a remarkable expression of international goodwill, and when the Fair is brought to a conclusion New York will have acquired a permanent playground, 50% larger than Central Park (840 acres).

As the metropolis of the Pacific, San Francisco has recently displayed astonishing progress. The San Francisco-Oakland bridge cost \$77,000,000 and is the longest in the world. The Golden Gate bridge cost \$33,000,000 and is the longest span in the world. "Clippers of the Air" have added the spectacular to western aviation. In 1939, California is holding a Pageant of the Pacific to celebrate these great changes. The site is an area of 400 acres reclaimed from San Francisco bay as a WPA project and costing \$3,803,000. It has been named Treasure Island and it is destined ultimately to be an airport for which purpose certain buildings of the exposition will be adaptable. The cost of the Fair—estimated \$50,000,000—is met, actually and prospectively, by Federal and State grants, public subscriptions, concessions and expenditure by visitors. The architecture of the exposition—Mayan, Malayan and Cambodian is picturesque and characteristic. It will be enhanced by coloured flood light. A Temple of Music, a Theatre of the Sky and carnivals in the 40-acre "fun zone" are among the arranged attractions.

In 1938, Great Britain concentrates her energies on the Empire Exhibition to be held in Glasgow from May to October. It is the largest exhibition in Great Britain since Wembley in 1924–25 and is characterized by boldly modern architecture. The site of the exhibition is Bellahouston park covering 1,000 acres and there are 30 buildings one of which will include an elaborate relief map of Scotland with moving trains, ships, etc. The aim is definitely to present a vivid picture of what the Empire means in terms of life and commerce.

Mention should be made also of the Paris Exposition of 1937 with buildings costing \$10,000,000, at which 50 nations were represented, and of Japan's proposal to hold an exhibition at Tokyo in connection with the Olympic games (1940). (See also ARCHITECTURE: *Paris Exposition*.)

**Falkland Islands,** a group in the south Atlantic (see *Encyclopædia Britannica*, vol. 9, pp. 51–53); a British Crown colony since 1833, the claim of ownership by the Argentine Government not having been recognized by Great Britain or the League of Nations. Area, 4,600 sq.mi.; population (estimated 1935, including South Georgia), 3,180. The chief town is Stanley, in East Falkland (population, 1,200). South Georgia, the South Shetlands, South Orkneys, Graham's Land, and other British islands in the neighbourhood, are dependencies of the Falklands. Sheep-farming is the principal industry; and whaling is extensively engaged in. The 1935 revenue was £49,800 and the expenditure £59,800; exports were valued at £124,300, and imports at £100,800.

**Farmers' Co-operatives.** Ten leading countries of the world have 40,868 farmers' co-operative associations engaged in marketing farm products or buying farm supplies. France has 16,823, with 847,686 members. In the United States latest estimates by the Farm Credit Administration place the number at 10,500. Of those in the United States

8,388 marketing associations have 2,710,000 members and did an annual business of \$1,586,000,000; 2,112 purchasing associations had 950,000 members and annual business of \$254,000,000. In Canada the official directory lists 779 marketing and 514 purchasing associations. In both countries, however, some organizations perform both services. Latest available figures give 1,090 as the number of farm co-operatives in Great Britain, 150,016 members and annual business of \$54,119,154. Denmark, long outstanding, has 5,182 associations with 590,853 members and annual business of a quarter of a billion dollars in a farm population of about 2,000,000. In Canada and the United States there is approximately one co-operative member to every two farms. This does not mean every other farmer is a member, for often one farmer may belong to several associations. Switzerland has 6,136 associations with 362,927 members and \$21,324,324 annual business; Czechoslovakia, 5,376 with 597,079 members, and \$87,744,823 annual business; Finland, 1,562 with 366,134 members, and \$60,076,440; Sweden, 1,541, with 395,474 members, and \$54,412,800; Norway, 1,363 with 204,356 members, and \$36,683,466. Germany, Italy, and Russia are not included because they present no comparable figures of free, co-operative enterprises. In the United States there are 3,010 grain, 2,270 dairy, 1,063 fruit and vegetable, 1,040 live stock, 311 cotton, 154 poultry, 114 wool marketing associations. (S. O. R.)

**Farm Income.** For the fifth successive year farm income in the United States advanced in 1937. Estimates of the Department of Agriculture place the income for the twelve months at nearly \$9,000,000,000, approximately \$1,000,000,000 more than that of 1936 which was \$7,865,000,000. For farm products in 1937 farmers received, it is estimated, about \$8,575,000,000, which is almost double the amount received in 1932, the low year of the depression. In addition to the sale of products Government payments in 1937 amounted to \$330,000,000, which will probably have been increased to about \$400,000,000 to \$450,000,000 by deferred payments from the 1936 agricultural conservation program, which figures are not available. Similar Government payments made in 1936 added \$287,000,000 to the farm income of that year, which included \$7,578,000,000 from the marketing of farm products.

While the total farm income for 1937 was not as large in the amount of actual money received, as compared to the pre-depression years, the buying power is greater than that of the period beginning in 1924 and ending in 1928 because products the farmer buys were cheaper in 1937. The 1937 income bought almost as much as the peak-year income of 1929 when farmers received for their products alone \$10,479,000,000. Government payments did not begin until 1933. The index of prices paid by farmers in 1929 was 99. It declined to 69 in 1932 and had risen to 86 in 1937. This index is based on 1924-29 prices.

There are, however, more people on the farms now than during the pre-depression era, which partly offsets the higher buying power since there is a larger per capita division of income. The pre-depression years, on the other hand, were not a period of great prosperity to farmers because not only farm living costs were high, but interest rates were unusually burdensome because the price of farm lands had fallen steadily and many farms had been mortgaged at inflated land prices.

From the peak year of 1929 farm income from marketing declined to \$8,451,000,000 in 1930, to \$5,899,000,000 in 1931, and to the low of \$4,328,000,000 in 1932. In 1933 income from marketing increased to \$4,955,000,000. To this the Government added payments of \$162,000,000, raising the farm income for that year to \$5,117,000,000. In 1934 the money received for farm products equalled \$5,792,000,000. Government payments of

\$556,000,000 increased this to \$6,348,000,000. Farm marketing brought in a total of \$6,507,000,000 in 1935, and Government grants amounting to \$587,000,000 raised the year's income to \$7,094,000,000. In 1936, although the total was about \$1,000,000,000 under that of 1937 the index of prices paid by farmers was 81 as compared to 86 in 1937.

The drastic decline in commodity and security prices in the autumn of 1937 severely affected farm income. This was partly offset by the huge volume of products from bumper crops, especially of cotton, corn and fruits. Cotton sold at the lowest price in four years and wheat broke under a dollar. Tobacco, although a large yield in 1937, maintained good prices because of the constant increase in smoking. The rice crop was the largest in 28 years. Dairy and poultry prices continued good and the potato yield was 69,000,000 bushels more than 1936. (S. O. R.)

**Farming:** *see* AGRICULTURE.

**Farm Mortgages.** A total of \$44,715,769 in mortgages on 25,113 farms was paid in full during the year ending Sept. 1, 1937, W. I. Myers, governor of the United States Farm Credit Administration, reported. This exceeds by more than 60% similar payments in full in 1936. First mortgage loans on 11,925 farms, totalling \$26,402,611 were paid the Federal Land Banks, and loans on 13,188 farms, amounting to \$18,313,158, were paid to the Land Bank Commissioner. Land Bank Commissioner loans have been made since 1933, many of them on second mortgages to farmers facing foreclosure. At that time, the Government reduced interest rates on outstanding loans to 3½% until June 30, 1937, and 4% on new loans. During the year \$39,231,091 regular installments of principal were paid. This was 83.2% of the amount due, the Farm Credit Administration reported, and compares with 63.7% of regular, installment payments in 1936. Payments on Land Bank Commissioner loans in 1937 were more than double those of 1936.

The shift of farm indebtedness to Federal agencies continues and it is estimated that Government institutions now hold approximately 40% of the farm mortgages. In 1928 the life insurance companies held 22.9% and Federal Land Banks, 12.1%. By 1935 the life insurance company holdings had declined to 16.3, the commercial and savings bank holdings from 10.8 to 3.4% and the mortgage company holdings from 10.4 to 3.4%. Marking its fourth anniversary on April 27, 1937, the Federal Credit Administration reported it had lent \$4,367,000,000 to farmers, as follows: Federal Land Banks, \$1,259,000,000; Land Bank Commissioner, \$918,000,000; production credit associations, \$652,000,000; Federal Intermediate Credit Banks, \$614,300,000; Regional Agricultural Credit Corporations, \$413,000,000; emergency crop loans, \$149,000,000; emergency feed loans, \$72,000,000; 13 banks for co-operatives, \$232,000,000. The total farm mortgage debt is roughly estimated at \$7,500,000,000. It was \$3,320,000,000 in 1910, \$7,857,000,000 in 1920, \$9,460,000,000 in 1929, the peak year. Since then it has declined. The 1937 estimate cannot be exact because of foreclosures and compositions still in process, and Government authorities, therefore, give no precise figure. (S. O. R.)

**Farm Tenancy Act:** *see* UNITED STATES: Congress.

**Farouk I** (1920— ), king of Egypt, only son and eldest child of King Fuad I; born at Cairo on Feb. 11, 1920; succeeded his father on April 30, 1936. In 1935, as H.R.H. Prince Said, he was sent to England to complete his studies. He represented his country at the funeral of King George V; but his father's death prevented his proceeding to the Royal Military

AS WALLACE SEES IT." The economic see-saw between fat and lean years, as Siegel pictures in *The Richmond Times-Dispatch*, the U.S. Government plans for an Ever Normal Granary

Academy, Woolwich, and he returned to Egypt, a regency council electing for him until his coming of age on July 29, 1937.

On that same day, he was invested as king in the parliament building, Cairo.

On Aug. 22, 1937, the king's engagement to Mlle. Sasi Naz Mifcar, daughter of a judge of the Alexandria Mixed Appeal Court and granddaughter of a former prime minister, was announced, the wedding later being fixed for Jan. 20, 1938. Later in the year a constitutional crisis arose, partly through the king, against the advice of Nahas Pasha, reappointing (Oct. 20) Aly Maher Pasha to his former office of chief of the royal cabinet, and partly owing to a disagreement between the king and his prime minister over the interpretation of the constitution with reference, especially, to the appointment and dismissal of ministers. Before the end of the year the crisis had come to a head, and on Dec. 30, Nahas Pasha was dismissed and a new cabinet appointed (see EGYPT: History).

**Fascism.** Fascism is a term derived from the Latin *fascēs*—the bundle of birch rods, bound together by a red thong and containing an axe in the middle, which was carried by victors before the higher Roman magistrates as a symbol of executive authority. In its modern Italian usage, by a natural extension, the term *fasci* signifies groups or bodies of men combined in a political organization. Since 1919 the term fascism has been particularly and specifically applied to the principles and organization of an Italian nationalist political party, founded and led by Signor Mussolini, which in Oct. 1922 assumed control of the government of Italy under the style of the *partito nazionale fascista*. By an easy transference the term has also come to be applied to the principles and organization of similar parties in other countries. In its widest sense it thus designates any body

of belief, backed by a party, which insists on national unity and executive authority, most particularly in opposition to Communist principles and propaganda. In this sense it may include the national Socialism of modern Germany; but German national socialism has its own peculiar features (for example, its cult of racial unity and its special emphasis on the principle of leadership), and in spite of its analogies with Fascism, it may be classed as *sui generis*.

The principles of Italian Fascism, which may be taken as the type, begin in a strong sense of the need and the value of executive authority, and therefore in opposition to parliamentary democracy, with its supposed exaggeration of the authority of the legislature (and thus of the multiple parties which fill the legislature) at the expense of the executive. The source of a single and powerful executive authority is sought in a single party, which permits no other parties. The single-party system, as it may be called, is thus an essential element of Fascism. The inspiration of this single party is found in a deep conviction of the prior and supreme value of national unity, overriding party divisions, overriding the struggle of classes, overriding local particularism. The Italian Charter of Labour of 1927 (one of the great documents of the régime) accordingly asserts that the Italian nation is a higher organism, superior to all individuals and groups, which is integrally realized in the Fascist State—that is to say, in the government of the Italian State by the Fascist party. On this basis, Fascism becomes "totalitarian": in other words, it seeks to control the whole of the body politic, and the whole of its range of life—education, the use of leisure, production, and every activity—by the one principle of national unity and national power. On the other hand, and for the last dozen years, since the principle was first enunciated in 1926, Fascism is also "corporative" and seeks to institute the corporative State. It believes that masters and men, in each branch of production, should be organized in a joint corporation or guild, and should regulate, through that guild, their mutual relations and their common effort of production. Meanwhile, in the field of external relations, Fascism has steadily emphasized the principle of national power: it has promoted national expansion in Abyssinia; it has recently put much of the national industry on a war footing.

It has also asserted the idea of national self-determination by seceding from the League of Nations.

In its organization Fascism has been true to its principles. At its centre stands the Grand Council of the Fascist party, under the presidency of the Duce. The party itself includes about 2,000,000 regular members; and there is also a party militia of about 200,000. The head of the party is also the head of the government, or prime minister; his office is permanent, and his power ubiquitous. The Chamber of Deputies, under the law of 1928, is recruited from the Fascist party; but by its side, and apparently as its destined successor, there has stood for the last eight years a national council of corporations. It was not, however, until 1934 that actual "corporations" were instituted in the various branches of production; but since that year there have been 22 corporations at work. The "syndicates" (federations of employers and trade unions of workers) which join to form these corporations or guilds are bodies recognized and regulated by the Government; and all in all, in its organization, Fascist Italy is a highly unified national State, held together under the control of a single party, and bound together by a single and vigorous discipline.

(E. B.)

**Fashion and Dress.** It would have been strange if, in a year so marked by change throughout the world, fashions too had not shown a restless vacillation. For

modes and manners never fail to reflect the temper of the times. The two fundamentals of feminine dress are shape or silhouette, and skirt-lengths. So basic are these aspects of women's clothes that invariably, when they alter, they do so gradually. Usually it takes at least five years of careful development to change the underlying structure of clothes. Yet, when 1937 dawned, the woman of fashion throughout the world showed the exaggerated shape she had been content to assume for several years preceding; but as 1937 faded into history she stood silhouetted in a completely new outline—easy and natural.

The 1937 silhouette is tubular in form, and follows fairly faithfully the natural contours of the feminine figure, except that it indicates the waist at a point slightly lower than normal. The silhouette of previous years was almost hour-glass in form, marked by padded, exaggeratedly wide shoulders, and a small, high waist.

Not content with changing one dress fundamental, the silhouette, 1937 also toyed with the other, and tried to alter evening hemlines. Full-cut ankle-length evening dresses were proffered in February of 1937. Probably this was a natural outgrowth of the universal enthusiasm for ballet. For the few months succeeding the introduction of the ankle-length evening skirt, various other compromise suggestions, such as evening skirts that were short in front but long in the back, were made to persuade fashionable women away from the floor-length evening skirts they had been wearing for years. But the smart women, after a half-hearted attempt to follow the designers' lead, finally rejected any change from the even floor-length skirt she has so persistently preferred to wear by night.

To sum up, then, 1937 definitely achieved a change in silhouette. It tried and failed to alter evening skirts from long to short. But it is a significant fact that, for the first time in fashion history, a single year has seen the development of two such major moves. Does it mean that in a modern world, where nothing is permanent but change, fashions too will come and go, at an accelerated pace?

Let us now look at the minor manoeuvres of fashion in 1937. The following things stand out:

A SIGNIFICANT FASHION development of 1937, a Molyneux suit with lower waistline and more tubelike silhouette

**Furs** are no longer a question of seasons. For some years they have sought, and finally in 1937 secured, a place in the year-round wardrobe of the fashionable woman. A rising popularity for long-haired furs such as blue fox has brought about in 1937 a new type of fur coat, which is bulky, chunky, even almost clumsy, in appearance.

**Jewels.**—Persistently and patiently for several years, these have been growing imaginative and immense. Daintiness is a word that has fallen into disuse so far as jewellery is concerned. Intrinsic value is relatively unimportant. The great success of the year was a pair of clips made by Cartier, in gold, enamel, and diamonds, to represent two blackamoors' heads. These were swiftly copied at popular prices, and swept the fashionable world, to die an early and inevitable death.

**Fabrics.**—A trend that has, for some time, been growing and finally, in 1937, has achieved the status of an accepted fact is that wool fabrics are now worn for evening. No longer does the convention of wool for day only, silk for evening, hold good, though silks remain overwhelmingly the preference for formal frocks. One specific fabric alone stood out as a major success in the 1937 fashion review. This was silk jersey. Launched four years ago it was not until the autumn of 1937 that it was universally worn.

**Colours** do not change. In spite of fashion propaganda, all smart women the world over prefer black. Autumn always ushers in browns, greens, and wine colours with only subtle variations in shade from year to year. Spring always means navy blue, no matter what fine differences of tone from season to season. White followed by pastels is always, saving black, the preference for evening. So in 1937, there was no dramatic change in fashionable colours. Only one new colour arrived; it was "Shocking Pink," introduced by Schiaparelli in Feb. 1937, then taken up by other designers, with the result that the vanguard of fashionable women everywhere are now seen wearing this crude, cruel shade of rose.

**Hats.**—These change so swiftly that it is hardly safe to record them. The only millinery mode that came to stay in 1937 was the return of veils. (E. PE.)

## Federal Bureau of Investigation

of the United States Department of Justice is charged with the duty of investigating violations of the laws of the United States, collecting evidence in cases in which the United States is or may be a party in interest, and performing other duties imposed upon it by law. The organization was established in 1908 by Attorney-General Charles J. Bonaparte. In 1910 the White Slave Traffic Act was passed, and in 1919 the National Motor Vehicle Theft Act, both increasing and extending the activity of the Federal Bureau of Investigation.

In 1924 Mr. J. Edgar Hoover was appointed director, and in this year the identification division was started with an initial collection of 810,188 fingerprint records.

A series of Federal crime bills was passed by Congress in 1933 placing additional work on the FBI. These included the Federal Extortion act, the Federal anti-racketeering statute, Unlawful Flight to Avoid Prosecution, amendment to the Federal Kidnaping Act, and power of arrest for special agents of the FBI, and authority to carry firearms.

During the 1937 fiscal year, 4,624 convictions were secured in cases wherein special agents of the Federal Bureau of Investigation performed investigative work. The sentences imposed on these subjects totalled 2 death, 13 life, and 13,322 years and 11 months while the total value of recoveries effected, fines imposed, and savings to the Government in cases investigated during this period amounted to \$41,438,370.00. The expense of operating the bureau during the fiscal year 1937 was \$5,815,598.00. Convic

SPECTROGRAPH used in crime detection by the Federal Bureau of Investigation to determine the chemical analysis of minute particles of material

ions were secured of 94.67% of all persons investigated by the bureau who were brought to trial. During the year 2,635 stolen motor vehicles valued at \$1,157,947.81 were recovered in National Motor Vehicle Theft Act cases wherein the bureau performed investigative work. Since the enactment of this act in Oct. 1919, a total of 44,756 stolen motor vehicles valued at \$27,201,463.54 has been recovered.

During the fiscal year 1937, 1,303 Federal fugitives from justice were located by special agents of the Federal Bureau of Investigation in various parts of the country. In addition, 6,223 fugitives from justice were located through the efforts of the fingerprint division of the bureau.

On July 1, 1937, there were 7,360,458 sets of fingerprint records on file in the identification division of the Federal Bureau of Investigation. A total of 1,382,666 fingerprint records was received during the fiscal year and identifications were effected on 54.4% of the criminal fingerprints received. (See also CRIME; KIDNAPPING; LIE DETECTOR; POLICE; RACKETEERING; UNITED STATES: *Crime*.) (J. E. H.)

## Federal Capital Territory

(Australia), containing Canberra, seat of the commonwealth Government, is administered under the commonwealth ministry of the interior, and includes 28 sq.mi. at Jervis bay for a possible port. Area, 940 sq.mi.; pop. (1933), 8,947; number of sheep (1935), 219,000. Canberra is linked with the New South Wales railway system by line to Queanbeyan (4½mi.). The transfer to Canberra of the staffs of the defence and postmaster-general's departments was proceeded with in 1937. The staff college was retransferred to Duntroon (Canberra). Works advanced included the erection of a main administrative block, a new hospital, a high school, housing, and extensions of the water supply and sewerage systems. Finance, 1934-35: receipts, £496,775; capital expenditure, £233,315; other expenditure, £820,819.

## Federal Home Loan Bank System

was created by Act of U.S. Congress on July 28, 1932, to provide reserve credit facilities for the principal thrift and home financing institutions of the United States. It is supervised by the Federal Home Loan Bank board composed of five members appointed by the President. The structure consists of 12 regional banks and their member institutions. The regional banks are located in Boston, New York, Pittsburgh, Winston-Salem, Cincinnati, and Indianapolis, Chicago, Des Moines, Little Rock, Topeka, Portland, and Los Angeles. Each bank is under the management of a board of directors composed

of 12 members, eight elected by member institutions and four appointed by the Federal board. In local matters the banks are largely autonomous. The Federal board, represented in its management by a governor of the Bank System, is concerned mainly with general supervision and the formation of broad national policies, and co-operates with the regional banks in raising the standards of member institutions, in promoting thrift and sound lending practices, and in encouraging the improvement of home construction.

Membership is open to lending institutions making long-term loans on homes. The present membership consists of building and loan associations, homestead associations, co-operative banks, savings institutions, and insurance companies. Institutions approved for membership must invest in the capital stock of their respective regional banks. The secretary of the Treasury was also authorized to buy stock, and at present the Government owns approximately 80% of the aggregate stock of the regional banks. It is contemplated that eventually all of the stock will be owned by the member institutions. The banks obtain their funds, beyond their capital stock, through the sale of debentures and by accepting deposits from members.

The resources of each bank are used mainly to make advances to members for the purpose of providing additional accommodations to local home owners and investors. Under certain conditions, advances for a short term may be obtained without the deposit of collateral. Long-term advances, which may run up to periods of 10 years, must be secured by approved home mortgages or other acceptable collateral. The Bank System has experienced steady and rapid growth. On Jan. 1, 1933, it had but 116 members with assets of \$217,000,000. By Nov. 30, 1937, membership had increased to 3,927 of which 2,582 were State-chartered home-financing institutions, 1,309 Federal savings and loan associations, 27 insurance companies, and nine savings banks; their assets were \$4,080,389,000. On the same date the paid-in stock of the Bank System amounted to \$165,048,991.83, and combined assets of the banks came to \$237,716,092.58. During 1936 institutions which were members of the Bank System made, according to careful estimates, about 43% of the new mortgage loans on urban residential property (houses for from one to four families), throughout the United States. In addition to their duties arising from the administration of the Bank System and the supervision of Federal savings and loan associations, the Federal Home Loan Bank board serves as the board of directors of the Home Owners' Loan Corporation and also constitutes the board of trustees of the Federal Savings and Loan Insurance Corporation. (J. H. FA.)

**Federal Income Tax:** see INCOME TAX.

## Federal Land Banks.

The 12 Federal Land Banks, operating in the United States under the Farm Loan Act of 1916 and subsequent legislation, make long-term, first mortgage loans on farms through 4,500 local, co-operative lending institutions known as national farm loan associations. Since 1933 the land banks and the local associations have operated under supervision of the Farm Credit Administration, which also supervises other Federally-sponsored co-operative institutions providing short-term production credit and loans to farmers' co-operative business organizations.

The total amount of outstanding Federal Land Bank loans, which aggregated \$2,040,000,000 on Jan. 1, 1938, plus \$815,000,000 of Land Bank Commissioner loans made by the Land Banks as agents, represented approximately 38% of the total farm mortgage debt. The Land Bank Commissioner loans, made on second as well as first mortgage security, were first authorized

in 1933 for emergency financing and will be available until Feb. 1, 1940.

The total capital of the 12 Federal Land Banks was \$233,554,360 on Sept. 30, 1937, of which slightly more than one-half was provided, and is owned by, the United States Government. The remaining amount is owned by national farm loan associations and individual farmers borrowing directly from the banks. Funds for making loans are obtained primarily from the sale of farm loan bonds to the investing public. Farm loan bonds aggregating \$1,903,039,960 were outstanding on Sept. 30, 1937.

On Jan. 1, 1938, Federal Land Bank loans were being made to farmers at an interest rate of 4% which is 1% above the rate at which the last preceding bond issue was sold. The rate of interest is temporarily reduced to all borrowers by Act of Congress.

The main influences of co-operative Land Bank financing in the United States over the past 20 years have been the introduction of long-term amortized farm mortgage loans, the gradual reduction of farm mortgage interest rates and, more recently, the "normal value" policy, that is, the use of farm earning power at normal prices of farm products as a principal factor in appraisals to offset boom or depression tendencies in determining the value of farm property for mortgage loans. (W. I. M.)

**Federal Legislation:** see CONGRESSIONAL LEGISLATION.

**Federal Power Commission:** see PUBLIC UTILITIES.

**Federal Reserve System.** Monetary conditions and policies in 1937 were the outcome of developments during the preceding five years. An active policy of monetary ease has been followed by the United States Federal Reserve System since the spring of 1932. The System increased its holdings of Government securities during 1932-33 from \$800,000,000 to \$2,400,000,000. As a result, member banks were able to retire practically all of their indebtedness at the Federal Reserve banks and in addition accumulated by the end of 1933 about \$800,000,000 of excess reserves. Following the passage of the Gold Reserve Act in Jan. 1934, and the subsequent reduction of the gold content of the dollar, gold flowed into the United States in large volume and bank reserves were greatly increased. Excess reserves rose by the end of 1935 to over \$3,000,000,000 and continued at close to this level during the first half of 1936. In July 1936, the board of governors acted to increase reserve requirements by 50% thus absorbing about \$1,500,000,000 of these excess reserves.

In Dec. 1936, the U.S. Treasury, after consultation with the board of governors, adopted a policy of placing additions to the gold stock in an inactive gold account so that member bank reserves were no longer subject to expansion from this source. At the end of Jan. 1937, the board of governors announced a second and final action to absorb excess reserves by increasing reserve requirements to the full extent authorized by law. One-half of this increase became effective on March 1 and the other half on May 1, 1937. After the final action took effect on May 1, excess reserves of member banks were still approximately \$900,000,000 and were widely distributed among all classes of member banks. The board stated, in announcing final action, that it was a precautionary step which would place the Federal Reserve System once more in a position where it could rely upon its traditional and more flexible monetary instruments of open-market and rate policy for easing or tightening credit conditions as changing circumstances might require.

At the turn of the year 1936-37 the previous prolonged advance in high-grade bond prices ceased and early in 1937 there was a decline, due to a number of factors, including possibilities of an inflationary development. Bond prices in England had

already begun to decline. There had also been an overloading of the new issues market with offerings of bonds bearing exceptionally low coupon rates and some of these were overhanging the market. Prices of high-grade municipal and corporate bonds had declined for some weeks before there was a marked decline in U.S. Government obligations. Under these conditions banks and other investors with substantial paper profits on their bond holdings began to sell in order to realize these profits. After prices began to decline others sold to avoid losses. A few large money-market banks in making adjustments in their reserve positions to meet increased reserve requirements also contributed to this movement.

Because of development of disorderly conditions in the bond market in March, and in accordance with the purpose of relying upon open-market operations for meeting changing credit conditions, the System through the Open Market Committee at first purchased Government securities of longer maturities that showed weakness and disposed of securities of shorter maturities, without changing the total holdings in the open-market account. This was followed by the outright purchase of \$96,000,000 of Government securities in the open market, which were added to the account. Conditions in the bond market became steady early in April and the decline in Government security prices ceased.

Throughout the year banks had sufficient funds to care easily for credit needs of business. In August it appeared, however, that during the autumn the usual seasonal demands for currency and credit might result in tighter credit conditions which might lead to further liquidation of assets. Prices of stocks and of basic commodities, moreover, were showing further declines and evidences of weaknesses in the business situation were becoming increasingly apparent. Therefore during August and the early days of September the Federal Reserve banks reduced their discount rates. After these changes were made the rate of the Federal Reserve Bank of New York was 1%, the lowest central bank rate in history, and at the other Federal Reserve banks 1½%. The board also issued in September a revised and liberalized Regulation A, relating to advances and discounts by Federal Reserve banks for member banks, in accordance with changes in the law made by the Banking Act of 1935.

In September, at the request of the board of governors, the Treasury released \$300,000,000 of gold from its inactive account and at the same time the Reserve System announced that it would be prepared to buy additional Government securities in order that seasonal demands for currency and credit would not have the effect of tightening credit conditions. The release of gold was made by the Treasury about the middle of September and the proceeds were immediately expended. The additional reserves thus provided went mostly to banks in New York city and in Chicago, which generally bear the brunt of seasonal increases in credit demands. In November, in anticipation of holiday currency demands, the Federal Reserve System purchased \$38,000,000 of Government securities in the market. Partly because of action taken by the Treasury and the Reserve System and partly because the seasonal credit and currency demands were smaller than usual, owing to the recession in business that developed member banks were able to meet the seasonal demands without pressure on their reserves.

In October the board of governors reduced margins required on security loans both by banks and by brokers from 55 to 40%. The higher margins had been imposed early in 1936 at a time when security prices were rapidly advancing and security loans were increasing. The fact that the margins had been high had resulted in a smaller amount of margin calls and less forced liquidation when security prices declined, than would otherwise have been the case. When the decline in security values continued, because

of a change in the business outlook, the board eased conditions for the purchase of securities by a reduction in the required margins.

Credit conditions continued to be extremely easy. Excess reserves of member banks averaged over \$1,000,000,000 during the last three months of 1937, an ample amount to meet all current and prospective demands for credit. Private and institutional investors also held a large volume of idle funds. Short-term money rates and customers' rates of banks in leading cities were close to their all-time lows. Yields on long-term Government securities and on high-grade municipal and corporate bonds, which had increased during the first part of the year, declined later and at the end of the year were exceptionally low in relation to levels prevailing prior to 1936. Monetary and credit conditions at the close of the year continued to be favourable for encouragement of business activity and general economic recovery. (M. S. E.)

**Federal Theatre** is a project of the United States Works Progress Administration, organized under the Emergency Relief Appropriation Act of 1935 to give employment to needy professional theatre people. Payment at a security wage is less than the prevailing pay for corresponding work in industry, but adjusted, through hours, to meet that wage. Nine out of ten employed come from relief rolls. Nine dollars out of ten must be spent for wages, leaving only one dollar out of ten to meet all theatrical and operating costs. At the outset of the program 12,700 people were employed in 29 States. Through decreased congressional appropriation and the return of many theatrical people to private industry employment in January 1938 was 8,905 in 20 States. Directors and designers have consistently offered an ambitious program of classical and modern plays, dance dramas, marionette shows, musical comedies, children's plays, and cycles by such distinguished dramatists as Eugene O'Neill and George Bernard Shaw.

The Federal Theatre has invented the technique of the "Living Newspaper," a terse cinematic type of production dealing with such social and economic subjects as agriculture, power, flood control and housing. Through its playwriting and research divisions the Federal Theatre is conducting experiments in the fields of writing, design and light. It also provides script, advisory, and publication service for great numbers of community theatre groups.

Sponsorship is wide and varied, and includes theatrical and other unions; universities; churches, Catholic, Jewish, and Protestant; civic and community groups; and a great following of youth never before able to afford theatre-going. Critics have come to regard the Federal Theatre as a People's Theatre. (H. FL.)

**Federal Trade Commission.** This commission deals with conditions in interstate commerce relating to monopoly and unfair methods of competition in the United States and makes investigations into the organization and practices of business corporations, except common carriers and banks.

The commission's functions were increased in 1936 by the Robinson-Patman amendment of the Clayton Act further restricting price discrimination, quantity discounts and certain other indirect kinds of discrimination. On the other hand, the Miller-Tydings amendment of the Sherman Anti-Trust Act, in 1937, limited the commission's jurisdiction regarding resale price maintenance in inter-State commerce affecting sales made in States following that practice. During 1937 (up to December 1) there were 299 cases in which complaints had been issued which were finally disposed of by the commission. In 232 of these cases in-

junctive orders were issued, among which may be noted the following: (a) for price fixing—viscose rayon yarn manufacturers, National Electrical Manufacturers Association, water works valve and hydrant manufacturers; (b) for price discrimination—window glass manufacturers; (c) for brokerage discrimination—Biddle Purchasing Company; (d) for boycott—metal roofing and air-conditioning contractors. In this same period, seventeen decisions were rendered by Federal courts on appeals from orders of the commission. One case was declared moot, without decision on the merits. In an inquiry ordered by Congress, National Biscuit Company declined to furnish the commission with certain information called for, particularly the amount of sales. Mandamus proceedings were resisted and the Federal court in New York handed down a decision, February 16, 1937, in favor of the commission. No appeal was taken. Numerous trade practice conferences with various business groups resulted in the establishment of specific rules of fair dealing.

The general investigatory authority of the commission was exercised during 1937 under two Congressional resolutions. The first dealt with agricultural income and income of the principal manufacturers and distributors of farm products, monopolistic or unfair practices of manufacturers and distributors, portions of the total consumer cost going to different factors of production and distribution, agricultural co-operation, etc. In conclusion, three reports were submitted to Congress during 1937. The second resolution called for information regarding restraints of trade and unfair methods of competition in the farm machinery industry, the costs, prices and profits of manufacturers and distributors, etc. This inquiry was not completed at the close of the year. By executive order, an inquiry was begun in Nov. 1937, into the cost of living. (See also CHAIN STORES.) (FR. W.)

**Federated Malay States,** area 27,540 sq.mi., population (1937) 1,961,397, are one of the three main subdivisions of British Malaya, the others being the Straits Settlements and the Unfederated Malay States (*q.v.*). There are four Federated Malay States, Perak, Selangor, Negri Sembilan and Pahang, of which the first three are on the west coast of the Malay Peninsula, while Pahang is on the east coast. Each State is administered under the advice of a resident, who is subject to the instructions of the High Commissioner, who is also governor of the Straits Settlements. The seat of the Federal Government is at Kuala Lumpur (Selangor), the largest town in the States, with a population of 127,124. The Federated Malay States contain 1,068mi. of railway and 2,916mi. of metalled roads. They constitute the immediate hinterland of the two main ports of the Straits Settlements, Singapore and Penang, and are rich in minerals and raw materials, especially tin and rubber. Other important products are coconuts, oil palms, rice and pineapples; and there are deposits of coal and gold. Chinese labour is largely employed in the tin mines and there are many Indian workers on the rubber plantations. The Malays devote themselves more to hunting, fishing and agriculture. The tin and rubber industries experienced great difficulties because of the precipitous fall of prices in 1931 and 1932. World restriction schemes, combined with the improvement in general economic conditions brought about a gradual recovery, and in 1936 there was even a mild boom. (W. H. CH.)

**Federation of Labor, American:** see AMERICAN FEDERATION OF LABOR.

**Feldspar.** Almost the entire commercial utilization of the feldspars is in the ceramic and glass industries. The United States is the world's largest producer and consumer,

followed by Sweden, China and Norway, with a number of minor producers. World production is of the order of 350,000-400,000 metric tons, of which the United States contributes somewhat more than half. The 1936 consumption in the United States was about 51% in glass, 32% in pottery, 10% in enamel and sanitary ware, 3% in brick and tile, and 2% in electrical porcelain, leaving 2% for miscellaneous uses, most of which are of a ceramic character. Production in 1936 had almost doubled over the 1932 low, but was still slightly below the pre-depression high. (G. A. Ro.)

**Fencing.** Fencing has many enthusiastic followers in the United States. The chief governing body is the Amateur Fencers League of America, headquarters in New York, having 971 members in 18 divisions scattered throughout the country; there are also about a dozen more fencing leagues of lesser importance. The officers of the A.F.L.A. for 1937 were Harold Van Buskirk, president; James Warner Bellah, vice-president; John Howard Hanway, treasurer; Dernel Avery, secretary. Dr. Graeme M. Hammond, one of the founders of the League in 1891 and its president until 1925, who retains an active interest in the sport, is president emeritus of the American Olympic Committee.

The sport of fencing is rapidly expanding in scope and interest by its introduction into high schools and colleges and the establishment of private fencing salles to supplement the fencing clubs. The A.F.L.A. developed a new electrical mechanism in 1937 to be worn by épée fencers to register each touch. The national rankings for 1937 in the League were: foil, Joseph L. Levis, Jose R. de Capriles and Dernel Avery; épée, Lt. Thos. J. Sands, Tracy Jaeckel and Andrew Boyd; sabre, John R. Huffman, Normal C. Armitage and Jose R. de Capriles; women's foil, Helene Mayor, Carol Alessandrini and Dolly Funke. (J. B. P.)

**Great Britain.**—Fencing has passed through a momentous year, important moves having been made in connection with the sport. A recent census, the first ever taken, showed that there are now something like 3,500 fencing enthusiasts in Great Britain.

There has also been what practically amounts to a complete reorganization. This has included the formation of various subcommittees of the Committee of the Amateur Fencing Association, and the formation of a North and Midlands Section, with headquarters at Birmingham.

Another important item has been the adoption of a new edition of the Rules of Fencing, derived from a translation of the International Rules. The publication *World Sports* has been adopted as the official organ of the A.F.A., and a quarterly news bulletin is now issued to all affiliated clubs. It is hoped, by means of these changes and innovations, to put fencing in Great Britain on a thoroughly organized and common basis. The effort in this direction was given timely encouragement when the Association received royal patronage for the first time.

A full team was sent to the World Championships in Paris, but the results did not quite fulfill expectations. The London Fencing Club this year established a precedent by "housing" the winners of the three major championships: J. Emrys Lloyd won the foil championship, C.-L. de Beaumont the épée championship, and R. F. Tredgold the sabre championship. The Miller-Hallet International Épée Cup was won by J. Bruneau, of Belgium.

**Fernando Pó:** see SPANISH WEST AFRICA.

**Fertilizers.** The use of commercial fertilizers in world agriculture shows notable and persistent increase. A recent study, covering 40 years, of 14 great wheat-growing regions shows that the trend of yield is upward in all regions where

fertilizer application is standard practice, and downward in all others. For example, it is upward in Western Europe, downward in South-eastern Europe; upward in Australia, downward in South America; upward in Eastern United States, and downward in the prairie provinces of Canada and the prairie States south of them. Other great crops, notably cotton, show like trends.

Fourteen elements are held essential to plant growth. These are: nitrogen, phosphorus, potassium, calcium, carbon, hydrogen, oxygen, magnesium, iron, sulphur, manganese, boron, copper, and zinc. The carriers of nitrogen, phosphorus, and potassium are considered the most indispensable ingredients in commercial fertilizers because most farm soils are deficient in these elements. Likewise, crops remove them and calcium in larger quantities than the other ten. Carbon, hydrogen, and oxygen are obtained by plants from air and water. With continued cropping it has become progressively apparent that certain soils are deficient in one or more of the remaining seven elements, now commonly referred to as the minor or trace elements. As a rule, it is necessary to add only relatively small amounts of the deficient elements.

Many symptoms in growing plants that had been considered due to some disease or fungus growth were found to be caused by lack of one of the minor elements. Magnesium deficiency causes the condition known as "sand drown" in tobacco; manganese deficiency causes chlorosis in tomatoes and other crops; boron deficiency causes "black heart" in mangels and sugar-beets and "cracked stem" in celery; while zinc deficiency causes "mottle leaf" of citrus trees.

In recent years much progress has been made in determining the best methods of application and placement for numerous crops. Generally speaking, the closer the fertilizers can be put to the seed without damaging germination, the better the results. Outstanding manufacturing developments are: treatment of superphosphate with anhydrous or aqua ammonia, fixing the ammonia in the form of an ammonium phosphate; continuous processes for the manufacture of superphosphate, supplanting the old intermittent or batching processes; and granulation of fertilizers and fertilizer materials.

World consumption of pure nitrogen in agriculture was 1,460,000 metric tons for the year ended June 30, 1928, as compared with 2,344,000 tons ten years later. World production of superphosphate was 14,065,000 metric tons in 1927, and 15,622,000 tons in 1936. World production of potash was 1,997,000 tons of K<sub>2</sub>O in 1927, and 2,402,000 tons in 1936. (See also POTASH.)

**Field Hockey,** a very ancient game, is widely played in Europe, most of the British Empire, Japan and to some extent in other countries. Primarily a men's game, it is now played quite generally by women under practically the same rules. Although England is regarded as the birthplace of modern hockey, the game has reached its greatest development in British India where it is played by hundreds of thousands of persons, both in the army and in civilian life. Teams representing British India won the Olympic championship in 1928, 1932 and 1936.

The modern version of the game was taken up in the United States first by women shortly after the turn of the century. Men did not take it up until about 1926. Consequently, although field hockey is played by a great many girls' school, college, and club

teams, there are as yet only a few men's teams. The men's clubs are located chiefly in and around New York, Philadelphia and Baltimore. The game is also played informally at a number of men's schools and colleges. The men's sport is governed by the Field Hockey Association of America which is affiliated with the American Olympic Association and the Fédération Internationale de Hockey. Men's teams representing the United States competed in the Olympic games of 1932 and 1936. With a view to keeping field hockey on the strictly amateur basis on which it exists throughout the world, the Field Hockey Association of America follows the example set by the board governing the sport in England and does not sanction any leagues, cups or national championships.

Women's field hockey is governed by the United States Field Hockey Association in co-operation with a hockey committee of the women's section of the American Physical Education Association. Each year a conference is held, usually in late November, for the discussion of rules and matters pertaining to the players' welfare. At the same time the national association conducts a round-robin tournament for sectional teams in its membership. No championship is involved, the purpose being to select an all-America team from among the regular and reserve teams participating. In 1937, at Winnetka, Ill., the South-east, North-east, Mid-west and Great Lakes competed, and the South-east's first team was the only unbeaten contestant. (H. K. G.)

**Fiji.** Crown colony of the British Empire. Governor, Sir Arthur Richards, K.C.M.G., who is also high commissioner for the western Pacific. It comprises some 250 islands (about 80 inhabited) between lat. 15°S. and 22°S. and long. 177°E. and 178°W. Total area, 7,083 sq.mi.; pop. (census, April 1936): Europeans, 4,028; Fijians, 97,651; Indians, 85,002; others, 11,698; total 198,379. Capital, Suva; pop. (1936), 15,522; regular port of call for mail shipping between New Zealand and North America. Finance (1936): revenue, £796,630; expenditure, £677,152. Trade (1936): imports, £1,501,854 (from U.K., £526,690); exports, £2,135,427 (to U.K., £842,874). A new constitution was introduced in 1937: the legislative council now consists of the governor, 16 official members, five Europeans, five Fijians selected by the governor from a panel submitted by the Great Council of Chiefs, and five Indians. The executive council consists of the governor, five chief civil servants, and two nominated unofficial members. (See also PACIFIC ISLANDS, BRITISH.)

**Filene, Edward Albert** (1860-1937), Boston merchant and student of economic organization, was born at Salem, Mass., Sept. 3, 1860. After a high school education, he entered the Boston department store of William Filene's Sons of which he was ultimately to be president. It was his interest in the study of means for economic betterment, however, which won him national recognition. In addition to participating in the establishment of the Boston, United States and International Chambers of Commerce, he established the Twentieth Century Fund in 1919, contributing over a million dollars for the study of economic problems. Long before the New Deal, he championed measures for re-organizing the capitalistic system in order to increase the buying power of the public. As a result, he urged such advanced plans for economic re-adjustment as distribution of wealth through increased wages, unemployment and old age insurance, regulation of hours and wages and co-operative buying. His chief interest was in the consumer credit movement, he being both founder and president of the Credit

SECURITIES ISSUED in the United States: monthly average (Federal Government issues not included). Lower part of column shows new capital; upper part, refunding. Compiled by *Commercial and Financial Chronicle*

Union National Extension Bureau which directs the organization of co-operative credit associations in both the United States and Canada. Although active in Washington during the World War, he turned his attention to peace efforts immediately thereafter, receiving several European citations for financing the European peace awards of 1924. In more recent years, however, he became discouraged at the ineffectiveness of peace agencies and urged the voluntary surrender of raw material monopolies as a necessary step to avoid conflicts. It was during one of his frequent trips to study European conditions that he died in Paris, Sept. 26, 1937.

**Financial Review.** The outstanding fact in the financial history of 1937 was the fall in commodity and share prices after a rapid rise in the first three or four months of the year. This fall of prices had important secondary reactions on international capital movements, exchange rates, public finances, rates of interest, etc. In Great Britain, wholesale prices (1929=100, *Economist* index) rose to 94.4 in March from a level of only 80.7 in Oct. 1936. By Nov. 1937, the index had dropped to 77.0. In the United States, the peak occurred later, with the index (Bureau of Labor, 1926=100) at 88.0 in April, and the fall was less marked, only five points being lost by mid-November. Statistical differences, however, largely vitiate such international comparisons. In fact, practically all raw commodities entering into world trade suffered a sharp fall of price after April 1937.

One striking consequence was a complete reversal of the trend in the international control of the supply of primary commodities. At the beginning of 1937, the authorities of most restriction schemes were relaxing and often releasing altogether their restraints on supply, in an anxious attempt to forestall shortages or speculative price inflation. Thus the International Tin Committee raised the permissible quota after the first quarter of the year to 110% of standard tonnages, an unattainable figure for most countries in the scheme. A series of attempts to overtake rising prices brought the rubber quota from 65% for the second half of 1936 to 90% for the second half of 1937. The copper committee temporarily removed all restriction in Jan. 1937, but reimposed it in November at the rate previously ruling. The rubber quota for the first quarter of 1938 was fixed at 70%, and the tin quota was cut at one blow from 110% to 70%. Yet the prices of all these commodities remained much lower than they

had been at the beginning of 1937.

The causes of the fall in prices are relevant here only in so far as they had a financial character. Among the proximate causes was the so-called gold scare. The high price of gold established by currency devaluation attracted a rising output of the metal, whereas the monetary outlets for it were strictly limited. Between 1930 and 1936 world output of gold rose from 21,000,000 oz. to 35,000,000 ounces. By far the greater part of this gold found its way indirectly to the United States. At considerable cost to the American Treasury, most of it was sterilized, that is to say, not allowed to serve as a base for currency inflation. The American buying price of \$35 a fine ounce was the only fixed pivot (bar the small Belgian market) in the relations between the principal currencies and gold. At the beginning of April 1937, the arrival in London of large consignments of gold from Russia was followed by rumours that the United States Treasury intended lowering its buying price. The rumours were promptly denied in Washington, but gold-mining shares and international securities remained depressed, and the disturbance began to spread to other security and commodity markets.

The reason for this extension was twofold. First it was thought that, just as the high price for gold had been associated with rising commodity prices, so a reduction in the price for gold would somehow lead to a lower general price level. Secondly, there had been widespread speculation, both professional and public, in commodities as well as stocks and shares. When one speculative market sustained losses, these often had to be covered by liquidation in other markets. An illustration was the reaction in London to the National Defence Contribution (*q.v.*). This graduated company income-tax had no direct relation to commodity markets, yet it was followed by a recession there as well as on the stock exchange. The gold scare itself may similarly be regarded as a signal rather than a reason for the fall of commodity and stock prices (except, of course, those of gold shares). Speculative buying in earlier months had driven the prices of many commodities above the levels indicated by costs of production, rates of supply and probable consuming power of industry or private consumers.

The gold scare was violently renewed at the end of May. Hoarded gold was flung on the London market, and the greater part of it found a buyer only in the Exchange Equalization Funds (*q.v.*), which bought £4,000,000 of gold on June 4 alone. On that day President Roosevelt flatly denied that his Government's policy had changed, and the scare gradually died down. Partly as a result of the strain put upon it by purchases of gold, which exceeded £92,000,000 net between March 30 and Sept. 30, the Exchange Equalization Account was raised by £200,000,000 to £575,000,000. By November, the position had been completely reversed: gold commanded a premium in London against the parity with the dollar; hoarding had been renewed, and there were even rumours that the dollar might be further devalued.

Meanwhile, however, great changes had taken place in the structure of commodity and more especially stock market prices. On March 10, 1937, the price index of industrial common stocks on Wall street (Standard Statistics Company, 1926=100) touched a peak of 155.7, compared with an average of 127 for the whole of 1936. In May, the average was down to 137, and after a series of oscillations the fall was renewed after August. On Nov. 24, the index dropped to 86.7. On the London market, though the fall began earlier, it was less severe. The ordinary shares index (*Financial News*, July 1, 1935=100) reached its peak of 124.8 on Jan. 4, and fell to 93.1 on Nov. 22. Both in London and in New York there was some recovery in the last few weeks of the year. Although 1937 saw a certain depression of fixed-interest securities also (the yield on British 2½% Consols, for instance, rose during the year from £2 19s. to £3 7s.), this section of the

market often showed strength when the more speculative sections were weak. The depression in industrial securities therefore seems to have been due to business apprehensions, and to the liquidation of speculative positions, rather than to any general financial stringency.

Indeed, easy monetary conditions continued throughout 1937. The New York Federal Reserve Bank, on Aug. 26, reduced its rediscount rate from 1½ to 1%—the lowest level ever established by any central banking institution. On Jan. 30, the Federal Reserve Board had announced increases in the reserve requirement for member banks, designed to immobilize some \$1,500 millions of excess reserves which the board regarded as superfluous for the needs of commerce, industry, or agriculture, and as capable of causing an injurious expansion of credit. Nevertheless, member bank excess reserves totalled \$1,160 millions at the end of 1937, compared with \$1,950 millions at the beginning of the year. The Bank of England discount rate remained at 2% throughout the year, and the market rate on Treasury bills was maintained above ½% only by dint of special arrangements between the money market and the banks, and among the money market operators themselves. The Netherlands and Swiss bank rates were likewise unchanged in 1937, at 2% and 1½% respectively. The Bank of France discount rate, which began the year at 2%, was raised to 4% in January and to 6% in June in order to counter the external weakness of the franc. Thereafter, however, it was progressively reduced to 3%.

The belief that the devaluation of 1936 would bring stability to the French franc and reverse the flow of capital from France was shattered in 1937. The economic reforms introduced by the Popular Front Government, and the persistence of budget deficits, continued to frighten capitalists, while the competitive advantage for French trade was nullified by the rise of internal costs. The French Exchange Fund suffered heavy losses of gold, and

"HERE'S THE TIRE! YOU GET THE JACK!" The building movement to speed business recovery calls for some co-operative effort, so Elderman depicts in *The Washington Post*

"TWO OF THE WHEELS OF RECOVERY," as York of *The Louisville Times* sees the business recession in the United States

neither the raising of the Bank of France discount rate nor the formation of a new government under M. Chaumets allayed anxieties. Indeed these events stimulated rumours of an impending further cut in the gold value of the franc. By June, the exchange value was equivalent to the lower gold limit (corresponding to roughly 110 francs to the £) that had been prescribed by the post-devaluation monetary law.

The rumours caused a large discount to appear on the forward franc. On June 29, dealings in francs were suspended in London and New York; French financial markets were closed; and a Plenary Powers Bill passed the finance committee of the French Chamber, after an admission by M. Bonnet, the finance minister, that the Government had only 20,000,000 francs of ready money at its disposal and that the outflow of gold since June 23 had totalled 2,500 million francs. On the following day, the Plenary Powers Bill passed into law, the limits on devaluation were repealed by decree, and the Government announced that the franc would be left to find its own level, subject to the control of fluctuations by a stabilization fund.

When the markets were reopened on July 1, the franc was bought and sold at 129 to the pound. The British chancellor of the exchequer and the secretary of the United States Treasury sent messages indicating that they regarded the Tripartite Monetary Agreement of Sept. 1936 as still in force, and that they would continue to co-operate with the French monetary authorities. Later in July, as capital was still leaving France, the franc was weak, and touched 135 to the pound, but until mid-September the rate stayed near 133. On Sept. 10, and again on Sept. 16, there was a serious break, and after another pause the rate jumped on Oct. 2 to 151½, the lowest sterling value recorded for the franc since 1926. This, however, was the worst rate of the year. At the end of 1937, the franc was worth 147¼ to the pound.

The strength or weakness of the franc followed in the main the

movement of capital for short-term investment (known generally as "hot money") to or from France. There were brief periods in the earlier part of 1937 during which refugee capital returned, but the flow did not take a definite inward trend until the last quarter of the year. In six months, so M. Bonnet told the Senate at Christmas when defending his budget estimates, the Bank of France had gained 10,000 million francs of gold. Of this, 4,000 millions had been furnished by the stabilization fund from its purchases, and 6,000 millions had been released from serving as collateral for a credit of £40,000,000 for the French railways, which had been opened by a London banking group in January and had been fully repaid. M. Bonnet was budgeting for a small surplus in 1938; the extraordinary budget, however, would carry on loan account over 14,000 million francs of expenditure on armaments and public works.

Movements of "hot money" were more important in international balances of payments in 1937 than any long-term capital migration. Even the speculative investment of non-American money in Wall street, which had been outstanding in 1936, fell to an insignificant figure, and the latter part of the year saw some liquidation of earlier investment of that kind. On the other hand, in the six months ended June 30, United States banking funds abroad declined by \$55,000,000, and foreign banking funds in the United States increased by \$708,000,000. There were practically no new foreign issues in the United States in 1937, and such issues in London totalled only £27,400,000, including £21,100,000 for British Empire countries.

The year brought mixed news for markets in foreign bonds. Higher commodity prices and general recovery in the earlier months caused several debtor countries to increase their payments. Better returns from copper and nitrates, for instance, raised the sum available for service of Chilean bonds. The League Loans Committee in London reported in September that all the countries that had been in partial default on League loans, with the exception of Greece, were paying more. A permanent revision of the Hungarian 7½% loan on a lower interest basis was recommended to bond holders by the committee. Greece, which up to March had been remitting 40% of the interest due, had failed to make what the committee regarded as a reasonable proposal for a permanent settlement, offering to pay only 50% and to establish after five years a 60-year sinking fund. This offer had been rejected and withdrawn. Apart from the League Loans, Poland increased the extent of her default early in 1937. On Nov. 10 the promulgation of a new constitution in Brazil by President Vargas was combined with suspension of payment of all interest and amortization on external debt. It was announced that the question of future payment would be examined immediately, preference being given to countries with which Brazil had a favourable trade balance. A further blow to foreign bond holders was the war in China, which resulted in a fall in Chinese 5% bonds (1913) from 95 to 65 on the London market in the course of 1937, and of Japanese 6% bonds from 88½ to 64.

## Fire Insurance.

As the year 1937 progressed, indications were that the low loss record of the previous four years would probably continue and as a result certain trends developed. First and foremost of these was the general plea for a reduction in the rates of fire insurance. In many instances, reductions were considered and granted through the central organizations of the fire insurance business. In others, governmental authorities were active and did not hesitate to suggest reductions which were often made, usually after conferences with the officials.

There appears to be developing a marked tendency to seek to fix the fire insurance rates for the succeeding year on the ex-

perience of the previous five years. It so happens that, due to the low loss ratio and the lack of any outstanding fires which could be considered conflagrations, this tendency is resulting in a downward revision of rates and it is a safe statement to make that the average rate for fire insurance decreased probably 5% during 1937. The effect of this close connection between the rate and the previous five years' experience cannot be predicted for the future. A severe conflagration, such as the great fire at San Francisco in 1906, would change the whole picture; if it did not increase the rates, it would probably stabilize them for some years to come. This tendency in regard to the rate is world-wide.

The second outstanding feature of 1937 was the more complete development of the method of writing what may be called "auxiliary" or "accessory" lines. The policy of fire insurance is strictly limited by its terms to the indemnification of the insured for the value of the property damaged or destroyed by fire. Unless additions are made to the policy by endorsement or unless the policy is supplemented by independent contracts, other forms of loss are not covered.

The point has now been reached where by an endorsement to the fire policy, known as the Extended Coverage Endorsement, losses from the following causes may be covered in addition to the loss from fire and as a part of the regular fire policy: wind-storm, cyclone, tornado and hail, explosion, riot, riot attending a strike, aircraft, smoke, and vehicles.

Another development during 1937 was the passage by the State of Illinois of its new insurance code. This represented the work of two or more years and, by and large, is considered very satisfactory. It will no doubt have an influence on the revision of other codes now being considered. (E. R. H.)

## Fires and Fire Losses.

An underwriting profit in fire insurance represents the difference between the amount of premiums received and the amount paid for losses plus all other expenses of whatever form or nature, not including dividends of course. As a rough measure, a loss ratio of 50% may be considered as one on which the business can be carried forward satisfactorily. A few years ago before taxes had increased as they have in the past five years, a loss ratio of 55% might have been considered as not unduly excessive. It so happens that during the last five years the loss ratio in fire insurance, world-wide, has been less than the stipulated 50%. The results, therefore, have been favourable to the business, the increased taxation and the depreciation in security values being thus compensated for in part.

In the year 1937, \$800,000,000 is a fair estimate of the amount of premium receipts in fire insurance throughout the world and 40% of that is a fair estimate of the losses incurred on the same world-wide basis. In the United States the mutual system of insurance is very highly developed and the loss ratios of the mutual fire companies ran practically the same as those of the stock companies.

It is an interesting fact that while severe fires do occur all over the world, nevertheless, the large amounts involved are averaged down by the small losses which make up the largest percentage of fire losses. In Great Britain the notable losses usually occur in mansions, the factories being fairly well protected on the whole; while in the United States the most severe losses are apt to occur in manufacturing or mercantile properties, although the rapid extension of the best types of protection is tending to eliminate large losses in these properties also. COLUMBIA RIVER fishing fleet opens salmon season, with 300 boats putting out from Astoria, Oregon, in a mass demonstration of the river's salmon industry

**Fisheries.** The fisheries of the world, according to tabulations compiled by the U.S. Bureau of Fisheries, annually yield about 15 million tons of 2,000lb. each, of food or products used in the arts and industries, with a value of about \$716,000,000. Of this amount, the fisheries conducted in the North Atlantic area by bordering countries produce about 5,900,000 tons, valued at \$350,000,000; with the production by Eastern North Atlantic countries amounting to 4,700,000 tons, valued at \$302,000,000 and by Western North Atlantic countries to 1,200,000 tons, valued at \$48,000,000.

The species of importance taken in the North Atlantic area are herring, cod, haddock, mackerel, halibut, swordfish, crabs, shrimp and oysters. During recent years the abundance of several of these species has declined, due to over-fishing or other causes. Recognizing that this is a serious threat to the livelihood of thousands of fishermen and shoresmen, steps have been taken by the Governments of various countries to conserve several of these important species.

On the Eastern North Atlantic the situation is particularly serious, since fishing vessels must now travel great distances from the home port to obtain a catch. These longer voyages entail increased costs, not only in the operation (fuel, upkeep, etc.) of the vessels, but also for icing or refrigerating the fresh fish brought to port. In an effort to improve conditions, various conservation and economic measures were suggested during the past year. As regards conservation measures a convention was signed during the past year on behalf of the Governments of Belgium, Denmark, Germany, Great Britain, Iceland, the Irish Free State, the Netherlands, Norway, Poland, and Sweden. This convention, among other things, regulates the size of the meshes

of otter trawls and seine nets fished from vessels of the signatory countries in certain waters of the Eastern Atlantic. It is hoped that through regulations under this convention the fish population on the grounds of the Eastern North Atlantic will be repleted, since it is expected the regulations will call for mesh of larger size, which will allow small and immature fish to escape and give them a chance to reproduce.

As regards economic measures, various plans have been suggested or tried with several of the Eastern Atlantic countries. These are intended to promote the more orderly marketing of fish. Some have been aimed at lowering tariff walls and trade barriers; others at reducing the landings of fish to prevent market gluts; and still others at improving quality.

On the Western North Atlantic a somewhat parallel situation has existed, as regards the need for fishing vessels to travel farther and farther from the home port, because of depleted stocks nearer port. During 1937 this led to the construction of larger and more modern vessels of the otter trawl type. In general these vessels are capable of making faster trips to the fishing grounds as some have speeds of 12 knots or more. These vessels also have improved facilities for refrigerating the fresh fish brought to port. In an effort to replete the haddock fisheries of the Western North Atlantic, especially on Georges Bank where depletion of this species has been more evident, operators of United States and Canadian trawl vessels, in the spring of 1937, formed a voluntary compact among themselves by which they agreed to adopt mesh of larger size in the cod end of the otter trawls, in order to allow juvenile fish to escape. Most of the trawlers fishing for haddock and cod are now using the mesh of larger size. At a meeting in Montreal in Sept. 1937, the North

American Council on Fishery Investigations applauded this action and hoped that this voluntary compact on the part of the industry would be made permanent by some form of international agreement between the countries prosecuting the haddock fishery of the Western North Atlantic.

As regards the economic fishery situation in the United States, efforts were directed in 1937 toward stabilizing the frozen fish trade. Early in the year the sale of frozen fish was retarded because of mild weather conditions being conducive to the production and consumption of fresh fish. This resulted in the accumulation of large surplus stocks in cold storage during the months of January and February. This caused apprehension among many members of the fishery industry lest these stocks be carried over to later in the year and result in curtailing the demand for spring- and summer-caught fish for freezing purposes. The situation was brought to the attention of the U.S. Congress which enacted measures early in the year, authorizing the Federal purchase of surplus frozen fish for distribution to relief clients. This had a stabilizing influence in that it opened the channels for the normal sale of fresh-caught fish to freezing concerns. It also resulted in acquainting many people with fishery foods, since considerable of the frozen stocks was distributed to people living in the interior of the United States, where the consumption of fish has not been large. In Newfoundland, the plight of the fishers was given further study in 1937 and measures were promulgated to improve their welfare. This consisted mainly of Government provision for outfitting the fishermen and in taking steps to improve methods for the curing and marketing of fish. In the Maritime Provinces of Canada further progress was made during 1937 in the formation and operation of co-operative associations of fishermen.

**Whaling.**—For the past two decades, various nations of the world, notably Norway and Great Britain have been prosecuting the whale fisheries with renewed vigour. Operations have centred almost entirely in the Antarctic, where previous to this time little whale fishing was done, because of dangerous weather and ice conditions. With improved methods for capturing whales, however, and for their manufacture into oil aboard the large and staunchly built factory ships now used, these conditions have constituted no obstacle. The take in recent years has been enormous; for instance, during the period from the season of 1919-20 to the 1935-36 season, inclusive, 302,734 whales were captured in the Antarctic, from which 23,922,688 barrels of oil have been produced, according to Report VIII (1937) of the Committee for Whaling Statistics, Oslo. One barrel of about 50 gallons equals  $\frac{1}{2}$  ton. One ton equals 1,016kg. or 2,240 pounds. From the same report we find that during the 1935-36 season alone 30,991 whales were captured in the Antarctic fishery, from which 2,436,338bbls. of oil were produced. Norwegian whaling accounted for 14,421 whales, with an oil production of 1,116,033bbls.; British whaling accounted for 12,538 whales with an oil production of 995,167bbls.; and the whaling of other countries in this area accounted for 4,032 whales with an oil production of 325,138 barrels. During this season 7,186 men took part in the Antarctic whale fishery, all of whom except 455 were Norwegians.

Because of the intensive hunt for whales in recent years, many conservationists felt that some regulatory measures were necessary to prevent the complete extermination of this marine mammal. If this did occur, it of course would mean the loss of a valuable economic resource. This apprehension led to concluding an international convention between 26 powers for the regulation of whaling, which became effective in 1935. While the regulations under this convention have afforded whales much-needed protection, experience gained in recent years has indicated

that additional regulatory measures are needed. To accomplish this an international agreement for the further regulation of whaling was signed in London on June 8, 1937, on behalf of the Argentine Republic, Commonwealth of Australia, Germany, the Irish Free State, New Zealand, Norway, the Union of South Africa, the United Kingdom of Great Britain and Northern Ireland, and the United States of America. The agreement will become effective when ratified by a majority of the signatory Governments, among which must be the ratifications of Germany, Norway, and the United Kingdom. Up to Dec. 15, 1937, these three countries and the United States have ratified the agreement.

**Flagstad, Kirsten** (1895- ), Norwegian opera and concert singer, was born in Hamar, Norway. At the age of eighteen she sang as Nuri in D'Albert's *Tiefland*. Her debut was so successful that she was sent to Stockholm for study. There followed years in the Oslo and Gothenberg operas; and then, with her marriage, came several years of retirement. In 1933 she sang at the Wagnerian festival in Bayreuth. This led to her engagement in the Metropolitan Opera, New York, and her debut there, Feb. 2, 1935, as Sieglinde in *Die Walküre*. Her success at the Metropolitan, in London, and elsewhere has been remarkable, and she has been hailed as one of the great Wagnerian singers.

**Flandin, Pierre Etienne** (1889- ), French advocate and Republican deputy for the Yonne department; was under-secretary of state for air in 1920, minister of commerce in 1924 and 1929-30, of finance 1931-32, and of public works in 1934, on Nov. 8 of which year he became premier. Refused the special powers he sought to combat the financial crisis in May 1935, he resigned, and served as minister of State in succeeding cabinets until the formation of the Blum Government in 1936, since when he has not held cabinet office.

**Flax:** see LINEN AND FLAX.

**Floods and Flood Control.** The land surface of the earth is in a state of continual change: it is slowly, constantly, being elevated by geological forces and as slowly and inevitably being eroded and leveled by the action of water. Water falls as rain or snow, a large portion of which runs off the land as rivulets and creeks which later unite to form a river. On the higher elevation the river cuts a deep channel which is more than capable of caring for the maximum flow of water, as, for example, the Grand Canyon of the Colorado river. When the river reaches the lowlands it becomes sluggish and meanders over wide areas so that the channel cut by the river is not deep enough to take care of the maximum flow of water. Consequently, when heavy rains or snows occur on the watershed of the river, floods inevitably must occur in the lowlands of the valley.

Floods of this type occur on various portions of the earth's surface wherever similar geographical and climatic conditions prevail, such as on the Mississippi, the Hwang-Ho or Yellow river, the Ganges and the Nile. Such floods are caused by climatic conditions over which man has little or no control. They are largely seasonal and have occurred and are apt to occur at any time on the lowlands of such large rivers whenever the rainy season commences. For example, heavy tropical rains occur on

A CHAIN GANG from the Shelby County, Tennessee, Penal Farm carrying sand bags to reinforce Mississippi river levees during the disastrous flood of 1937

the headwaters of the Nile river in April and May, causing rise in the river often as much as three feet per day. The resulting flood stage invariably reaches a maximum at Assuan early in September.

Since the alluvial valley of the Mississippi has been formed by the flood waters carrying the silt from the higher elevations, floods must have always occurred on the Mississippi. From 1785 to 1930, thirty major floods have been recorded. Whenever the gauge at Cairo, Ill., reaches fifty feet there is danger of a disastrous flood in the lowlands. During the past seventy years the river has risen above this point exactly twelve times, in 1862, 1867, 1882, 1883, 1884, 1886, 1897, 1899, 1907, 1912, 1913 and 1937. Floods also occur due to unusual circumstances such as the breaking of dams constructed for impounding water or to so-called cloudbursts. The Johnstown flood in Pennsylvania in 1889 is of this type.

**Methods of Flood Control.**—A number of theories have been advanced for the control of floods such as the construction of levees, establishment of spillways, construction of reservoirs, reforestation, terracing cultivated soil and the creation of floodways to care for the river at flood time.

Since the water of a river near its edge runs slower than it does in the centre, it naturally deposits its silt and mud to form banks. The banks of the river in a low valley therefore are higher at the river's edge and slope away from it.

The inhabitants of a region adjacent to a river menaced by floods early sought to protect their homes, property and lives by strengthening these banks, making them higher and stronger. The theory being that if these levees were constructed high and strong enough they would confine the river and cause it to construct a channel by scouring which would be deep enough to care for the maximum flow of the river at flood time. For forty centuries the Chinese have been trying to control the Hwang-Ho in this manner. The levees have been built higher and higher throughout the centuries. But the river bed does not scour; it slowly rises a foot a century until today the bottom of the river, confined by levees, is twenty feet above the surrounding country. When the levees break as they do in time of flood, the terror, suffering and desolation on the lower plains are inconceivable. The establishment of reservoirs on the headwater of the various streams which make the main river would be of immeasurable value in flood control but the cost would be very large.

It is true that the accepted method of crop production on the uplands by breaking up the sod and the production of only cultivated crops promotes soil erosion and decreases the water holding power of the soil. The same thing is true when the primeval forest is destroyed and the protecting vegetation thus removed. Soil erosion under these conditions takes place more rapidly. More water escapes to the river and the soil debris is deposited in the river channel in the lowlands, thus increasing the damage from floods. Reforestation and improved soil management are vital problems as methods of flood control, and their wide adoption would have a pronounced influence on the prevailing state of the agricultural and lumbering industries. The correct solution of the problems presented by floods can only be obtained by a full and scientific understanding of all the contributing causes of flood disasters. Floods, however, occurred on the Mississippi river long before white men settled in the Mississippi valley or had removed the protecting tree and sod cover of the timbered watershed or sod bound prairie. When De Soto visited the Mississippi in 1543 long before the watershed had been in any way affected by man, he found it in flood stage. If the account of the historian of this expedition can be relied upon, this flood was probably as severe as any which have since occurred. The statement that "The Mississippi flood is a man made disaster," is therefore inaccurate. It is true that the destruction of the protective forest and native sod by man has in many cases accelerated the rapidity of the flood waters and thereby has increased the damage done by floods. It is also true that modern civilized man has built villages, towns and cities in the lower lying flood plain where damage and destruction of life and property must result whenever flood conditions prevail.

The fourth theory for controlling floods is by the creation of a floodway to accommodate the maximum flood. In a state of nature the river naturally spills over its banks at certain points. The advocates of this theory of control would permit and cause the river to spill over at certain points and flood a confined portion of the surrounding country. In effect, the river would be widened at certain points to care for the flood and a certain portion of the surrounding country deliberately sacrificed to protect the remainder.

There is little new, except as to magnitude, in modern methods of flood control as the methods now advocated were practiced as well by ancient and mediaeval peoples. Levees have been con-

structed on the Yellow river for thousands of years until today the bottom of the river is twenty feet above the level of the surrounding country. Ruins of terraces in South America have recently been discovered which antedate the Inca civilization. Floodways have been used by the Egyptian people on the Nile river for thousands of years. The prevailing notion that "levees only" will solve the problem of flood control is not true. The Chinese built bigger and better levees on the Hwang-Ho for four thousand years without securing such protection. Levees, spillways, floodways and reservoirs must all be used. But reforestation and a decided change in agricultural practice of the farm lands in the valley must take place if for example the Mississippi is not to become "The Sorrow of America." (Ro. St.)

The year 1937 was marked by several severe floods. The Thames caused considerable damage in London and its vicinity in late January; but far more disastrous was the Ohio flood of the same month which reached record heights, destroyed half a billion dollars worth of property and cost over 900 lives. Only mobilization of relief workers and the advanced warning to Mississippi cities prevented damage in lower sections of the system from approaching the havoc in Louisville and Cincinnati. During March towns to the north of London suffered from heavy rains along the Ouse. The following month London, Ont., Pittsburgh and Johnstown, Pa., Wheeling, W.Va., and Cumberland, Md. were severely hit; while such scattered regions as Alaska, Bulgaria, Burma, Chile, Ecuador, Korea and Poland reported disasters in the early summer. As usual few crises arose during the late summer and fall. (See also LIBRARIES: *Flood Damage*; MISSISSIPPI RIVER SYSTEM.)

**Floors:** see INTERIOR DECORATION: *Floors*.

**Florida**, extreme south-eastern State of the United States, is called the "Peninsula State" because of its peculiar outline. Its coast line is greater than that of any other State, extending 472mi. along the Atlantic and 674mi. along the Gulf of Mexico. Its total area is 58,666 sq.mi., of which 3,805 sq.mi. are water surface. Florida contains about 30,000 lakes, many of them connected by subterranean channels. Population (U.S. census, 1930) 1,468,211; (State census, 1935) 1,606,842; (Federal estimate, July 1, 1937) 1,670,000. Of the 1935 population 1,139,063 were white and 463,205 coloured; 989,743 were urban and 613,972 rural. Only about 45,000 were foreign born. The largest cities were Jacksonville, Miami and Tampa, with populations of 146,289, 127,600 and 100,151 respectively, and Tallahassee, the capital, had 11,725.

**History.**—The most significant recent developments in Florida government were the adoption of a constitutional amendment (1935) exempting homesteads up to \$5,000.00 value from *ad valorem* taxes and more recently of an amendment allowing the State to participate in the Federal Government's Social Security program. The congressional re-apportionment, which followed the 1930 decennial census gave Florida a fifth Representative in Congress. The present State elective administrative officers, whose terms expire in Jan. 1941, are Fred P. Cone, governor;

FRED P. CONE, governor of Florida

R. A. Gray, secretary of State; Cary D. Landis, attorney-general; J. M. Lee, comptroller; W. V. Knott, State treasurer; Colin English, superintendent of public instruction; and Nathan Mayo, commissioner of agriculture.

**Education.**—At the head of the State school system is the superintendent of public instruction. The school revenue is derived from a permanent school fund, special State and county taxes, the one-mill *ad valorem* tax and legislative appropriation on the teacher-pulpit-unit basis, which yielded \$11,323,249.52 for the fiscal year, June 1936–June 1937. State appropriations for higher education amounted to \$6,683,916.75. During the last decade the enrolment of the higher institutions of learning rose rapidly. Nearly 3,200 students are now enrolled at the University of Florida and around 1,800 in the Florida State College for Women. The number of children, according to the last report of the State superintendent, in the public schools was 305,355, of which 217,054 were in schools for whites and 88,301 were in coloured schools.

**Charities and Correction.**—Since 1923, when the convict lease system was prohibited by law, the State prisoners are kept at the State prison farm or are worked on the State highways or in a few of the other State-maintained institutions. Florida maintains two reformatories, an Industrial School for Boys at Marianna and an Industrial School for Girls at Ocala. The Florida Farm Colony (for feeble-minded) is located at Gainesville and there is a Hospital for the Insane at Chattahoochee. Among the noteworthy private charities is the Children's Home Society.

**Banking and Finance.**—The last available figures on the State's financial condition, taken from the report of the State treasurer for the fiscal year ending June 30, 1936, show a total balance in the treasury of \$19,023,010.45. The total bank deposits in Florida national and State banks March 1937 were \$295,390,000.

**Agriculture, Manufactures and Minerals.**—Agriculture is the most important industry of the State. In 1935, there were 72,857 farms with a total acreage of 6,048,406, of which 1,142,767 were in crops, 489,006 were idle (fallow), 2,362,674 were in pasture, 1,140,941 were in farm woodland and the rest mainly in fruit. The crops valued at over \$5,000,000 for the 1937–38 season were:

	Acres	Production	Value
Oranges (including Tangerines) . . . . .	..	24,000,000 boxes	\$35,385,000
Grapefruit . . . . .	..	13,000,000 boxes	11,650,000
Tomatoes . . . . .	32,500	2,746,000 bu.	7,587,000
Snap beans . . . . .	58,800	4,688,000 bu.	7,037,000
Corn (Maize) . . . . .	789,000	7,890,000 bu.	5,760,000
Irish potatoes . . . . .	34,000	4,114,000 bu.	5,348,000

The production and marketing of live stock is also important. On Jan. 1, 1937, the live stock resources of the State were: 681,000 cattle, 115,000 milch cows, 499,000 swine, 38,000 sheep, 18,000 horses, and 41,000 mules.

The more important manufactures of the State were lumber, naval stores (turpentine and rosin) and cigars. In the 12 months season April 1936 to March 1937 Florida produced 6,200,000gals. of gum turpentine valued at \$2,380,000 and 355,000bbls. of rosin valued at \$4,070,000. Her 1937 lumber output was 600,701,000 bd.ft., mainly cypress and yellow pine, representing a value of nearly \$19,000,000. The cigars manufactured yearly in Florida represent approximately \$20,000,000. Two comparatively recent industries are the growing of tung nuts and the production from them of tung oil and the making of paper from pine pulp.

The State has only limited resources in minerals, the more important of which are phosphates, lime, limestone, kaolin and fuller's earth. The value of the phosphates produced in 1937 was around \$3,400,000.

An important asset is the annual tourist trade, amounting to about \$40,000,000 expenditure in the State during the 1936-37 season. (J. M. L.)

**Florida Ship Canal.** This impressive engineering project was included in the recovery program of President Roosevelt. It consists of a maritime waterway from Jacksonville on the Atlantic across Florida to Port Inglis on the Gulf of Mexico. From deep water to deep water, the canal would be 195 miles long, and for about half this distance, the route would follow the St. John's river and other natural waters. The total cost, necessarily speculative, was put at \$147,000,000. Ships using the canal would make the transit in 25 hours and would save  $2\frac{1}{2}$  days of voyage around the peninsula and corresponding costs, estimated according to present trade at \$7,500,000 annually.

The project has been criticized. Seaports south of the canal—for instance, Titusville, Palm Beach, Miami and Tampa—might suffer from the competition of the canal, and on geological grounds, the canal is opposed as “a drainage ditch” which would affect the subterranean waters of an aqueous territory so imperilling the growth of citrous and other vegetable products as well as the water supply of municipalities. An initial allotment of \$5,000,000 was approved by President Roosevelt on Sept. 3, 1935, but in 1936 Congress refused to provide further funds for the enterprise and work was interrupted.

**Flour and Flour Milling.** A demand for richer breads has encouraged a tendency toward slightly creamier flour types. Although colour is still an important quality factor, a dead-white flour is no longer considered a necessity, and the newer flour grades have reflected a disposition on the part of the baker to be better satisfied with a slightly creamy, more natural flour tint.

The tendency toward a slightly higher protein in the flour of recent crops is probably due to favourable growing conditions. Since environment at the critical stages of growth, particularly moisture and fertilization, has a great influence upon wheat composition, the seasonable variations in flour quality may be considerable, especially where wheat blending is not practised. Such variations should not be considered as important trends in the milling industry as a whole.

Enzymatically, there is no great difference in flour quality, although some millers have succeeded in developing the natural diastase of wheat by controlling the “tempering” conditions of wheat so as to maintain an atmosphere favourable to enzymic activity.

**Milling Practice.**—Flour blending has not only been practised by most of the successful bakers, but also by many of the better millers. Since scientifically controlled wheat blending usually precedes the milling of flour, the ultimate baked product in most instances represents a wide variety of wheats from several different growing sections. These repeated blending operations, based upon the results of chemical analyses and scientific baking tests, go far toward insuring uniform quality in the various flour grades.

Adequate elevator capacity, with dependable laboratory facilities, have been vital factors in securing uniformity in the characteristics of any given grade or type of flour. Without ample storage capacity and a means of quickly and accurately determining the quality differences in the incoming cars of wheat during the harvest season, it is impossible to separate the various wheat types in such a manner that the quality of the flour may be controlled within the quality limitations of the desired grade.

While ultraviolet irradiation for the purpose of vitamin production has become established to a certain degree in the field of cereal foods, it has yet to become practical in the milling

industry. In view of the growing interest in vitamins as a nutritional necessity such a development may be looked upon as a future possibility.

Wheat germ oil, until recently a laboratory curiosity, has become recognized as an extremely rich source of vitamins B and E. A few of the larger millers have taken steps to separate the wheat germ from their feed house streams, and have found a profitable market for the processed germ as well as for the oil obtained therefrom. (H. E. BA.)

**Fluorspar.** The chief producers of fluorspar are the United States, Germany, the Soviet Union, and the United Kingdom, which account for about three-quarters of the total output; France was formerly an important producer, but has declined, while the Soviet Union has increased its output. A pre-depression total of about 400,000 metric tons declined to 122,000 tons in 1932, and has since recovered to about its former level. The United States produces about one-third of the world total, and imports enough more to bring the domestic consumption up to about one-half of the world supply. The iron and steel industry takes about 80% of the domestic consumption, while the manufacturers of glass and enamel, and of hydrofluoric acid and its derivatives account for 10% each; other uses are small. (G. A. Ro.)

**Food Prices:** *see* PRICES, STATISTICS OF.

**Foot-and-Mouth Disease:** *see* LIVESTOCK; SHEEP.

**Football.** Intercollegiate football is the atlas of college sport in the United States. Upon its broad base is reared the entire athletic structure, and without its large revenues retrenchments would have to be made that would seriously curtail, if not eliminate, activity in most of the other major and the minor branches of competition. Even so richly endowed a university as Harvard finds it necessary to saddle football with the burden of its athletic budget, though it looks forward to the day when it can conduct its sports independent of gate receipts.

Understanding the staggering financial load carried by football, running high up into six figures at many large educational centres, it can be grasped how popular is the game and how essential it is to have a winning team that will attract its share of the millions. During the period of the depression the profits from football fell off to an alarming degree, with the result that drastic revisions had to be made in the outlay of funds for the sports that are not self-supporting. The intercollegiate rowing regatta was called off one year, interrupting the sequence of one of the oldest and most famous of all the college fixtures.

During the past few years football has staged a steady recovery and directors of athletic set-ups, with their large overhead and interest and amortization obligations on stadia, are breathing more easily. This uptrend continued in 1937 and, despite the fact that discouraging weather conditions obtained persistently during the last half of the season, football patronage was back near the peak.

It is estimated that close to 20 million people attended the football games throughout the country. Notre Dame attracted more than 450,000 to its nine contests. Army and Navy played to 102,500 in Philadelphia, with rain falling, and the almost unbelievable total of 400,000 applications for tickets, at \$4.40 each, was received by the service academies. California and Stanford drew 85,000, and crowds of 70,000 were out on repeated occasions. As further indications of the recovery, the Yale Bowl was filled to its capacity of 72,000 for the first time since 1929 for the Dartmouth game and Harvard's Soldiers' Field drew its limit of

A LINE PLUNGE in the new football game played by six-man teams and said to be the fastest-growing scholastic sport in the U. S.

nearly 58,000 for the first time since 1931 for the meeting with Yale. A high school game in Chicago lured between 115,000 and 120,000 people, an unheard-of turnout for competition of the secondary class that is to be explained by the nation-wide fame accruing to a schoolboy player William De Correvont.

The teams that drew the biggest crowds were not necessarily the strongest. Neither Army nor Navy ranked with the leaders, and Notre Dame was beaten twice. However, the elevens that had the best records on the field did not lack for patronage.

The foremost teams of the season, as ranked in a nation-wide poll of sports writers, were Pittsburgh, California, Fordham and Alabama, in that order. California was hailed as a "Wonder Team" and gave demonstrations of tremendous running power against its strong rivals with the exception of Washington, which held it to a scoreless tie. But, despite the awe in which the Golden Bears were held, Pittsburgh was the definite choice as the No. 1 team of the year. The Panthers had one of the most difficult schedules of the season and defeated all opponents with the exception of Fordham. Fordham, rated by many as the strongest defensive eleven in the country, held Pittsburgh to a scoreless draw for the third successive year and came out on top in all its other contests.

A CENTRE, two ends and three backs line up in the new football of six-man teams, now played in 700 schools in the United States

Alabama was the only one of the four to win all of its games and was invited by California to be its opponent in the Rose Bowl fixture at Pasadena on New Year's Day. The invitation went forward to Alabama after the Pittsburgh players had voted themselves out of the running with Fordham hopeful of getting the call. The California team won by a score of thirteen to nothing.

The Sugar Bowl game in New Orleans presented Louisiana State and Santa Clara and resulted in a victory for Santa Clara of six to nothing. Santa Clara was one of the few major teams to win all of their games. The only others were Alabama, Colorado, and Lafayette. Lafayette, under its new head coach, E. E. (Hooks) Mylin, was the surprise team of the East after losing seven games in 1936. The East had an unusually large quota of unbeaten major teams. In addition to Pittsburgh, Fordham, and Lafayette, Dartmouth, Villanova, and Holy Cross also escaped defeat, though all were tied.

Sectional honours went as follows: Pittsburgh was rated the No. 1 team of the East (as well as of the country), with Fordham ranked a close second and Dartmouth and Villanova next in order. Yale, Harvard, and Cornell had strong teams although beaten. The Big Ten championship was won by the formerly invincible Minnesota team, whose defeat by Nebraska, the Big Six champions, was one of the real surprises of the season and which lost also to Notre Dame. California won the Pacific Coast Conference honours. Alabama led the South-east Conference, with Louisiana State losing out through its 7-6 defeat by Vanderbilt. Rice, after a discouraging start, won the South-eastern Conference title. North Carolina ousted Duke as the leader of the Southern Conference, and Colorado won the Rocky Mountain championship. Byron (Whizzer) White of Colorado was one of the most famous players of the year, but the highest individual honours went to Yale's Captain Clinton Frank of Evanston, Ill. Frank was awarded the John W. Heisman Memorial Trophy as the outstanding player of 1937.

The style of play in 1937 was featured by one marked trend. The use of the five-man line, confined largely to the South-west heretofore, was extensively adopted in the East, with Yale starting the vogue. As a consequence, the outcry was heard that the defence, with its changing set-up from a six to a seven or five-man line, had too big an advantage over the attack, throwing its blocking assignments into confusion. The Harvard style of attack, with its adaptation of the deception and faking of the double wing to the single wing, was acclaimed as the best of the year and as the model to set the fashion in the East in 1938.

Professional football enjoyed its best season in the 16 years' history of the National Football League. Part of the credit for the boom was given to "Slingin' Sammy" Baugh, who led the Washington Redskins, transferred from Boston, to the National championship. Baugh's passing against the New York Giants in the Eastern final and against the Chicago Bears in the play-off for the National title won him wide recognition as the best passer football has seen.

Many followers of football would like to see the colleges follow the example of the professionals in putting the goal posts on the goal lines and permitting forward passing from any point behind the line of scrimmage.

**Canada.**—In Canada, where many of the features of the United States game have been adopted, with great stress given to the forward pass in recent years, football also enjoyed a lively season. Canadians' thoughts naturally turn to ice hockey in the fall and nothing can displace this game in their favour, but football is taking hold more and more.

Kicking, which plays second fiddle to running and passing in the American college game, is of paramount importance in the Dominion brand of football, both as an offensive and defensive

weapon. The success of the Toronto Argonauts bears this out. With three outstanding punters in Isbister, Selkirk, and West, the Argonauts, whose running attack was largely centred in an end sweep featuring long laterals, defeated rivals that had greater running and passing strength to win the Canadian championship. They won the Big Four title by defeating the Ottawa Rough Riders and in the Eastern final eliminated the Sarnia Imperials. Then came the Dominion final with the Western champions, the Winnipeg Blue Bombers. Toronto won on Selkirk's field goal to become the National champions. (A. D.A.)

**Great Britain.**—*The Rugby Union Game.* The season that ended in April of 1937 saw England win the international championship, beating all the other three countries. But never has the championship been won by such a narrow margin, or, as some would say, by a luckier side! Wales was beaten at Twickenham by a dropped goal to a try (4 points to 3), Ireland was beaten at Twickenham by a penalty goal and two tries to a goal and a try (9 points to 8), and Scotland was beaten in Edinburgh by two tries to a penalty goal (6 points to 3). Thus in three games England scored in all only 5 points more than their opponents. The English side reserved their best display for the Calcutta Cup match—that against Scotland, in which England not only won the Cup and the championship (for this is the last of the internationals), but won for the first time on the Murrayfield ground. This ground was opened in 1925, and England had never won there before, though they had tried to do so six previous occasions. England was the last of the home countries to win there. H. G. Owen Smith, equally well-known as a South African and Oxford cricketer, captained the England side, and played brilliantly at fullback. There have been few finer athletes in recent years than Owen Smith, who was a first-class Rugby footballer and cricketer, a splendid boxer, and kept goal for his hospital (St. Mary's), in the Hospitals Association final.

Ireland came next in the table (they probably had the best side of the lot!), with Scotland next, and Wales last. Wales lost all her matches, though it should be borne in mind that the two best players in the Rugby world, Cliff Jones and Wilfred Wooller, were not much use to Wales, Jones being unfit to play at all, and Wooller never being really fit. The international football was not of a very high standard, though there was one superb match—the one between England and Ireland at Twickenham, where G. J. Morgan, the Irish captain, and F. G. Moran, the right wing, played very well indeed.

Gloucestershire won the county championship, beating the East Midlands in the final. This was their ninth win, and they are now level with Yorkshire in the number of wins. But Gloucestershire was lucky to get past the semi-final. There they beat Kent at Gloucester by a dropped goal to a try (4 points to 3).

A very strong Army side won the inter-Services tournament, beating the Royal Navy and the Royal Air Force fairly easily. There were seven Internationals in the side, among them E. J. Unwin and R. Leyland in the three-quarter line, and G. J. Dean and F. J. Reynolds as halfback. The Hospitals Cup was won by St. Mary's, with a very fine side that included Owen Smith. They beat Guy's in the final by 11 points to 8.

The season that started in the autumn of 1937 was memorable in its first half for two things in particular—the retirement from the chairmanship of the English selection committee of John Daniell, and the magnificent victory of Oxford over Cambridge. John Daniell had been a selector for over 20 years, and everyone hopes that, after a little rest, he will resume the splendid work he was doing for the game. When John Brett (Durham and St. Edmund Hall) led his Oxford side on the field on Dec. 7 against the potentially brilliant Cambridge side, led by J. D. Law (Dover and Jesus), only the most ardent Oxonian thought that Oxford

had the remotest chance of winning. But some splendid tackling by H. D. Freakes, who came up from fullback to centre three-quarter for the occasion, and M. M. Walford, and splendid leadership of his forwards by Brett, with P. K. Mayhew helping him well, put the Cambridge backs completely off their game, and Oxford won easily by a goal and four tries to a dropped goal (17 points to 4). His Majesty the King was present at the match.

**Rugby League Football.**—This professional form of Rugby football is now practically confined to Yorkshire and Lancashire. Actually amateurs are allowed to take part but, as in professional Association, by far the bulk of the players are professionals. The attempt to establish the game in London failed, and at the beginning of the 1937–38 season, the remaining London club was disbanded. The rules are slightly different from those prevailing in Rugby Union football, and there are only 13 players on each side. In the all-Yorkshire semi-final of the Challenge Cup, between Wakefield Trinity and Keighley at Headingley, at the end of last season, there were 40,000 present, a record for any Rugby League match in Yorkshire. This particular game ended in a draw, with no score, and in the replay Keighley won by 5 points to nil. They went on to play Widnes in the final at Wembley, but they were well beaten there by 18 points to 5. In the League table, Salford was top, Warrington, Leeds, and Liverpool Stanley coming next in that order. These four then had a knock-out competition for the championship, which Salford won, beating Warrington in the final by 13 points to 11.

In the first half of the 1937–38 season, Warrington did well again, but Yorkshire clubs were bunched at the top in greater numbers than usual. An Australian Rugby League side toured the country during that time, but did not do very well.

**Association Football.**—There were some interesting individual records achieved in the season 1936–37. W. R. Dean, the Everton and England centre forward, broke a record that had long been held by Steve Bloomer, that of scoring the greatest number of goals in League football. Bloomer's total stood at 352; but 36 more by Dean during the past season brought his total to 375, and he looks fit for many goals yet. Still, he has some distance to go to equal the record of James McGrory (Celtic), who is still playing well, and whose total at the same date was 405. The game lost some great men in 1937. That superb outside forward, subsequently a director of his club, W. I. Bassett of West Bromwich Albion, died on the eve of his club's visit to London to play Preston North End in the semi-final of the F. A. Cup. Perhaps it was not surprising that the Albion lost badly. "Billy" Bassett was a great little man, on the field and off. Sir Charles Clegg, Mr. Arthur Kingscott, and other famous administrators died the same year. Sir Charles played in the first international match between England and Scotland (in 1872), and was connected with the Football Association from 1886 till his death, having been chairman from 1890 till 1923, and from then on president. He was knighted for his services to football in 1927. Mr. Kingscott was a former honorary treasurer of the F. A.

Playing splendid football with a well-balanced side, Manchester City headed the League table, Charlton Athletic coming next, and Arsenal third. Strangely enough, the other Manchester club, Manchester United, was practically bottom of the table, Sheffield Wednesday being the only club below them. Manchester City's goal record was easily the best in the table. They scored 107 goals, whereas the runners-up scored only 58 in the 42 matches. It is doubtful whether there has ever been such a disparity between the first and second clubs before. No one likes to see Aston Villa in the second division—it seems all wrong, even though other famous clubs like Blackburn Rovers and Sheffield United are there as well. It was hoped that they would get back straight away to the first division; but they had to be content with ninth position,

Sheffield United being seventh, and Blackburn Rovers twelfth. Leicester City were top, and they, with Blackpool, were promoted at the end of the season. The F. A. Cup final, played as usual at the Imperial stadium, Wembley, was won by Sunderland, who beat Preston North End rather more easily than a score of 3-1 would suggest. It seems almost incredible, for they have had a fine side for very many years now, but it was the first time that Sunderland had ever won the Cup. Even so, they all but had their usual luck in Cup matches, for it took them three games to dispose of Wolverhampton Wanderers in the sixth round. The Cup-winners in other countries were: Celtic (Scotland), Belfast Celtic (Irish F.A.), and Crewe Alexandra (Wales). There were record crowds at both Glasgow and Wembley, and the comparative figures are rather interesting. There were 146,000 people at Glasgow and they paid £12,248, and 93,000 at Wembley, who paid £24,831.

There is nothing like so much interest taken in Association football matches, except perhaps, in the England v. Scotland match, which was played at Glasgow last season before a record crowd of 149,547 spectators. Scotland won by 3 goals to 1. But Wales won the championship, beating all the other three countries. Scotland came next, then England, and finally Ireland, with three defeats. In the amateur internationals, Scotland won all her matches, England winning one only, that against Wales at Portsmouth, about which there was no mistake, for Wales was beaten by 9 goals to 1. During the summer, or rather in May, an English side toured Norway, Sweden, and Finland, and beat all these countries easily. Scotland found their task a much harder one in Austria and Czechoslovakia. Still, they managed to avoid defeat, drawing the game in Vienna and winning in Prague.

The season that started in the autumn of 1937 went off smoothly, with preparations being made for much rejoicing at the end of it, for 1937-38 is the jubilee season, the Football League having been formed in 1888 with 12 clubs. It is interesting to note that not one of these clubs has remained continuously in the first division. All have been relegated for long or short periods at some time or other. Perhaps the most interesting general feature of the league tables before Christmas was the fight Aston Villa were making in division II. At the turn of the year they displaced Coventry City at the top. The University match was won by Cambridge, again unexpected, though not anything like so unexpected as their defeat in the Rugby match. (D. R. G.)

**Foot, Arthur William** (1853-1937), American organist and composer. Born in Salem, Mass., March 5, 1853, he graduated from Harvard university in 1874 and studied at the New England Conservatory of Music. From 1878-1910, he was organist of the First Unitarian Church of Boston. He was one of the founders of the American Guild of Organists and was elected a member of the National Institute of Arts and Letters in 1899. Among his compositions were the symphonic prologue *Francesca da Rimini*, the overture *In the Mountains*, and the suite *Four Character Pieces after Omar Khayyam*. His most famous song was *The Night Has a Thousand Eyes*. He set music to Longfellow's poems, "The Wreck of the *Esperus*," "The Farewell of Hiawatha," and "The Skeleton in Armour." He died in Boston, April 9, 1937.

**Foot Racing:** see TRACK AND FIELD SPORTS.

**Forbes-Robertson, Sir Johnston** (1853-1937), English actor; born in London, Jan. 16, 1853; died at Dover, Nov. 6, 1937. For details of his stage career see *Encyclopædia Britannica*, vol. 9, p. 490. Sir Johnston's final retirement from his profession in 1915 had the distinction of being really final, for any subsequent appear-

THE TELESCOPIC LENS catches a spectacular detail of football as a Pennsylvania player upsets a member of the Columbia team

ance of his was purely voluntary and given for purposes of charity. The chief of these voluntary appearances was in *The Passing of the Third Floor Back*, which ran for some months in 1917 for the benefit of War charities. The very high esteem in which Sir Johnston was held by the theatre-going public was due, perhaps more than to any other quality, to his remarkable physical advantages, including the great beauty of his voice. It was inevitable that he should have been a member of the British Broadcasting Corporation's advisory committee on spoken English.

**Foreign Exchange:** see EXCHANGE RATES.

**Foreign Missions.** For the foreign missions of the Protestant Churches of the United States the year 1937 has been chiefly characterized by two tendencies and one major crisis. The first tendency has been toward a recovery in income. The decline in giving which began about

TWO RANKING U. S. football teams, Pittsburgh and Fordham, might not have played a scoreless, tie game, but for illegal blocking (left) that nullified a touchdown by Goldberg (upper right) of Pittsburgh

1925 as a reaction against the forced expansion of the first years after the World War and which was accentuated by the financial depression commencing in 1929 has halted. While, with declining interest rates, income from endowments has not come back to earlier levels, gifts from living donors have substantially increased. As a result, the reduction in missionary staffs has been slowed down and here and there a few re-enforcements have been sent out. A second tendency has been toward an adjustment of the policies of mission boards to the new conditions in the midst of which foreign missions are compelled to operate. The adjustment is by no means completed, but it is being made. It has been furthered by the preparation for the meeting of the International Missionary Council at Madras, India, to be held in December 1938. The major crisis has been brought by the hostilities between Japan and China. The attendant intensification of Japanese nationalism has made the work of the foreign missionary more difficult in Japan and Korea. In China the fighting has interrupted many of the normal activities of missionaries and churches. The Japanese victory is being followed by conditions very different from those under which Christian missions in China Proper have heretofore operated. Since the Far East is a region in which Americans predominate in Protestant missions, the crisis is bringing problems which are engaging much attention from American missionaries and mission boards.

Roman Catholic mission agencies in the United States have continued to send substantial numbers of recruits to their growing enterprises in the Far East. American Roman Catholic missions, even more than American Protestant missions, are concentrated in the Far East. The Chinese-Japanese crisis has, therefore, been disturbing.

(K. S. L.)

**Great Britain.**—In 1937, a centenary, a diamond jubilee, two golden jubilees, and a silver jubilee commemorated the birth of the Church of England in, respectively, Bombay, Uganda, Jerusalem, Japan, and China; in each case the church was revealed as no longer foreign to the countries of its adoption, for Chinese and Japanese bishops took part in the Far East celebrations, and at the Uganda Thanksgiving Service 60 African clergy were present; but, in spite of these encouraging signs of progress, the archbishop of Canterbury had to deplore in the autumn a shrinkage of the area of, and a serious shortage of recruits for, the mission field, as well as a diminution of the available funds.

Current contributions in the year 1936-37 (excluding legacies and income from endowments) from the churches of the Anglican Communion in the British Isles for the work of the church overseas amounted to £1,020,757. The average contributions for the years from 1931 to 1936 amounted to £1,022,376; the Church Missionary Society's receipts were £330,890, and those of the S.P.G. £197,630.

The overseas missions of the Methodist Church record another year of spiritual progress, and the Conference (at Bradford) rejoiced that the debt of £13,012 at the end of 1935 was completely cleared in 1936, due to some extent to retrenchment in the mission fields. The income of the Methodist Missionary Society from home sources was £331,380, as against £327,500 for the previous year.

From the British Isles the London Missionary Society received in 1936-37 £129,435 as against £133,100 in 1935-36. The total income from all sources was £344,116 as against £351,805, the excess of expenditure over income being £16,797. The Autumn Assembly of the Congregational Union held at Bristol in October devoted much time to the consideration of the L.M.S. crisis, viewing with deep concern the financial situation of its foreign missions and inaugurating a campaign of faith and renewed effort.

The Baptist Missionary Society had a total expenditure for 1936-37 (including all home expenditure) of £213,229, there being

a deficiency on the year's working of £4,070. The reports of most missionary societies showed reduced incomes and an inadequate supply of workers, but there was every evidence of successful campaigns, even in the troublous field of the Far East.

**Foreign Trade:** see BALANCE OF TRADE; INTERNATIONAL TRADE; SHIPPING, MERCHANT MARINE; TRADE AGREEMENTS.

**Forestry and Reforestation.** One-third of the continental land area of the United States is most valuable for forest purposes, and forests are still a major natural resource. Some 6,000,000 people get their daily bread from industries dependent on forest resources. Forest lands also provide worth-while work, non-competitive with industry, for millions who might otherwise be unemployed. Farm woodlots make up more than 17% of all farm lands. They furnish material and part-time incomes to 2,500,000 farmers. Forest lands help protect watersheds. They help prevent soil erosion and silting of reservoirs and ditches. They also help store water used for domestic and power purposes as well as for irrigation.

Forests help labour, agriculture and industry generally. Half the population of Flagstaff, Ariz., depends on forest products cropped from the Coconino National forest. Ponderosa pine harvested on Mount Harney, in South Dakota, contributes 20,000 man-days of work each year to a nearby but scattered population. In certain Montana counties a \$55,000,000 investment and the livelihood of more than 5,000 people depend largely on planned use of National forest forage. From protected National forest slopes comes water for Los Angeles, Calif.; Portland, Ore.; Salt Lake city and Logan, Utah; Prescott, Ariz.; Denver, Colo. More than 30,000,000 people find health and happiness on National forest vacations each year. The money they spend helps support thousands of local communities. These are a few examples of localities and regions where jobs are steadier and industry and agriculture more secure because forests are treated as crops and forest-land resources renewed and maintained through use. On publicly owned National forests, forest resources are instruments for human welfare.

But of all U.S. commercial forest lands—those capable of growing marketable timber—only the poorest  $\frac{1}{3}$  is now publicly owned. The best  $\frac{2}{3}$  is in private ownership. On this land, with but minor exceptions, forest exploitation continues. And exploited forests are measured by more than billions of feet of timber gone, millions of devastated acres tax-delinquent, potential business lost. These are bad enough, but human exploitation—which follows forest exploitation—is worse.

Rural distressed regions are in general those in which forest exploitation has already taken its toll. They include 1,300 counties, half of all U.S. farms, nearly  $\frac{3}{4}$  of all farm tenants. The average farm holding is 87 acres. This compares with 222ac. in all other counties. Average value of land and buildings is \$1,995 per farm. This compares with \$7,659 in all other counties. The index of farm income is under 30. This compares with 90 to 120 in typical corn belt counties. And in these distressed regions large families are the rule, educational facilities are meagre, living standards are low, undernourishment is common. Sixty odd per cent of the land in these distressed regions is forest rather than cultivable land. Most of it has been exploited, but it is still capable of being rebuilt. This is significant, for although conditions and opportunities for early returns vary from locality to locality, most of these forest lands can ultimately be managed so they will produce continuous forest crops and more nearly normal standards of living. This can be accomplished through worth-while, publicly financed work. And this can, in the meantime, replace a publicly financed dole.

Many people still think of forest conservation as preservation, and advocate using substitutes for lumber. Yet lumber is but one product of wood, which is an abundant source of cellulose, turpentine, lignin, drugs, and chemicals. It makes rayon, paper, films, explosives, plastics, alcohols and acids, lacquers, food for cattle, gas for automobiles. It can make adhesives, artificial wool, human food in certain forms. What it may make depends largely on research and man's ingenuity. Synthetic rubber, from by-products of wood, is chemically possible. Add to all these things the influence forests have on agriculture and commerce, and the need to protect and conserve the cultural and inspirational values forests have, and it becomes evident that a nation cannot afford an economy of scarcity with respect to forests.

Many people also think of forest conservation as supplying huge jobs for preventing and suppressing forest fires, and for reforesting millions of acres with billions of little trees. Both these jobs are important. Since 1935 more than 44,000,000 trees have been planted on the Prairie States Planting Project. In 1936 more than 35,000,000 trees were produced and distributed by States in co-operation with the Federal Government. Approved annual output for National forest nurseries for 1936 exceeded 255,000,000 trees, and the area reforested was greater than in any previous year. But National forests alone now include some 4,000,000ac. that need reforesting, and the area in private ownership is much greater.

In 1910 nearly 5,000,000 National forest acres were burned over. Damage to tangible values was in excess of \$24,000,000. Forest fire control as a science began then, and since then real progress has been made. In the half decade 1910-14, the average number of National forest acres burned per 1,000ac. protected was 7.2. Average reduction since then has been 27% for each half decade. For the seasons of 1935-36 it was only 1.6. But there were more than 16,800 fires on the National forests in 1936, and man caused almost 70% of them. With State and Federal co-operation more private forest lands now receive better protection, but it was not so long ago that fires on those lands burned each year an empire greater than all of Maryland, Connecticut, Massachusetts, Rhode Island, New Jersey, and New Hampshire combined.

Forest conservation includes reforestation, fire protection, and forest preservation, but it is far broader. It has to do with trees, yet as a public policy it considers that the true function of trees is to add continuously to the security and welfare of the people of a nation. To accomplish this, Congress established a National Forest system in 1891. The wisdom of and necessity for public ownership and management of forest lands on an even larger scale has since been demonstrated. Public responsibilities with respect to privately owned forest lands, and Federal and State co-operation with private owners, are also established. With safeguards to insure adequate participation by private owners, public aid in such things as protection from fire, insects and diseases, and in forest research, should be continued and increased.

But 70% of U.S. forest land is privately owned. Here forest exploitation is still practiced generally. Human exploitation is still its aftermath. And—with individual exceptions that are pitifully few—nowhere has private initiative established that cropping practice which, basic to forest conservation, brings security to labour and agriculture and industry. Ex-

perience shows that public regulation of private forest lands is necessary. Such regulation protects vital public interests. It also protects private owners who recognize social obligations inherent in forest-land management from those who might otherwise continue ruthless exploitation. With extension of public ownership of forest lands, with more and better public co-operation with private owners, and with public regulation of forest lands in private ownership, forest conservation will in practice as well as in theory mean human conservation. (F. A. S.)

**Great Britain and Europe.**—Recent silvicultural developments have taken place in two main directions: (1) afforestation, to increase the area under forest, (2) measures for increasing the productivity of existing forests. The Italian Government has been afforesting over 20,000ac. a year, chiefly on denuded mountain

STARTING A BACKFIRE to stop an approaching forest fire by burning all inflammable material in its path

slopes. Great Britain, under a State afforestation scheme, has planted an area of over 111,000ac. between 1920 and 1936; the normal program of 20,000ac. has recently been increased to 30,000ac. a year. The Irish Free State has afforested 57,000ac. since 1931. The French Senate has approved an extensive scheme of afforestation of idle lands, with the aid of Government loans. In Czechoslovakia, Hungary, and other European countries, considerable areas of bare land have been planted up during recent years. Among non-European countries, New Zealand, South Africa, and Australia have carried out large planting programs through State and private agency. In New Zealand alone, about 720,000ac. of exotic plantations have been formed up to date; of these, 406,000ac. are State and 314,000ac. private. Japan can show a larger area of artificial forests than any other country in the world. During the last 45 years the area afforested by State, private, and other agencies amounts to nearly 8,000,000 acres.

Steps are being taken to increase the productivity and out-turn of existing forests, and to develop further forest areas. Germany, in her efforts to become self-supporting, has increased the annual cut of all forests over 125ac. by 50%, and is exercising a stricter control over private forests than formerly. Russia is opening up new areas to regular working, especially in Siberia; an increased timber output of 30% was planned for 1937. In the tropics, considerable advance is noticeable in methods of natural and artificial regeneration designed to improve the productivity of the forests. The system of *taungya* plantations, formed with the aid of shifting

OWNERSHIP of the 494,898,000 acres of commercial forest area of the United States

A TYPICAL LOOKOUT STATION, from which forest rangers keep constant watch for fires over hundreds of miles of forests

cultivation, and originally developed in Burma, has been extended to many parts of the tropics.

In Europe, the artificial creation of extensive stands of conifers outside their natural habitat has in some places resulted in serious insect and fungus attacks. This has led to a movement aiming at more natural methods of silviculture, which started in the latter part of the last century, but is largely a post-war development. The main object is to keep forests in a healthy condition and so increase the out-turn of timber of good quality. Clear-cutting and replanting are being abandoned in favour of "continuous forest" shelter-wood systems with natural regeneration, and mixtures are being increasingly employed in preference to pure stands. In Germany this idea has had its latest exposition by Heske and Rubner under the title *Vorratswirtschaft* (growing stock management), under which the aim is not to secure the maximum immediate profit in the working of a forest, but to concentrate attention on maintaining the optimum soil conditions and growing stock in order to bring the highest ultimate return.

Recovery from the recent world economic depression has been reflected in the increased utilization of wood, partly stimulated by the shortage of steel. The use of "composite wood," in the form of plywood, laminated boards, block boards, and fibrous boards, is on the increase. In heavy constructional work—bridges, roof trusses, etc.—the use of composite wood has been greatly extended by improvements in methods of manufacture, in glues, and in joints and fastenings, while plywood faced with metal is now commonly used in aircraft construction and domestic fittings. The pulpwood industry has likewise shown great development. In European countries material formerly used as pitwood is being increasingly used as pulpwood. Russia is starting to build large pulp mills in order to export pulp instead of pulpwood. In Australia, research into the paper-making properties of hardwoods is in progress, while in Burma a scheme is on foot for the manufacture of paper-pulp from bamboos. Attention is being devoted, in France and Germany, to the use of wood and charcoal as fuel for motive power, and during the past ten years there has been a notable increase in the efficiency of producer-gas engines, not only for stationary power-plant, but also for road vehicles. (See also AGRICULTURE: *Land Planning*.)

Rubner, *Die Vorratswirtschaft*, Pt. I (Berlin, 1936); R. N. Chrystal, *Insects of the British Woodlands* (London, 1937). (R. S. Tr.)

**Formosa** (TAIWAN), a large island in the Western Pacific, between the East and South China seas, bisected by the Tropic of Cancer; area 13,429 sq.mi.; capital, Taihoku; population (1935) 5,315,642, mainly Chinese. Formosa has been part of the Japanese Empire since 1895, when it was conquered from China. Part of the island was under Dutch rule from 1624 until 1662; and remains of forts and other Dutch buildings are still to be found in the southern part of the island, in the vicinity of Tainan. Formosa is governed by a governor-general, assisted by an advisory Council, the majority of the members of which are Japanese. The present governor-general is Admiral Seizo Kobayashi. An important Japanese naval base, access to which is closely restricted, is at Mako, in the Pescadores, islands off the western coast of Formosa. The importance of the island as an aeroplane and naval base has been demonstrated during the hostilities with China. Formosa is, in proportion to its size, perhaps the richest of Japan's colonies. It has been intensively exploited, Japanese investment in the island being estimated at 400,000,000 yen (\$200,000,000 at pre-devaluation rates of exchange). Most of this capital has been invested in the sugar industry. Many of Japan's needs—sugar, bananas, pineapples, citrus fruits—are largely or entirely supplied from Formosa, which is also a large producer of rice and the world's largest source of natural camphor. In 1936 Japan received over 90% of Formosa's exports and supplied over 80% of its imports.

English channel and the North sea to the north. Capital: Paris. President: M. Lebrun. National flag: blue, white, and red in equal vertical stripes.

**Area and Population.**—Area: 212,736 sq.mi. On March 9, 1931, the population of France was 41,928,851. On March 8, 1936, it was 42,013,506, an increase of 84,655 in five years. The population is 48.3% male, and 48.8% rural. In 1921, the rural population was 53.6%. The exodus from the country into the towns thus continues gradually. In France, Church and State are separated. The vast majority of the French population is Catholic. There are also about 1,000,000 Protestants and Jews. The language spoken by almost all French people is French. Here and there, however, dialects, such as Flemish, Alsatian, Provençal, Basque, Catalan, Breton, and Corsican are still in use. In certain villages of Lorraine, German is spoken.

There are 17 towns in France with populations of over 100,000 inhabitants: Paris, 2,829,746 (great Paris 4,962,967); Marseilles, 801,000; Lyons, 580,000; Bordeaux, 263,000; Nice, 220,000; Lille, 202,000; Toulouse, 195,000; St. Etienne, 191,000; Nantes, 187,000; Strasbourg, 181,000; Le Havre, 165,000; Toulon, 133,000; Rouen, 123,000; Nancy, 121,000; Roubaix, 117,000; Reims, 113,000; Clermont-Ferrand, 103,000.

**History.**—M. Léon Blum's ministry, the outcome of the elections of April 26 and May 3, 1936, which were characterized by the success of the Front Populaire, was a constitutional government upheld by a parliamentary majority; but it was also the instrument of a revolution, set in motion by its coming, which it made vain attempts to canalize. Its measures of social reform were too hurriedly carried out; and internal dissensions and pressure from outside sources, such as the Confédération Générale du Travail (C.G.T.) would probably have led to its fall in the autumn of 1936 if the parties of the Right had not violently attacked the minister of the Interior, M. Roger Salengro, who committed suicide. This dramatic episode reinforced ministerial cohesion.

Such was the state of affairs at the beginning of 1937. The financial situation became more and more critical. The "alignment" of the franc with the pound and the dollar did not prevent the franc from losing its value, and the measures taken by the Government remained ineffectual because disorder continued. The promise to suppress sit-down strikes could not be kept. M. Baréty, a member and former president of the Finance Commission of the chamber, evaluated at 36 milliards the total sums to be borrowed during 1937. The amount spent on armaments was not the only reason for this increased expenditure. The 1937

budget created more than 10,000 new posts. The number of men employed on the railways increased by 80,000, of whom 75,000 were peasants taken away from the land. Devaluation might have had some good results if it had been accompanied, as in Belgium and England, by an energetic policy of price restriction. It was accompanied by nothing of the kind. The violent rise in prices involved the Government in a vicious circle of prices and money. It was only possible to raise a loan in England on the security of the gold holdings in the Bank of France. An interpellation of M. P. E. Flandin on Feb. 26 only succeeded in detaching 16 Radical-Socialist votes from the majority. "The devaluation was the result of an initial failure," said M. Potut, a Radical deputy. "The second failure is marked by the rise in prices. The theory of purchasing power is destroyed. If the Government wanted to realize its promises, it would have to face a deficit of 55 milliards this year." "The combination of circumstances is fatal," said M. Flandin. "It is leading to the death of democracy and to dictatorship by the destruction of the middle classes. Anti-capitalism is the ruin of France, for capitalism includes the vast mass of people with small savings."

The Government, while declaring that it refused to modify its policy, nevertheless made a rapid *volte-face*. It declared that a "pause" was necessary, and the cabinet on March 5 decided on a certain number of urgent measures: adherence to the monetary agreement with England and the United States; abandonment of projects of exchange control demanded by the Socialists and Communists; the launching of a big loan for national defence; the setting up of a special commission to administer the Exchange Equalization Fund; and the restoration of free import and internal movement of gold.

On March 5 the ministry found itself at the parting of the ways, with, on the one hand, a steep slope going down to the abyss, and, on the other hand, a difficult path climbing up the hill. They chose the latter; it was a decisive moment in the history of the Front Populaire. At one blow the policy of the last eight months was reversed. It became M. Blum's object to inspire confidence in order to realize equilibrium, thus effecting a return to tradition and to financial common sense. The bill authorizing the issue of the National Defence Loan was passed by the chamber on March 9 by 470 votes to 46, and by the senate on March 10. The loan was a 4½% loan issued at 98, and it was safeguarded against fluctuations of exchange, as it was payable in francs, sterling, or dollars at the holder's option. It was easily covered (two milliards were subscribed) but less easily taken up.

Subsequently, extremist groups of the C.G.T. tried to force the Government to return to a revolutionary policy. The Clichy riots, provoked by the Communists, appear to have been a manoeuvre with the intention either of regaining control of a Government which was threatening to free itself, or else of breaking it. On March 16, the Parti Social Français, whose leader is Colonel de la Rocque, held a social evening for the members of the party and their families. A rumour, which proved to be false, had gone round that Colonel de la Rocque himself would be present. A gang of Communists, composed chiefly of foreigners and Negroes, attacked the hall where the meeting was being held. Five people were killed and 200 wounded. The aim of the extremists had been, on the morrow of the success of the loan and of M. Blum's liberal declarations to bring the Government face to face with insurgent popular forces and to compel it to take their side. But power remained on the side of the law, and the Government could make no further concessions to a revolutionary rising without irrevocably alienating the Radical party. M. Daladier, in a speech on March 21, said, "France is resolutely opposed to dictatorship, whether of a man, a party, or a class."

FRANCE: Industrial production index (The Annalist)

Henceforth, the days of the Front Populaire ministry under Socialist leadership were numbered, for the new policy of marking time and of a return to sound rules of finance was a Radical and not a Socialist policy. M. Blum could no longer restrain the influence of irresponsible elements upon his Government. The success of the Paris Exposition, which was to have opened on May 1, should have restored vigour to the economic activity of the country, but the bad spirit shown by the workmen delayed the preparations. The Exposition became the theatre for the manoeuvres of syndicalism. Public opinion became irritated at seeing the formation of a class of privileged persons to whom everything was permitted, who considered themselves beyond the law and who claimed the right to decide about everything, even in the domain of foreign policy.

In a speech on May 7, M. Blum pronounced himself unequivocally in favour of a long period of marking time, and rejected the proposals of the syndicalists. He declared himself a partisan, at any rate for the time being, of the authority of the employer and the discipline of labour. He proclaimed that "France cannot continue to live as it has lived during the past few years. No State can live with the obligation of procuring each year, outside the budget, sums almost equivalent to the normal budgetary receipts." Rise of prices and diminution of production were the outward signs of the failure of the Socialist policy. No one denies that M. Léon Blum and his ministry realized some necessary reforms. But certain of these reforms, for example, the five-day week, went farther than was intended, and the success of the whole policy was compromised by lack of discipline among the working-classes and by the resulting disorder.

The cabinet resigned because it found itself faced with the inevitable consequences of its policy of excessive expenditure and of repeated calls on an overworked credit which had suffered everything calculated to bring about a failure of confidence. In his speech at Luna park on June 6, M. Blum tried to put the responsibility for the failure of his experiment on to the resistance shown by the employers, and suggested that far-reaching reforms could only be realized under a Socialist dictatorship. The rapid diminution of gold stocks in the Bank of France, which had fallen, since the coming into power of the Blum cabinet, from 80 milliard Poincaré francs to less than 50 milliard, a figure considered indispensable for national defence, finally determined the Finance Committee of the senate to take the responsibility for a ministerial crisis. The senate, by 188 votes to 72, refused the Government the powers granted to it by the chamber, and the next day rejected an amended proposal by 168 votes to 96, with 35 abstentions. During the night of June 20-21, the Blum cabinet handed in its resignation to M. Lebrun, president of the republic.

In the circumstances in which the crisis took place, a Front Populaire cabinet under Socialist leadership could only be succeeded by a Front Populaire cabinet under Radical leadership, and the man asked to form this cabinet could hardly be other than M. Camille Chautemps. M. Blum agreed to the combination, and asked the National Council of the Socialist party to allow its members to enter the Chautemps cabinet, which could thus be rapidly constituted. There was no difficulty about this. Most of the ministers and secretaries of State retained their functions. M. G. Bonnet, former ambassador at Washington, became finance minister, while other ministers were M. Vincent Auriol (Justice), M. Campinchi (Marine), M. Chapsal (Commerce), M. Février (Labour), and M. Lebas (Post and Telegraphs).

There was only one way open to the new Government—the way indicated by the experts' plan for financial rehabilitation; plenary powers were obtained from parliament in order to put this into effect. The franc was detached from gold, that is to say, it became a free, floating monetary unit no longer convertible into

a fixed quantity of gold. This was the only means of checking the gold withdrawals which were becoming more and more frequent. The tripartite agreement with the Banks of England and of the United States remained in force. M. G. Bonnet applied himself with great perseverance to the tasks of improving the financial situation and balancing the budget. The pound, which was worth 110.55 francs, went up to 129. The franc, nine months after a reduction of 33%, suffered a further devaluation—not the last either—of 14%. The result of this constant devaluation is the ruin of the middle class by the reduction, without profit for anyone, of its purchasing power.

The immediate measures taken by M. Bonnet consisted of an increase of 15,000 million francs in the advances made by the Bank of France to the Treasury, new taxes, particularly direct taxes, and increase of old taxes. But the reduction of expenses was rendered useless by the increase in prices which compelled the Government, in November, to proceed to a readjustment of officials' salaries. Budgetary equilibrium, which had been established with such great difficulty, was thus perpetually endangered anew. Financial difficulties were further complicated by the need for heavy expenditure on national defence. In December the franc oscillated between 145 and 150 to the pound. The deficit in the balance of trade, despite some improvement in business, amounted during the year to more than one milliard francs a month. The violent reduction in hours of work diminished production and export possibilities to a dangerous degree.

By the declaration of Rambouillet on Oct. 2, the cabinet affirmed that, contrary to the theories expounded by the Socialist and Communist newspapers, psychological and political, rather than technical, reasons explained the speculative attack on the franc. Tension from outside and the fear of renewed social disturbances were chiefly responsible. The Government enumerated the measures they proposed to take in order the better to apply those principles of public order and social discipline on which they had taken their stand. But they were constantly hampered in the operation of this program by the policy of the C.G.T. and the resistance of one section of the chamber. The cantonal elections, which took place on Oct. 10 and 17 throughout the whole of France except the Seine, showed a definite retreat from Communism and a success for the parties of order, and indicated approval of the senate's policy. They consolidated the power of the Radical-Socialist party, and even placed it in a position to do without the assistance of the Communists in parliament, and even of the Socialists if the Centre and Right parties were not too deeply divided.

The success of the Exposition would have been much greater if the opening had not been delayed by lack of co-operation on the part of the workmen, and if uncertainties abroad had not reduced the number of foreign visitors. The total number of visitors was over 31,000,000, but there had been over 35,000,000 at the Colonial Exhibition.

The foreign policy of the Blum and Chautemps cabinets remained, under M. Yvon Delbos, faithful to its principles of collective security, collaboration with the League of Nations, and friendship with Great Britain. The civil war in Spain and the influx of refugees caused great difficulties on the Pyrenees frontier. The policy of non-intervention in Spain, successfully advocated

ALBERT LEBRUN, President, France

France and Great Britain, was observed by the French Government, but local authorities, and even certain ministers, favoured the passage of arms and ammunition for the Valencia Government. The Nyon Conference organized the policing of the seas; and attacks on merchant vessels practically ceased.

**Trade and Communications.**—France, thanks to the quality of her soil and to her climate, is extremely fertile, and the variety of her products is remarkable. The country produces itself about 50% of what it consumes. The grain harvest varies from year to year between 65 and 98 million quintals. In 1933, it amounted to 98,611,000 quintals, in 1936 to 66,502,000 quintals. Agricultural production in general was poor during 1936, partly owing to unfavourable weather conditions and partly to economic conditions which pressed particularly hard upon the peasants. As regards wine, France occupies a privileged position in the world. She produces more than any other country: 39,499,000 hectolitres in 1936, with an average of 57,000,000 hectolitres for the three previous years. There was an improvement in 1937, and the production figure rose again to 51,375,000 hectolitres. The value of agricultural products is gradually being restored.

In this connection mention must be made of the recent creation, in Aug. 1936, of the Office du Blé, which has not produced all the results hoped for from it.

France is particularly rich in iron ore, especially since her recovery of Alsace and Lorraine, and she is not infrequently among the foremost countries of the world in its production. Her reserves are about 18 milliard tons. Production in 1936 amounted to 33,208,000 tons, an increase of 1,000,000 tons over the preceding year. The amount of coal mined diminished somewhat, the figure for 1935 being 47,107,000 tons, while that for 1936 was 46,147,000; but since 1937 it has risen again as a result of measures adopted on Sept. 14, 1937, allowing of departures from the 40hr.-week regulations.

Industry occupies 39.1% of the active population in France, as against 12.1% engaged in commerce and 35.6% in agriculture. The textile industry represents nearly a quarter of the industrial production of France. Mechanical industries occupy 935,000 workmen, and rank second among the country's export industries.

Imports and exports for 1937 were valued at (in 1,000 francs) 23,15,578 and 23,935,241 respectively, as compared with 1936 figures of 45,398,044 and 15,453,625.

The deficit for 1936 amounted to 9,944 million francs, an increase of 82% on the previous year. In 1937, the deficit showed a considerably greater increase, amounting to over 18 milliards. The share of the French colonies in the external trade of the mother-country continued to increase, amounting to 28.5% of the imports and 33.4% of the exports.

The total tonnage of the French Mercantile Marine in 1936

#### Movement of Shipping in Six Chief Ports

Marseilles and neighbouring ports . . . . .	9,251,319 metric tons
Rouen . . . . .	8,002,404 metric tons
Le Havre . . . . .	5,775,881 metric tons
Dunkirk . . . . .	4,600,088 metric tons
Bordeaux and neighbouring ports . . . . .	4,302,201 metric tons
Nantes and St. Nazaire . . . . .	3,420,735 metric tons

as 3,020,442 tons. Total movements of shipping during 1936, entering and leaving harbours, numbered 170,725 ships, a gross tonnage of 143,357,453 tons, an increase over 1935 of 4,390 ships and 1,950,000 tonnage. Passengers taken: 4,979,717.

The year 1936 was a bad one for the French railways (about 7,120mi. of line). The deficit amounted to 3,977 million francs. During 1937 the Government, in hopes of remedying the situation, decided on the fusion of the seven great companies into a Société nationale des Chemins de Fer, which came into operation on

GEORGES BONNET, French minister of finance in 1937

Jan. 1, 1938. Gross receipts for 1937 showed an increase of 2,437,058,000 francs over 1936. Over 2,210mi. of line have been electrified, not counting the Paris-Marseilles line, where trains drawn by Diesel electric engines are in operation.

There are some 384,200mi. of roads in France. Autostrades are planned, and one, from Paris to Le Havre, is already under construction. There are about 9,550mi. of navigable waterways, of which about 4,035mi. are main waterways. The aeroplanes of the Air-France Company, constituted in 1932, covered in 1936 a distance of 5,973,900mi., transporting 66,670 passengers (an increase of 7.95% over 1935) and more than 1,260 tons of freight.

**Finance and Banking.**—Since 1936, two devaluations have taken place in France. By the first, on Oct. 2, 1936, the franc lost 33% of its value, while the second of June 30, 1937, instituted a new basis, the "floating franc." At that time the pound was worth 129 francs; at the end of Dec. 1937 it was oscillating between 145 and 150.

On Dec. 17, 1937, the Chamber of Deputies voted the budget for 1938. The figures were: receipts 54,600,557,808 francs, expenditure 54,599,318,506 francs. The budget for 1937, the receipts for which were fixed at 43,481,899,289 francs, shows a deficit of 4,589,268,442 francs. The national debt on Dec. 31, 1936, amounted to 355 milliards.

On June 24, 1937, the gold holdings in the Bank of France amounted to 54,859 million francs; on Jan. 13, 1938, they amounted to 58,932 millions. Savings banks' balances due to depositors on Dec. 31, 1936, amounted to 34,920 million francs in ordinary savings banks, 23,974 million francs in Post Office Savings banks, making a total of 58,894 millions, as against 62 milliards in 1935.

**Education.**—Education is conducted in France either by the State institutions, or by "free" institutions which are for the most part Catholic. Education in general is under reorganization, but at present consists of three stages. Examinations at the end of the two first stages allow the student to proceed to the third stage. In every Commune of France there is at least one State elementary school. Education in the first two stages is free. In 1937, there were 70,000 elementary schools, with 4,411,000 pupils. In 1935, there were more than 160,000 pupils in the State secondary schools (*collèges* or *lycées*). There were then 73,852 university students in the whole of France, a decrease of 8,366 from the previous year.

**Defence.**—Military service is compulsory for a term of 2 years.

Army	
Troops stationed in France in peace time . . . . .	400,000 men
Total strength in peace time . . . . .	680,000 men
Reserves . . . . .	4,000,000 men
Maximum strength in war time . . . . .	8,000,000 men
Air Force	
Total strength . . . . .	40,000 men
Navy	
Total strength . . . . .	65,000 men
Total tonnage . . . . .	700,000 tons
Tonnage of ships of the line . . . . .	221,000 tons
Tonnage of submarines of the line . . . . .	84,000 tons

#### Budget figures for 1937:

Army . . . . .	5,857,000,000 frs.
Air . . . . .	1,240,000,000 frs.
Navy . . . . .	1,811,000,000 frs.

**BIBLIOGRAPHY.**—*La France économique en 1936; Annuaire de la Vie économique Française* (1937); *L'évolution de la vie économique française 1910-1937* (Paris); Institut Scientifique de Recherches économiques et sociales (1937). (R. PIN.)

**Franco, Francisco** (1892– ), Spanish general and revolutionary leader, since Oct. 1, 1936, head of the insurgent government in Spain, was born in Galicia. After military service in Morocco, he became a colonel in 1926, and served under the Spanish republic of 1931 in the Balearic islands, being later transferred to Morocco again. In 1935, he was made chief of staff. Under the Lerroux-Robles government he became governor of the Canary islands. On the outbreak of the civil war in June 1936, he flew to Tetuan, in Spanish Morocco, and there organized the transport of Foreign Legionaries and Moorish troops to the Spanish mainland, whither he soon followed.

After the death of Gen. Sanjurjo, Gen. Franco became military leader of the insurgents, and on Oct. 1, 1936, was solemnly invested at Burgos with the titles of "Commander-in-Chief of the Spanish Army" and "Chief of the Spanish State." He at once began a siege of Madrid, but, largely owing to his detour to relieve Toledo, his expectations of that city's early fall were not fulfilled.

On April 20, 1937, he issued a decree, by virtue of which he became the political, executive, and military dictator of a totalitarian State, and on Aug. 5 he assumed the leadership of "the Spanish Phalanx of Traditionalist and Offensive National Syndicalist Juntas."

After his march into and conquest of the Basque country in June, he appealed in July to the Powers to grant belligerent rights to the Spanish rebel forces, and on Aug. 27 exchanged congratulatory messages with Signor Mussolini after his capture of Santander. For his later activities in relation to the civil war, see SPAIN and SPAIN, CIVIL WAR IN.

**Franklin, Edward Curtis** (1862–1937), American chemist who became internationally recognized as an authority on the ammonia system of compounds and liquid ammonia as an electrolytic solvent. In 1929 he retired from the chair of organic chemistry which he had held at Stanford university since 1903. The Nichols Medal was presented to him on the expiration of his term as president of the American Chemical Society in 1925. He died at Palo Alto, Calif., Feb. 13, 1937.

**Freemasonry.** Improved economic conditions resulted in the reinstatement of approximately 50,000 Master Masons, following suspensions or demissions during recent years. Losses, shown as 144,402 in 1934, were reduced to 66,261 in 1937, leaving a total membership of 2,599,250 among 15,826 lodges. Seven jurisdictions out of fifty (the forty-eight States, District of Columbia and the Philippines) revealed gains, with many more indicating an increasing number of applicants. Local relief through lodges was increased, aided by improved budgeting of lodge finances.

Educational work, covering the history, symbolism and philosophy of the Fraternity and suggestions for the practical application of Masonic teachings in good citizenship, received ardent support in grand and local bodies. The Masonic Service Association of the U.S. (organized 1919) has been a continued weighty factor in this activity. The informal annual conferences of Grand Masters and Grand Secretaries, held at Washington, D.C., each February, contributed their efforts in related movements.

Forty-six Grand Lodges participated in the 1937 conferences.

The Grand Lodge of South Carolina celebrated its bi-centenary in April, and Texas its centennial in December. The Supreme Council 33°, A.A.S.R., S.J., completed its gift of \$1,000,000 to George Washington university for the establishment of a school of government, and continued its moral support to opposing diversion of public funds for sectarian purposes. The Supreme Council 33°, A.A.S.R., N.M.J., contributed to humanitarian work in a fourth gift (now totalling \$140,000) for researches in the cause and prevention of dementia praecox.

**Great Britain.**—The Duke of York was installed as Grand Master Mason of Scotland, Nov. 30, 1936, but upon ascending the English throne as George VI, resigned the office in keeping with old customs. On June 30, 1937, he was invested as a Past Grand Master of the United Grand Lodge of England. He is the fourth British Mason to ascend the throne. A severe loss was the death on Nov. 5 of Sir Philip Colville Smith, C.V.O., who had been Grand Secretary since 1917.

**The Continent.**—The citizens of Switzerland by a vote of 514,539 to 233,481, on Nov. 28, defeated a proposed amendment to the Constitution by which all secret societies would be forbidden. The bill had been rejected previously by the Swiss Council of State, Senate, and Parliament. Catholic laymen supported Freemasons in this election, the former sensing the move to eventually cripple all rights of free association, such as had followed the suppression of Freemasonry in Italy, Germany, Turkey, Spain, and Brazil under dictatorships. Close ties between Scandinavian and English-speaking Freemasonry have been strengthened through the visits of American Grand Masters to Denmark and Sweden in 1936, where King Christian X and King Gustav V, respectively, are Grand Masters of Masons. (J. H. T.)

**French Academy.** The French Academy held in 1937 four important official functions, at which the following were received into the Academy: Joseph de Pesquidoux, famous for his work on the occupations and pleasures of the countryside in southern France; Edouard Jaloux, a critic of great renown; Admiral La Carze, who is known chiefly for his work as minister for the navy during the war; and Monseigneur Greute, bishop of Le Mans, who is to keep up the tradition of great prelates within the Academy. René Doumic, one of the most influential of the academicians and known as a critic, died. Among the numerous prizes and distinctions awarded by the Academy, the most notable are: the *prix de littérature* to Maurice Magre, a poet; the *prix du Roman* to Guy de Pantalès; and the *prix Brieux* to Gabriel Marcel for his plays. (D. S.)

**French Congo:** see FRENCH EQUATORIAL AFRICA.

**French Equatorial Africa.** The area of French Equatorial Africa is c. 912,000 sq.mi., and the population (1934) was c. 3,319,000, of whom about 4,700 were Europeans. The rapid development of French Equatorial Africa is hampered by its tropical climate and vegetation and by the scattered and backward nature of the native population. The governor-general, M. Preste, has established a systematic program of production, administrative reforms, public works, and protection of the natives. The cultivation of cotton produces excellent results in the Ubangi, and coffee-growing also promises good returns. In the tropical forest region, timber is the principal export, though the sale of *okoumé* in Germany has become more difficult. The problem of transport remains predominant, but the difficulty of portage is diminishing with the construction of roads, 875mi. of which were opened in the year beginning in July 1936. Considerable progress has been realized

by the opening of the Congo-Ocean railway from Pointe Noire to Brazzaville. The Congo-Ocean transported in 1936, 23,548 travelers, 31,000 tons of merchandise for import and export, more than 18,400 tons of merchandise for local use, and quantities of ballast for the harbour works at Pointe Noire. The receipts amounted to 14,173,065 francs. The subsoil is found to be even richer than was thought in copper, gold, lead, tin, manganese, zinc, and diamonds, but the nature of the soil and the climate make exploitation difficult. Exports, which for the first quarter of 1936 amounted to 191,000 tons, rose to 272,000 tons for the first quarter of 1937.

(R. PIN.)

**French Guiana,** a French colony in North-eastern South America, including the separate interior Territory of Inini. Language, French; capital, Cayenne (pop. 17,704); governor, René Veber. The area, including Inini (area, 5,000 sq.mi.), is 34,740 sq. miles. The population of French Guiana was 29,085 (including 2,934 foreigners), in 1936, with 15,510 in Inini. The colony is administered by a governor and general council and is represented in the French parliament. Inini has a separate council. The famous French penal colony, Devil's Island, located on the northern border, is administered separately. In Sept. 1937 the French labour arbitration act of 1936 was extended to Guiana by decree. During 1937 the colony showed considerable development due to the devaluation of the franc, which stimulated gold production. Imports and exports in 1936 totalled respectively 5,343,821 fr. and 26,536,884 francs. Imports, chiefly foodstuffs and manufactured articles, came from France (64.2%) and the United States (8.8%). Practically the entire exports, comprising principally 23,726,000 fr. gold, and rosewood, went to France. The first nine months of 1937 showed 25% increase in imports and 60% in exports.

French Guiana has regular external steamer and aeroplane service, 12km. of railroad, 250km. of highways, and good interior waterways. The monetary unit is the French franc (value: 3.4¢ U.S.).

**French Guinea:** see FRENCH WEST AFRICA AND THE SAHARA.

**French Indo-China.** The area of French Indo-China is about 285,000 sq.mi., and the population (1936) was c. 23,230,000, of whom about 30,700 were French.

Two very important measures have been taken in favour of the natives. One of these, by a decree of July 23, 1937, allows young natives who have passed certain examinations to be recognized as French citizens with full civil and political rights, merely by entering a demand for citizenship with the appropriate tribunal. A particular result of this measure will be to eliminate by degrees the French low-grade officials serving in Indo-China. Another measure is the regulation of work on a large scale on lines adopted from France.

In the different countries composing French Indo-China, the main features of progress during 1937 have been as follows: In Yochin-China, new native schools have been opened. In Cambodia, sanitary organization has been developed, and usury, which has prevented the growth of a class of peasant proprietors, combated. As regards Laos, a distant country difficult of access and therefore backward, efforts have been made to improve communications, both by air and by road, with the interior. In North Annam, irrigation of the Nghé An was begun, thereby making it possible to irrigate 86,500ac. and to obtain from this vast area two annual harvests of rice instead of one. In Tongking, the Government did much to alleviate the widespread distress caused by the flooding of the Red river.

Air communications have been speeded up, and the journey from Paris to Saigon can now be accomplished in five days.

(R. PIN.)

**French Literature.** The most notable event of the year has been the award of the Nobel prize for literature to Roger Martin du Gard for the seventh part (in 3 vols.) of his saga: *Les Thibault*. The six previous parts were the somewhat lurid tale of the inner life of a rich family. The three volumes which won the Nobel prize describe mainly the activities of a group of revolutionaries (to which a Thibault belongs) immediately before the war of 1914. As a work of art, this novel is rather below the high standard of the other volumes; but no doubt its pacifist sentiments touched the prize-givers.

Georges Duhamel also added two volumes to his *Chronique des Pasquiers: Le Désert de Bièvres* and *Les Maîtres*: both contain an admirable description of intellectual life in Paris, the first among students, the second among professors. These volumes are, if anything, better even than the first volumes of the series.

Jules Romains also added two volumes to his *Hommes de Bonne Volonté: Mission à Rome*, which is a tale of church intrigues at the papal court, and *Le Drapeau Noir*, which deals with 1914 and the coming of the war in a more concise and objective way than Roger Martin du Gard. Jules Romains published an important racial political poem: *L'Homme Blanc*.

Not all the French writers, however, have succumbed to the saga fashion. Maurois has turned historian. His *Histoire d'Angleterre* has established itself at once and been highly praised by professional historians for its impartiality (a quality rarely, if ever, reached by a historian writing about his own country), its clarity, and its elegance. But Maurois has not forgotten his earlier trade and has delighted his public once more with a fantastic story: *La Machine à Lire les Pensées*.

Giono writes "epics" in prose rather than novels: *Bataille dans la Montagne* describes tremendous floods in an Alpine valley and contains some descriptions of nature in convulsion which are among the best in French literature.

Malraux, from his adventures in Spain, has also constructed an "epic" narrative, *L'Espoir*, relating, with an astonishing mixture of enthusiasm, objectivity, and extreme realism, incredible episodes of the civil war.

Céline, today the undoubted master of the realist tradition, has published a wild and violent attack against the Jews and the Soviets, set in the form of an extravagant lyrical essay, *Bagatelles pour un Massacre*, worthy of his previous successes, *Mort à Crédit* and *Voyage au bout de la Nuit*. His power in the use of popular or imaginative language gives him a lasting value.

At the other end of the intellectual world, Paul Valéry has published a very sophisticated piece of high literature, *L'Homme et la Coquille*. His appointment at the Collège de France as professor of poetry is something of a national event.

Thibaudet's *Histoire de la Littérature Française de 1789 à nos jours*, published late last year, should be recalled as the most thought-provoking book of its kind in French, in which full justice is done at last to Balzac, Baudelaire, and Hugo.

Among outstanding autobiographies are André Gide's *Journal* (in complete works chronologically arranged); Julien Benda's *La Jeunesse d'un Clerc* and *Un Régulier dans le Siècle*; Ella Maillart's *Oasis interdites* (travels in Central Asia). Romain Rolland's *Journal* is deposited in a Swiss library, and will be available in twenty years' time.

**French Somaliland:** see SOMALILAND, FRENCH.

**French Sudan:** see FRENCH WEST AFRICA AND THE SAHARA.

## French West Africa and the Sahara.

The area and population in 1934 were as follows: area, 1,604,000 sq.mi.; population 14,469,000, including 42,350 Europeans.

**History.**—French West Africa was less disturbed than North Africa by the repercussion of events in Europe and the application of social legislation. Only a few riots were recorded, unimportant except for that at Dakar among the black French electorate. On the other hand, economic difficulties were much in evidence, and the great development effort undertaken by Governor-General Brévié (now in Indo-China) and continued by successor M. de Coppet, was paralyzed by the poverty of resources and the financial crisis.

The minister for colonies, M. Marius Moutet, who inspected Senegal and Mauritania in the autumn of 1936, visited Sudan, Dahomey, and Togo from March 23 to April 21, 1937. His journey demonstrated the rapidity and ease of air and land transport. In two days he went from Paris to Gao, on the Niger, 2,500 mi. by Air-France and Air-Africa planes. He returned convinced that the first condition of economic development in the Sudan is the increase of the population and consequently the growth of foodstuffs. The creation of a "black peasantry," advocated by M. Delavignette, today director of the École Coloniale, is therefore one of the first items of the economic program. "It is through the individual, through the man, that Africa must progress," said M. Moutet on his return. "The population of French West Africa can increase in one generation from 15 to 30 millions, on condition that we pursue a policy of health measures, native education, improved agricultural methods, and development of the soil." This is one of the objects of the great works undertaken on the Upper Niger, the barrage at Sansanding, and the Sotuba canal, which is to irrigate the ancient kingdom of the Macina, formerly rich and populated, today suffering the encroachment of the Sahara. This region is particularly favourable for the cultivation of cotton of excellent quality, the first bales of which are now beginning to arrive on the European markets. But at the same time attempts are being made to develop the cultivation of foodstuffs (vegetables, rice, cereals) in order to nourish the black population.

**Agriculture.**—Senegal, Mauritania, and the colonies on the Atlantic seaboard have suffered from the decrease in price for oil-products on the European markets. Peanuts and copra are their chief products. The price of peanuts, the one source of wealth of Senegal, has gone down considerably; customs dues on foreign peanuts entering France have been reduced by one-half, licences for the import of foreign peanuts have increased excessively, costs of transport have gone up, and an export duty has been imposed. On the other hand, articles imported from France have gone up, so that the native has had to suffer too from events in the mother-country. Trade nevertheless is increasing; for example, in Guinea (total of 189 million francs in 1936, chiefly gold and bananas). New markets have allayed fears of over-production of cocoa and bananas. Attempts to apply social legislation were quickly abandoned; they would have had a disastrous result in this country where the native is naturally lazy.

**Communications.**—Communications with North Africa by aeroplane and car, the improvement of the Saharan tracks, and the exploration of the Great Desert, combined with increased safety of travel in it, have all formed the object of successful efforts on the part of both military and civil authorities in French West Africa and in Algeria. The well-defined track from Algeria to the Gulf of Guinea by El-Golea, Tamanrasset, Agadès, and Zinder makes it possible to cross the Sahara in comfortable cars. There are quite well-organized hotels on the route. A weekly service runs to Tamanrasset, to which travellers are drawn by memories of a

saint and of a hero—Père de Foucault and General Laperrine. The Hoggar has become a tourist centre (Tropical Transport Service of cars). The Air-Africa aeroplane is even quicker. An Algerian trade mission visited the regions of the Niger in 1937. Throughout the year no incident disturbed the security of the desert. Financial reasons delay the construction of the Trans-Saharan railway. But the Sahara is definitely conquered, and is becoming the backbone of the French African empire. (R. PIN.)

**Fruit:** see APPLES; BANANAS; GRAPEFRUIT; GRAPES; LEMONS AND LIMES; ORANGES; PEACHES; PEARS; PINEAPPLES; PLUMS AND PRUNES.

**Fruit Insects:** see ENTOMOLOGY.

**Functionalism:** see ARCHITECTURE: "Functionalism."

**Fungi:** see BOTANY: *Fungi*.

**Furniture Industry.** There are over 3,000 recognized manufacturers of furniture in the United States who employ nearly 130,000 workers. The annual wages paid to these workers is about \$120,000,000 and the annual value of their products at wholesale runs to about \$450,000,000. Furniture manufacturing is divided into the following classes: upholstered furniture; case goods (dining and bedroom furniture); novelty furniture, such as desks, tables, etc.; kitchen furniture, including breakfast sets, etc.; reed and fibre furniture and metal furniture.

It is estimated the percentages of the different kinds of wood used in the manufacture of furniture at the present time are: birch 11%; walnut 2½%; mahogany 2%; gum 27%; maple 10%; oak 12%; all other hardwoods 35½%. Today there is about an even division in the use of walnut and mahogany, with walnut leading slightly in the upper priced brackets. For less expensive furniture, a great deal of gum and birch is used.

There are no statistics for the output of the furniture industry in Great Britain, but the industry has increased greatly since the World War, much new capital being invested both in the manufacturing and in the retail business. English manufacturers produced large quantities of antiques in the style of Adam, Sheraton, Chippendale and others.

Nor are there any statistics for the volume of furniture manufacturing in France. In Paris or its vicinity are upwards of 2,000 manufacturing firms, the value of whose exports, largely reproductions of traditional periods, amount to a considerable sum. (See also INTERIOR DECORATION: *Furniture*.) (L. KAR.)

**Furs.** The year 1937 was disappointing to the wholesale branch of the fur trade. Production was heavy in the first half of the year. Credit was extended too freely. There was over-expansion and over-buying. Skin prices were inflated. Production costs were higher than in 1936. Consumer demand decreased, weather conditions were unfavourable. Prices fell as much as 60% during the second half of the year. Buying by retail stores practically ceased in the fall. Over 160 insolvencies were reported in the American fur trade in 1937 as compared with 93 in 1936 and 86 in 1935. Most of these failures were in New York. Liabilities totalled over \$3,572,904; almost twice the amount recorded in each of the three previous years. The year ends with the American fur trade facing 1938 on a price basis, so far as its raw material is concerned, similar to the basis of 1934; but with the prospect of a reduced supply of fresh peltries from the United States, Canada, and China. The carry-over of unsold fur skins from the 1936-37 crop, however, is sufficiently large to minimize the possibility of any sudden upturn in prices because of the shorter supply in 1938. America imported over \$81,000,000 worth of furs and exported over \$16,000,000 worth of furs and

skins during 1937. These totals were somewhat greater than the figures for 1936.

The Russian fur trade transacted an international business during 1937, with the United States, Great Britain and France the largest buyers at the two auction sales held in Leningrad in March and July. The London fur market transacted a large business on Russian, Canadian, American, and British Colonial furs. It was the greatest market for silver fox from Canada and Scandinavia. Australia and New Zealand sold about 80% of their respective catches of rabbit skins to the United States, valued at around \$9,000,000. The China fur trade came to a standstill in August, but by that date most of the 1936-37 production of furs and skins valued at about \$30,000,000 had been sold and shipped with the United States the market for the larger proportion. The 1937-38 season for China furs was practically abandoned because of the Japanese invasion of China.

Taken as a whole the world's fur trade in 1937 was less than in 1936. Import restrictions, quotas and prevailing "exchange" limitations prevented the free flow of furs in international trade. See also FASHION AND DRESS: *Furs*. (W. J. Br.)

**Gallwitz, Max von** (1852-1937), German army officer, who bombarded Namur, took part in the German offensive against Russia on the Narew river in Aug. 1915, and led the 11th army in the Serbian campaign and the 7th army on the Verdun front. Born at Breslau, May 2, 1852, he took part in the Franco-Prussian War before entering the War Academy. Promoted to captain in 1886, he served on the general staff and was later transferred to the war ministry. After serving as commander of the 15th division, he became inspector-general of field artillery in 1911. He was ennobled in 1913 and entered politics after the war serving as a member of the Reichstag from 1920-24. His death occurred in Naples, April 19, 1937.

**Gambia,** a British crown colony and protectorate in West Africa, extending up the banks of the River Gambia as far as Yarbutendi. The governor is Sir Wilfrid Thomas Southey, K.C.M.G., K.B.E., appointed in 1936, and the capital is Bathurst. The area is c. 4,132 sq.mi., and the population (estimate, Dec. 1936) 197,811. The colony, as distinct from the protectorate, comprises Bathurst, Georgetown, and some adjoining land, with a total area of 69 sq.mi. and a population (1931 census) of 14,370. Elementary and secondary education are provided by missions and Government grants, and a committee of Mohammedans runs the Mohammedan school. There is a Government manual training centre and a school for the sons of chiefs at Georgetown. The chief exports are ground-nuts, hides and skins, and palm kernels. Total exports for 1936 amounted to £501,238, and imports to £82,476. There is no telegraph system, and no railway; internal communications being maintained by four wireless stations, and mails being conveyed by Government river steamers. The Bank of British West Africa is the only bank, and West African notes and currency are in circulation.

**Gandhi, Mohandas Karamchand** (1869- ), Hindu Nationalist leader. For a biography, see *Encyclopædia Britannica*, vol. 10, p. 15. In April 1930 he inaugurated a campaign against the salt laws, for which he was interned on May 5, being released in Jan. 1931 to attend the Round Table Conference as a delegate. From Jan. 1932 to May 1933 he was again imprisoned. After the elections for the provincial legislatures in 1937 had resulted in the Congress party winning a majority in six provinces, he recommended it to accept the assurances were given that the governors would not use

their veto or set aside the advice of the ministers "in regard to their constitutional activities." At Madras on Jan. 22, 1937, Mr. Gandhi announced his retirement from Indian politics. On Aug. 4 he visited the viceroy and, besides discussing rural uplift and the condition of the peasantry, was instrumental in the raising of the ban against the entry of the agitator, Abdul Ghaffar Khan, into the North-west Frontier province; then later in the same month he was advocating total prohibition for all India.

**Gardner, Percy** (1846-1937), British archaeologist, who taught at Cambridge and Oxford and was an expert on coins for the British museum. He died at Oxford, July 18, 1937. An account of his career may be found in the *Encyclopædia Britannica*, vol. 10, p. 24.

**Garvan, Francis Patrick** (1875-1937), president of the Chemical Foundation and U.S. custodian of alien property following the World War, was born in East Hartford, Conn., June 13, 1875. Soon after graduating from Yale and the New York university law school, he became assistant district attorney for New York city and in late 1917 was chosen as director of the U.S. Bureau of Investigation. As alien property custodian following March 1919, he sponsored the establishment of American chemical manufacturing. From 1919 to 1923, he served as dean of Fordham law school. Known for his gifts to Yale and for his contributions to the cause of chemical study, he died in New York city, Nov. 7, 1937.

**Gas.** Developments in the production and utilization of gaseous fuel are giving a new emphasis to the functions of gas manufacture and supply in relation to the general political economy. Present-day fuel requirements are more exacting than has been customary in the past, and it is increasingly realized that gaseous fuel represents a means of combining the desired degree of control, flexibility, and cleanliness characteristic of a high-grade fuel with economy in the use of natural resources.

In the United States, as indeed might be expected of a nation possessing and exploiting such a vast natural wealth of petroleum, the most striking advance in gas output has been in the amount of natural gas distributed both by pipe line and compressed as "bottled gas." In 1936 natural gas represented 68% of the energy supplied in gaseous form to domestic and commercial consumers. "Bottled gas," that is, propane and butane liquefied under pressure in steel cylinders, is supplied direct to industrial and domestic consumers, and also to gas companies for distribution through mains in the smaller communities. The amount sold direct to domestic consumers in 1936 was equal in heat energy to some 10% of the total of manufactured gas, and still larger quantities are available both from the petroleum wells and the refineries. At the same time, the manufactured gas industry records an advance of 6% in its output, as compared with the previous year, the increase being for commercial and industrial purposes and for house heating. Of the total quantity sold by the manufactured gas industry, 40% was water gas, 13.6% coke-oven gas, 7% retort coal gas, and the remainder oil gas in various forms obtained by processing either oil, natural gas, or refinery gases.

Great Britain, possessing practically no home sources of oil but plentiful supplies of coal, has met the increased requirements of gaseous fuel by the carbonization of more coal in gasworks and by the purchase of increased quantities of coke-oven gas. The total quantity of gas sold in 1936 by authorized undertakings was 4.8% greater than in 1935, 1,040,000 tons more coal being carbonized, and 3,875 million cu.ft. of additional gas being purchased from coke ovens. The total quantity of gaseous fuel sold passed the 300,000 million cu.ft. mark for the first time,

coke-oven gas purchased and resold amounting to over 24,000 million cubic feet.

In Germany, also, coke-oven gas is playing an increasing part in the supply of gaseous fuel, having increased from 18% of the whole in 1924 to 70% of the whole in 1936, the quantity of gas manufactured in gasworks being about the same in both years. Thus it may be said that the entire increased demand for gaseous fuel has been met by collecting and distributing surplus gas from the coking industry. A particularly interesting development is the successful attempt to make adequate use of the large deposits of lignite, the coal resources of Germany being represented more largely by these younger coals than by the rich bituminous and anthracitic coals typical of the United States and Great Britain (see COAL INDUSTRY: *World Production*). Lignites are now being carbonized at low temperatures for the production of tars to be hydrogenated to motor spirit, and gasified in steam and oxygen under a pressure of several atmospheres, both for the production of town gas and for the production of gas to be used in the synthesis of motor spirit and oils.

The production of fuel for automobiles from indigenous resources is the concern of several European countries, Germany leading in the production of liquid fuels from coal, but, also encouraging the use of gas compressed in cylinders, while France and Italy are displaying considerable interest in the generation of gas from charcoal or coke by a producer carried on the vehicle.

Improvements in the design of appliances and a greater demand for automatic operation and control have led to more intensive study of the combustion characteristics of gas and the effect of minute traces of impurities. The work of Fulweiler in the United States and of Hollings in Great Britain has elucidated the factors affecting the production of gummy deposits, and, although the offending substance, nitric oxide, is present only to the extent of a few parts per million, practical methods of preventing the deposition of gum have been recorded. In Great Britain there has also been a notable advance in the extent to which gas is treated for the removal of the small quantity of sulphur compounds remaining after normal purification. Such processes are generally associated with the recovery of benzole, but there have also been important developments in catalytic processes having the same object in view. (See also PUBLIC UTILITIES.)

**Gas Masks:** see CHEMICAL WARFARE; CIVIL POPULATION, PROTECTION OF; MUNITIONS OF WAR: *Chemical Warfare*.

**Gasoline.** More gasoline was consumed in the United States in 1937 than ever before. The reason is that more automobiles are on the roads, and the roads are better, and the cars driven more. Moreover, the revival from the depression, until its recent interruption, put America emphatically on wheels again.

To meet the demand of the almost 40,000,000 motor vehicles now being operated, it was necessary for the petroleum industry to provide about 527,000,000 barrels of gasoline. The increased consumption for 1937 over 1936 will be in the neighbourhood of 10%. And 1936 was a record year for gasoline use.

Practically without a connecting State highway system in 1919, the United States has built in the intervening years a connecting State system of some 520,000 mi. of roads of which 371,000 mi. or over 70% is surfaced. Altogether the country's local and State roads total over 3,000,000 miles. Most of this highway improvement has been financed on a pay-as-you-go basis by State gasoline taxes levied on the motorist. (See GASOLINE TAX.) Growth of

motor fuel demand in the United States parallels the rise in motor vehicle registrations, as the following table shows:

	Gasoline Demand (Thousands of Barrels of 42 U. S. Gals.)	Automobile Registrations (Number of Motor Vehicles— Passenger Cars and Trucks)
1936 . . . . .	481,591	28,221,291
1933 . . . . .	380,494	23,843,591
1930 . . . . .	397,770	26,545,281
1927 . . . . .	305,367	23,133,243
1924 . . . . .	196,586	17,595,373
1921 . . . . .	116,840	10,463,295
1918 . . . . .	79,949	6,146,017

An important factor contributing to the growth of automobile use and of gasoline demand, has been the ability of the American petroleum industry to keep gasoline prices at low levels. According to statistics issued by the American Petroleum Institute, the average total retail price, less tax, in 50 representative cities was 29.74¢ per gallon in 1920 when 9,000,000 cars were on the roads and in 1936 when 28,000,000 motor vehicles were operating it was 14.10¢ per gallon.

Expanding airline mileage in the United States has added a substantial figure to gasoline demand. While this is but a low percentage of total demand, its importance may be said to be in the technical development of suitable aviation fuels, which, in turn, bears direct relationship to the technical development of motor fuels. Motor fuel was first produced at refineries by straight distillation, and later by cracking. The quantity of gas produced in the cracking process increases with the improvement of the anti-knock quality of the motor fuel product. A satisfactory economic disposal of this gas was a real problem for American refineries. This problem was solved by the polymerization process. The cracking process depends for its economic utility on the conversion of heavier hydrocarbons to lighter ones of greater value, while the polymerization process is in principle the reverse, viz., the conversion of gaseous hydrocarbons to liquid ones in the form of high anti-knock motor fuel. In other words, the objective was attained and, in addition, it was found that a super-type of motor fuel could be produced.

How this development fits into the picture of automobile and aviation development can be readily illustrated. The demands of the automobile and aircraft industries for high-octane (anti-knock) fuel have increased from year to year. Since 1925 the maximum automobile speed has gone up from 60 to more than 100 m.p.h., and the cruising speed of aeroplanes from 80 to 220 m.p.h. Such increases would have been impossible without high-octane motor fuels. The requirements of automobiles may generally be satisfied by fuels of a value less than 75 octane. For aeroplanes, however, fuels of 95 and 100 octane are desirable, and for military purposes are necessary. Through the polymerization process such aviation fuel can be made. The great refining capacity of the United States will yield, it is estimated, an annual output of over 9,000,000,000 gals. from hydrocarbon gases.

With world diplomacy largely being built around aircraft effectiveness for defence, it becomes apparent that the 100-octane aviation fuel, which gives the aeroplane increased power, speed and load-carrying capacity, is today one of the world's most important strategic products.

(L. M. F.)

**Great Britain.**—Over 97% of the gasoline used in the United Kingdom in 1937 was consumed by the motor industry, and, of the total, 91.3% was imported refined gasoline, on which there was a duty of 8d. per gallon, and the remainder was produced at home by the refining of imported crude petroleum and from the treatment of coal and Scottish shale. The latest available statistics show that while gasoline imports increased by only a little over 1% in 1936, they rose 8% in 1937, while home production, encouraged by a preference of 8d. per gallon, is increasing

more rapidly. In the year 1935, in which there was abnormal development in the "oil from coal" industry, it stood as high as 5%, and although it fell in 1935—a more normal year—to 17%, the figure for 1937 is well over 20%. The 3% of light gasoline not absorbed in the motor industry is used in the heavy chemical, dry cleaning, solvents and dyestuffs trades.

Present-day motor fuels have benefited from the persistent research of petroleum technologists, mainly in the direction of anti-knock qualities, while British-produced gasoline has been greatly improved by the development of new processes, the most notable of which is the hydrogenation plant of Imperial Chemical Industries, Ltd., at Billingham-on-Tees, now producing nearly one-third of the total British output, which is marketed by the principal gasoline distributors. Of the 105,000,000 gallons produced from indigenous materials in the United Kingdom, 50,000,000 are from the gasworks and coke ovens, 33,000,000 from Billingham, and several million gallons from low-temperature carbonization and other "oil from coal" plants which aim at making the country less dependent on imported gasoline.

In 1937 the United Kingdom imported 1,356,185,000 gals. of gasoline, valued at £25,586,210, showing increases of 6.9% in quantity and 28% in value over 1936. With 169,000 more vehicles in use, mainly private cars, the average monthly gasoline consumption was 122,468,000 gals., against 113,627,500 gals. per month in 1936.

The price of first-grade gasoline was 1s. 6d. per gallon (including the 8d. tax) at the beginning of the year and 1s. 7d. in December, having touched 1s. 7½d. during the second quarter; but the price fluctuation had no appreciable effect on demand, the monthly figures pursuing the normal seasonal curves, the holiday months being the heaviest.

(A. C. CR.)

**Gasoline Tax.** The history of the gasoline tax in the United States during the year 1937, and indeed for a series of years, is the same old story. It has been increased—Minnesota from three cents to four cents; in New York from three cents to four cents; in Rhode Island two cents to three; in West Virginia from four cents to five. Temporary rate increases which had been scheduled to expire were continued in some States. Various taxes have been levied on other motor fuels in some of the States, particularly California and Kansas. Levied originally as a tax for the support of roads, this tax has proven so productive that more States are succumbing to the temptation to utilize it for other governmental purposes. In New York State two cents of the four which are collected are diverted to the general fund. Illinois had diverted \$2,000,000 for schools; and New Jersey has diverted \$7,900,000 for unemployment relief.

The yield of the gasoline taxes levied by States increased \$3,000,000 in 1937 over 1936. The growth of the tax over a series of years and its stability during the depression are truly marvelous. In only two years—1932 and 1933—were the collections of State gasoline taxes below the high point previously reached. And that high point came, not in 1929, when the total income from this source was \$491,000,000 for the entire country, but in 1931, when it exceeded \$536,000,000. Even in 1932, the lowest year, the yield was \$513,000,000. And by 1937 it had attained the sum of \$769,000,000. This is approximately six dollars per capita for every man, woman, and child in the United States. The rapid growth of this tax is astonishing. It was almost as high in 1937 as it had been in 1929; it was three times as high as it had been in 1927; and four times in 1926. It was five times as high as it was in 1923. The tax practically had its beginning in the year 1919, when the total collections from this source amounted to the modest sum of \$1,022,514. It is now 60 times that. (See also TAXATION.)

(D. F.)

**Gay, Walter** (1856–1937), American painter and dean of American artists in Paris. A brief account of his life appears in the *Encyclopædia Britannica*, vol. 10, p. 80. He died in Paris, July 15, 1937.

**Gdynia:** see DANZIG.

**Geddes, Sir Eric Campbell** (1875–1937), British industrialist, who was First Lord of the Admiralty during 1917–18 and who at the time of his death was chairman of Imperial Airways, the Dunlop Rubber Company, and 14 allied companies. The *Encyclopædia Britannica*, vol. 10, p. 84, gives the story of his career. He died at Hassocks, Sussex, June 22.

**Gems and Precious Stones.** The year 1937 witnessed no startling find of gems nor the production of any outstanding "gem of the year." Fashion is still rather shy of coloured gems, favouring ornaments of platinum-mounted diamonds. Whether this is due entirely to a wave of modern taste demanding a monochromic effect in ornament, a scarcity of fine-coloured stones, or merely the fickleness of public taste, it is impossible to say. Jewellers have made great use of the baguette or baton-cut diamond to produce pattern and variety in design, and this has definitely reduced the demand for coloured gems of moderate size and quality. Fine specimen stones will always secure attention and purchasers, but others remain at the mercy of the market. (See also DIAMONDS.)

**World Production.**—The Colombian mines being shut down has reduced the supply of emeralds of good quality. A few stones were produced at Leysdorp, South Africa, and there is news of a Swiss company having reopened the Habachthal mine in Austria, but no details of production. Fine emeralds maintain a high value, as do rubies, from sheer scarcity. The ruby production from the Mogok district in Burma, which amounted to about 30,000 carats in 1934, including the finds of native and local miners, continued this activity, but the death on Nov. 9, of Lieut.-Colonel J. F. Halford-Watkins, of Burma Mines, Ltd., a great local character and an eminent gemmologist, is certain to have an adverse effect on output. Burma produces annually about 105 tons of jadeite, most of which goes to China for working and carving. The value is about 3,000 rupees a ton.

The regular output of sapphires approximates 1,000,000 carats from Kashmir. The year's find in Queensland, Australia, is valued at £3,500. The use of amber received attention in Germany, national propaganda being aimed at a greater consumption for ornamental use. To counter-balance a drop in exports, chemists are seeking commercial and industrial uses for amber and its derivatives. The output at Samland, in Prussia, is steady at about 1,350 troy pounds annually; additionally about one-fourth of that amount is mined in Burma.

Two new instruments of value to students were introduced during 1937: a gem magnifier, by Leitz of Wetzlar, which facilitates the internal examination of faceted stones, and a simplified and smaller refractometer by Rayner and Keeler of London. In view of its increasing popularity as a gem, an exhaustive study was made of the zircon by B. W. Anderson and C. J. Payne, to which Prof. Dr. Karl F. Chudoba added the results of important investigations and recent discoveries explaining "wide diversities in the physical properties" of the stone.

Dr. Reinhard Brauns, author of *The Mineral Kingdom*, distinguished gemmologist of Bonn university, died on Jan. 28, 1937. (See also MINERALOGY.)

**Genetics.** The scope of researches included under the term genetics has continued to widen very markedly during the past year, and the use of genetically controlled materials and genetic techniques by biologists in general has developed greatly. The latter phase has been most marked in cancer research, as pure strains of mice and rats differing widely in susceptibility or resistance to the spontaneous occurrence of tumours of various types are now available. The uniformity of behaviour within strains and the great diversity between them enables more precise results to be obtained with fewer experimental animals. One striking development has been the discovery that mice of resistant strains develop a higher proportion of breast tumours if suckled by females of a susceptible strain, and that, conversely susceptible strains are much more resistant if fostered on resistant females. This experiment has been carried a step farther by the removal of fertilized eggs from susceptible females, and their implantation in resistant females. At the time of the last report, though many of them were past the earliest cancer age, none had yet developed tumours, but enough of them had not lived long enough for a definite statement to be made on their degree of resistance. (*See also* HEREDITY.)

In applied genetics, the possibilities have been realized of using colchicine to double the chromosome number. When wide crosses are made between distinct species or genera, the hybrid progeny are usually sterile. Often their sterility is attributable to failure of pairing between the chromosomes of the two parents at the time of germ-cell formation. This prevents the hybrids from forming functional gametes or germ cells. When the chromosome number is doubled in such hybrids, each chromosome obtains a completely homologous mate with which it can pair, and, in plants, such doubled (allopolyploid or amphidiploid) hybrids are usually quite fertile. Doubling often occurs spontaneously, and it has also been produced by heat shocks and, in certain plants, by decapitation. Colchicine appears to provide a new, easily applied method. It therefore promises to be of wide use in plant breeding. At Harvard university a Foundation has been established for the production of tree hybrids. In Canada, tree breeding work is being undertaken in combination with plant hormone treatments which stimulate root development on cuttings and thus enable sterile hybrid varieties to be propagated vegetatively or asexually. The hybridization of wheat with various related species of grasses is being continued in the United States, Canada, and Soviet Russia, in particular, with fair prospects that large-seeded, drought-resistant types of grasses or cereals suitable for semi-arid areas may be developed. The U.S. Department of Agriculture in its 1936 and 1937 year-books has given a most complete account of genetic methods and results in plant and animal breeding. Considerable progress has been made in various countries in the breeding of disease-resistant varieties of wheat and bananas, as well as less spectacular improvements in many crops.

In Britain, co-operation between the Medical Research Council Committee on Human Genetics and certain hospitals to the end that more extensive knowledge of the effects of cousin marriages may be obtained, has been established. It is known that certain rare diseases are more commonly found among the offspring of blood relations than in the general population, but very little information is yet available in the relation of intermarriage to the general health of the offspring. An American investigation on the inheritance of allergic disease (asthma, hay-fever) has indicated that it may depend upon the action of a single pair of genes. Individuals of the genotype HH are pure normals; those of hh are pure for the allergic condition, and they develop al-

lergic disease early in life; individuals of genotype Hh may never develop the disease, or may do so only after puberty—whether they do so or not they transmit it on the average to one-half of their offspring. A further study failed to reveal any evidence of genetic linkage between the genes determining allergic disease, the AB blood groups, the MN types, and eye colour.

**Geographical Society, American:** *see* AMERICAN GEOGRAPHICAL SOCIETY.

**Geology.** One of the most important events marking the progress of geology in 1937 was the meeting of the International Geological Congress in Moscow. This gave unprecedented opportunities for geologists from all over the world to see, at first hand, some of the great amount of excellent geological work carried out recently in Soviet Russia. The program included an exceedingly comprehensive list of excursions to such localities as the Kola peninsula, the Ural mountains, the Caucasus, Novaya Zemlya, and Siberia.

Turning to the various branches of geology, the following have been the most conspicuous lines of advance in recent years.

**Physical Geology.**—Our scanty knowledge of the ocean floor has been considerably increased by the work of such expeditions as the Snellius (Dutch) and the Murray (British). Improved methods of combining sounding with sampling, and the detection of gravitational anomalies have indicated a tectonic origin for the great ocean deeps, while important confirmation has been obtained of Darwin's subsidence theory for the formation of coral reefs. From the improved samples now obtained from the sea bottom new hypotheses have evolved for the origin of the great submarine canyons which cut into the continental shelf off some river mouths.

On land, the investigation of both valley glaciers, *e.g.*, in Alaska and the Pamirs, and of the continental ice-sheets of Greenland and Antarctica, has shown marked progress, being greatly aided by the seismic methods of ice-sounding now employed, and also by the use of aerial photography.

**Petrology.**—Of all branches of geology, petrology is in by far

**FISSURES** in Buena Vista Peak, Los Angeles, California, give timely warning of an impending and dangerous landslide

**HEAT FIELDS** of Harley Robertson, a southwestern Idaho farmer, slowly sinking and forming a steadily-widening canyon, owing to the collapse, geologists explain, subterranean caverns created millions of years ago by lava flow

**LANDSLIDE** of 1,500,000 tons of rock and earth on Buena Vista Peak, Los Angeles, California, which wrecked a Riverside Drive viaduct and endangered homes and shops

the most chaotic and undeveloped state, but it provides, therefore, the most scope for progress. The question of the classification of the igneous rocks presents a perennial problem which seems incapable of solution at present, although many ingenious schemes, mainly arithmetical in basis, have recently been put forward. Unfortunately it cannot be said that the efforts of committees for the reform of petrographic nomenclature (on both sides of the Atlantic) have been conspicuously successful.

A great deal of work has lately been carried out by British geologists on the origin of certain granite masses, and has resulted in conflicting theories, all of which are of interest. Following on recent investigations in Britain and the northern Appalachian chain, the widespread distribution of ring-structure in plutonic complexes is receiving recognition.

An important line of attack applying to igneous, sedimentary, and metamorphic rocks alike is the microscopic technique devised by B. Sander (Austria), who correlates the internal optical structure of crystals with their history of deposition or metamorphism. Both this method and the system of directional field observations initiated by H. Cloos (Germany) have been employed with striking success in America.

A great amount of descriptive petrographical work continues to appear, and its quality shows constant improvement owing, largely, to the increasing use of the universal stage for the determination of the optical properties of minerals and to the employment of various ingenious instruments now available for estimating the volumetric proportions of minerals in thin sections with rapidity and moderate accuracy. Experimental work carried out in America on silicate systems has added greatly to our knowledge of the pyroxene and amphibole groups of minerals.

**Historical Geology.**—The progress of stratigraphy is steady though not startling. Among the most notable developments has been the conspicuous success of "graded bedding" methods of solving some of the major stratigraphical problems of the Scottish Highlands.

L. de Toit, *Our Wandering Continents* (Edinburgh, 1937); W. B. Wright, *The Quaternary Ice Age* (second edition, London, 1937). (F. WAL.)

**George VI** (1895– ), King of Great Britain and Ireland; second son of King George V; born at Sandringham, Dec. 14, 1895, was trained for the Royal Navy, with which he served in the World War, was created Duke of York in 1920, and on April 26, 1923, married Elizabeth (*q.v.*), daughter of the earl of Strathmore. On the abdication of his elder brother, Edward VIII (see WINDSOR, EDWARD, H.R.H. DUKE OF), he succeeded to the throne on Dec. 11, 1936. On Dec. 14, His Majesty issued an

accession message to parliament, and on the 18th assumed supreme rank in the army, navy, and air force. On New Year's day, 1937, King George sent a message of greeting to the empire. On Feb. 9 the first levée of the reign was held at St. James's Palace, and on the 15th, King George went into residence at Buckingham Palace, after having two days previously been enthusiastically received in the East End of London when visiting the new People's Palace there. The early part of 1937 was largely taken up with preparations for the coronation, which took place at Westminster Abbey on May 12, amid scenes of unexampled enthusiasm, repeated in London on the occasion of the royal drives through the streets on the following days. On the 20th, the King held a review of his fleet at Spithead, and on May 24, with the royal family, attended a thanksgiving service at St. Paul's cathedral. He followed the royal custom of attending the Derby at the Epsom race-meeting at the beginning of June. From July 5 to 11 King George was in Scotland, holding two courts at Edinburgh and on the 14th and 15th visited Cardiff, Newport, Swansea, and other Welsh centres. A state visit to Belfast followed on July 28. But in spite of the press of state engagements, His Majesty found time, on Aug. 3, to spend a day at the Southwold annual holiday camp for public school boys and youths from the works and factories, which he himself had inaugurated when Duke of York, and which he had never failed to visit.

From early August to early October, King George stayed at his Scottish seat of Balmoral, and on his return visited industrial Yorkshire on Oct. 20 and 21, returning to London to open parliament in state for the first time on Oct. 26. Continuing the practice initiated by his father, the King issued a broadcast message to his people on Christmas day, expressing his hope that peace and goodwill might speedily prevail in world affairs and in the lives of his subjects.

**Georgia**, one of the original States of the United States, popularly known as the "Empire State of the South"; area 59,262 sq. mi., being the largest east of the Mississippi river; population according to the U.S. census of 1930, 2,908,506, estimated July 1, 1937, 3,085,000. Capital, Atlanta, 270,366, estimated July 1, 1937, 280,400. The next largest city is Savannah, 85,024, with Augusta, Macon, and Columbus as other important cities. Of the State's population 895,492 are urban, or 30%; 1,836,924 whites; 1,071,125 coloured; 407 other races; 13,917 foreign-born.

**History.**—In Nov. 1936, E. D. Rivers in a campaign of support for the New Deal was elected governor. As the Democratic party has no opposition in State elections, the political contest took place in the nominating primaries in September. The county unit system of voting prevails, whereby the smaller counties have

one vote each and the most populous only three. In this election Rivers received 360 votes to 44 for his two opponents. In June, 1937, 20 amendments were adopted by a vote of the people. The most important items related to old age pensions and the classification of property for purposes of taxation. In the same election the abandonment of prohibition

**BEGINNING OF A FISSURE** on an Idaho farm, which is gradually sinking into subterranean caverns **FIVE DAYS AFTER** the appearance of the six-inch fissure in the picture at the left it had widened into this crevasse

as defeated 94,575 to 23,097. In pursuance of these amendments, laws were passed setting up old age pensions, classifying intangible property and setting lower rates of taxation than those on real estate, and exempting from taxation homesteads up to \$2,000 and household furniture to \$300. The principal State officers were: E. D. Rivers, governor; John C. Wilson, secretary of State; M. J. Yeomans, attorney-general; George

Hamilton, treasurer; Tom Wisdom, auditor; William B. Harrison, comptroller; M. D. Collins, superintendent of schools, and Columbus Roberts, commissioner of agriculture. The chief justice of the Supreme Court is Richard B. Russell, Sr.

**Education.**—The State supports higher education through the University System of Georgia, consisting of 19 units, the principal ones being the University of Georgia (Harmon W. Caldwell, president) and the Georgia School of Technology (Marion L. Brittain, president). At the head of the system is a chancellor (Steadman V. Sanford). In 1936 the legislature appropriated \$3,580,000 for the system.

**Banking and Finance.**—The common schools received \$7,758,000 from the State treasury in 1937. For the various elementary institutions the appropriations were \$1,557,000. The highway department received \$19,106,000. All appropriations are for 10-year periods. The total revenues received in 1936 were \$30,445,000, the tax on motor fuel producing \$17,526,000. Other important sources were general property \$3,585,000, manufactured tobacco \$1,512,000, motor vehicles \$1,306,000, and business licenses \$1,000,000. In 1936 there were 226 banks with resources \$165,090,510.

**Agriculture, Manufacturing, Mining.**—In 1935 there were 20,544 farms and 164,331 croppers and tenants. The principal crops were wheat, 1,430,601bu.; oats, 1,428,729bu.; corn, 38,036,46bu.; cotton, 971,468 bales; sugarcane, 291,037 tons; tobacco, 1,671,213lbs.; Irish potatoes, 1,228,491bu.; and sweet potatoes, 961,963bu. The State had at the same time 25,180 horses, 333,99 mules, 1,100,138 cattle, 33,580 sheep, and 1,272,763 swine. In 1935 there were 2,858 manufacturing establishments with 142,488 wage earners, receiving \$85,570,215. The value of the products was \$523,294,587, cotton goods being the principal output, amounting to \$157,759,372. The value of the output of mines and quarries was in 1935 \$7,440,226, with granite, clay, marble, and limestone as the principal production. (E. M. C.)

**Georgian S. S. R.** A Soviet republic in the Western Transcaucasus on the Black sea, a member of the U.S.S.R. (*q.v.*), bordering N. and E. on the U.S.S.R., and S. on Turkey and the Transcaucasian republics of Armenia and Azerbaijan. Georgia is known to the Russians as *Georgiia*. The capital is Tbilisi (formerly Tiflis), and the national flag has a red ground with the name of the republic in gold in the top left square. Leading cities, with 1936 populations, are: Tbilisi, 445,100; Batumi, *c.* 100,000; Kutaisi, 72,300; and Poti, 60,000.

**Area and Population.**—Area: 70,000 sq.km. Population (1936): 3,232,000 (Georgians 68%, Armenians 11.6%). The

EURITH DICKINSON RIVERS, governor of Georgia

languages spoken are Georgian, Armenian, Abkhazian, Ajarian, Osetian, and Russian. In 1936–37 there were 4,053 schools, with 658,000 scholars and 19,000 teachers; 19 higher educational institutions, with 20,000 students; 2,000 professors and lecturers; and 120 research institutes.

**History.**—On Feb. 13, 1937, the Eighth Extraordinary Georgian Soviet Congress in Tbilisi adopted the new constitution for Georgia. From now on, since the dissolution of the Federation of Transcaucasian Republics, the Georgian S.S.R. belongs directly to the U.S.S.R. as an equal, independent Union republic, and includes the Abkhazian A.S.S.R., the Ajar A.S.S.R., the South Osetian autonomous province, 50 districts, and 2 separated towns.—Tbilisi and Poti. Ninety-six per cent of the population took part in the elections to the Supreme Council of the U.S.S.R. on Dec. 12. A number of prominent Georgian Old Bolsheviks and high state and local officials (including the premier of the republic, Magaloshvili, and his deputy) were shot in the summer of 1937 on charges of treason, terroristic conspiracy, and counter-revolutionary activities. In the Ajar A.S.S.R., also in Oct. 1937, the president and seven other officials were condemned to death for alleged plotting of an armed rising with a view to separating the republic from the Soviet Union.

**Trade and Communication.**—Sown area (1936): 3,633 sq.mi. In 1937, 76.5% peasant households were collectivized. The main activities are fruit and vine growing, silk culture, tea plantation (output, 1936, 20,000,000kgm.), tobacco plantation, grain production, and cattle breeding. Natural resources include oil, coal, manganese, timber, mineral springs (medicinal baths), and water power from rivers. The retail trade turnover (1936) was 1.9 milliard roubles, and the output of industry (1936—at prices 1926–27) was 798,000,000 roubles. The length of railway lines (1936) was 927km., including the electrified line from Tbilisi to Dzhugeli (183km.). There are several mountain motor roads. (S. YAK.)

**German Literature.** In the realm of literature, as in everything else, National Socialism has sought to organize, control and direct. All writers in Germany must belong to a branch of the Reich Culture Chamber of which Dr. Goebbels (*q.v.*) is the head. Prizes and distinctions are given to those whom he deems worthy; *i.e.*, to those whose literary interpretation is in accordance with the National Socialist ideology. Addressing German booksellers in the spring of 1937 he declared that the days were over when the possession of books was the exclusive privilege of the wealthy and intellectual classes. Therefore 760 new circulating libraries were established in smaller towns.

Although it cannot be said that Nazi patronage has stimulated successfully the writing of any works of great literary distinction, there have been changes in the character of German literature. Most important from the Nazi point of view has been the suppression to a considerable extent of works by Jewish and liberal writers, many of whom have left Germany. As to types of literature still published in Germany, there has been a decline in natural science, philosophy and religion, and an increase in political and military works and in historical novels, especially those dealing with German peasants and regional life.

Among the novelists, Hans Friedrich Blunck (1888– ), long popular because of his devotion to themes from the Nordic sagas, received official recognition after the Nazi revolution by his appointment as president of the German Writers' Society. His story of the King of the Vandals, *König Geiserich* (1936), pictures a great leader and a people of warlike qualities and pure morals upon whom Germans can look back with pride; it is interesting, based on a careful study of the documents, and not obtrusively

propagandist. Hans Carossa (1878– ), author of *Geheimnisse des Reifen Lebens* (1936), is a Bavarian doctor who gives his novels of South German village life the form of a journal in which the plot is delightfully interspersed with allegory and philosophical diversions. More humorous and closer to the soil are the pictures of Bavarian peasants by Ludwig Thoma (1867–1921) in *Andreas Vöst*, *Der Wittiber*, *Altaich*, *Lausbubengeschichten* and other popular novels which appeared many years before the Nazis came to power; his seventieth birthday was happily recognized by the reprinting of his shorter stories of Bavarian rural folk, *Meine Bauern* (1937).

The tendency toward regionalism is seen in Jakob Kneip (1881–). His *Porta Nigra* (1932) is the account of a young man who gave up the priesthood in order to volunteer in the World War. In his *Feuer von Himmel* (1936) the same young man returns to his home to find ruin and despair, which he helps to overcome. Another novelist of the war is Edwin Erich Dwinger (1898–). He was born in Kiel of a German father and Russian mother, captured during the war, and imprisoned in Siberia. His half-Russian origin and early acquaintance with Bolshevism gives the psychological and factual background for an intensely patriotic trilogy, in which he describes life behind barbed wire (*Die Armee hinter Stacheldraht*), the conflict between the Kolchak whites and the Trotskyite reds (*Zwischen Weiss und Rot*), and his return home (*Wir rufen Deutschland*). Volk ohne Raum by Hans Grimm (1875–), inspiring to the youth of an overcrowded Reich, is probably the most successful novel; though first published in 1926, its sales have steadily increased and reached by 1937 a total of nearly 400,000.

A notable and excellent historical work is that of the Karlsruhe schoolmaster, Franz Schnabel (1887–), *Deutsche Geschichte im 19. Jahrhundert* (4 vols., 1929–37); this history of Germany in the 19th century written from the Liberal South German and Roman Catholic point of view, is an invaluable counterpart to Treitschke's older Protestant Prussian work of the same title.

From their exile outside Germany valuable contributions to her literature continue to be made by Thomas Mann, Heinrich Mann, Bruno Frank, Lion Feuchtwanger, Stefan George, Theodor Wolff, Stefan Zweig, and others. See *Books Abroad*, a quarterly published by the University of Oklahoma Press. (S. B. F.)

**Germany**, a totalitarian State or dictatorship, known as the Third Reich, in Central Europe south of the North and Baltic seas and north of the Alps; bounded on the west by

GERMANY: Industrial production index (The Annalist)

France, Belgium and the Netherlands, and on the east by Czechoslovakia, Poland and Lithuania. Since 1919 East Prussia has been separated from the main territory of Germany by the so-called Polish Corridor. Capital, Berlin; Reich Chancellor and Leader (*Führer*), Adolf Hitler (*q.v.*).

**Area and Population.**—The area is 181,742 sq.mi.; population 66,029,000, June 16, 1933; estimated 67,300,000 (Jan. 1, 1938). In 1933 there were 32,086,000 males and 33,943,000 females. There were 756,760 foreigners, a little more than 1% of the total population; the chief foreign elements, in per cent of total foreigners were: Czechs, 24.6; Poles, 19.6; Austrians, 10.7; and Swiss 5.2. The population was distributed among the 18 "Lands" (former States) and among the chief religious denominations in 1933 as follows:

Lands	Total pop.	Evangelical	Rom. Cath.	Jews†	Others
Prussia . . . . .	39,692,167	25,387,595	12,571,007	361,826	1,613,533

\*Census of 1935. †Jews by religious faith; there are no census figures for Jews by blood; it was estimated that by the end of 1937 the Jews by faith had been reduced to less than 400,000.

There were (1933) 104 cities with a population of more than 50,000 each, and 567 cities and towns with more than 10,000 each. 32.5% of the population lived in villages of less than 2,000; 10.6% in towns of between 2,000 and 5,000; and 7.3% in towns of between 5,000 and 10,000; almost half the population lived in communities of more than 10,000. The cities with more than 500,000 on Jan. 1, 1937, were: Berlin, 4,251,000; Hamburg 1,097,000; Cologne, 762,000; Munich, 756,000; Leipzig, 698,000; Essen, 662,000; Dresden, 637,000; Breslau, 625,000; Frankfurt am-Main, 551,000; Dortmund, 540,000; and Düsseldorf, 515,000.

**History.**—The inner political history of Germany has been the progressive consolidation of many small States into fewer and fewer large ones. At the close of the Middle Ages Germany consisted of some 300 political territories, varying in size all the way from large States like Austria, Brandenburg and Saxony to the tiny principalities of the Free Knights with a few square miles and a score or two of inhabitants. As a result of the French Revolution and the Napoleonic upheaval, these 300 political units were consolidated into the 39 larger States which formed the German Confederation of 1815. Bismarck, by expelling Austria and annexing several territories to Prussia, reduced the number to 25 in the German Empire which he founded in 1871. As a result of the World War the number was further reduced to 17 in the Weimar Republic of 1919; they were henceforth known as "Lands" (*Länder*) and were shorn of some of their power which was transformed to the Central Government of the Republic. Under Hitler Mecklenburg-Schwerin and Mecklenburg-Strelitz were consolidated as Mecklenburg, and the Hanseatic town of Lübeck was incorporated into Prussia, thus making 15 Lands, or after the return of the Saar Territory to Germany in 1935, 16, as appears in the table above.

Hitler carried the consolidation process to its final step. Though the Lands still exist as administrative units, he has virtually united them into a single, centralized, unitary State. He rules from a single capital, Berlin. He has made the Third Reich "one and indivisible," thus accomplishing for Germany what the French

evolution accomplished for France. His Reconstruction Act of Jan. 1934 passed unanimously by the Reichstag without debate, abolished the State legislatures, transferred all state sovereignty to the Reich, and subordinated the State cabinets directly to the national cabinet. In many cases the State departmental ministries have been abolished and incorporated into the central ministry of the Reich; this process of incorporation, which involves a great many administrative details, is still going on.

Hitler as supreme Leader rules each Land through an appointee known as *Statthalter*, or through a State minister-president. An Act of Jan. 1935 transferred to Hitler the unqualified authority to appoint and dismiss the personnel of the State cabinets, which continue to operate as regional executive divisions of the Reich so far as the departmental ministries are not consolidated with the central ministries of the Reich. The local government of the municipalities or communes (*Gemeinde*) is also being made uniform for the whole Reich and placed under the direction and control of the Reich minister of Interior. Communal self-government has been suppressed; an appointed burgomaster is responsible for the town administration; he is advised by unpaid honorary councillors. The "leadership principle," involving complete responsibility to the appointing officer above and proper solicitude and care for all those ruled below, permeates the whole Reich. Thus, both in the machinery of the German State and of the National Socialist Party, the officials form a hierarchy or pyramid, with Adolf Hitler as the Reich Chancellor and Leader at the apex. Below him in the State are the Reich cabinet ministers, the *Statthalters* in the Lands, and the burgomasters in the towns. Below him in the Party are the 33 Provincial Leaders (*Gauleiter*), and the leaders in each of the 760 districts (*Kreisen*), 21,345 local groups (*Ortsgruppen*), 74,091 "cells," and 397,040 "blocks."

Parliamentary government was swept away soon after Hitler became Chancellor on Jan. 30, 1933. The burning of the Reichstag building on February 27 gave the National Socialist Party the pretext for arresting Communist deputies and functionaries, for suppressing Social Democratic newspapers, and for using strong-arm methods for rendering impotent all opponents of National Socialism. In the Reichstag elections of March 5, Hitler's cabinet, representing a coalition of National Socialists and Nationalists, won 52% of the votes cast in a total poll of about 50% of the electorate. With this majority Hitler had the Reichstag pass the Enabling Bill of March 23 by which the Reichstag lost its own grave.

The Enabling Bill vested the cabinet with full legislative powers for four years and permitted it to set aside the provisions of the constitution protecting personal liberty. Thereafter the Reichstag was occasionally summoned to hear and approve without discussion Hitler's more important decrees. The old political parties were either forced by the National Socialists to dissolve "voluntarily," or were suppressed, thus leaving the National Socialists in complete control. Germany became a one-party State. The Reichstag elections of Nov. 12, 1933, and of March 29, 1936, were therefore a farce as the expression of the wish of different political groups, for there were no candidates except National Socialists; these were endorsed by 92.1 and 98.8% respectively of the electorate. Once elected the Reichstag is of virtually no importance, for in the last three years it has rarely been summoned and has no power when it meets. The Reconstruction Act of Jan. 1934 granted the cabinet the sweeping authority of "creating new constitutional law." Thereafter legislation assumed more and more the form of government by decrees whose details may be worked out by the cabinet, but whose general purpose, in accordance with the leadership principle, represents the dictatorial authority of the Reich Leader, Adolf Hitler.

The Reich cabinet contains most of the same men as in the

PRODUCTION OF ALUMINIUM in Germany

early months of the Nazi Revolution, but has been enlarged by additional members. It comprised in Jan. 1938 the following ministers with their respective departments: Baron von Neurath (Foreign Affairs); Wilhelm Frick (Interior); Paul Joseph Goebbels (Propaganda and Enlightenment); Schwerin von Krosigk (Finance); Walther Funk (Economics); Franz Seldte (Labour); Franz Gürtner (Justice); Werner von Blomberg (War); Hermann Göring (Aviation); Walter Darré (Agriculture); Bernhard Rust (Education); Hanns Kerrl (Church Affairs); Wilhelm Ohnesorge (Post Office); Julius Dörmüller (Transportation); and four ministers without portfolio—Rudolf Hess, Hjalmar Schacht, Hans Frank, and Heinrich Lammers.

No idea of the government and recent history of Germany would be complete without some account of the Nazi (*q.v.*) Party. Its program is given under National Socialism (*q.v.*). Though comprising only about 5% of the German people, the Nazi Party virtually controls and directs the Totalitarian State through four main functions which it efficiently fulfills. (1) The Party provides nearly all the officials of the State, owing to the fact that Adolf Hitler stands at the apex of both organizations and directly or indirectly appoints all officials. Preference is given to "old fighters"; i.e., faithful and reliable men who joined the Party in the early days, and to young men who have been sifted in the Hitler youth and other Nazi organizations. (2) The Party maintains elaborate organizations, more or less paralleling the institutions of the State, for directing and propagandizing factory workers, craftsmen, peasants, professional classes, civil servants, war-wounded—in fact virtually all social groups. Membership in these is sometimes compulsory, sometimes "voluntary," but always advisable if one wishes favourable treatment. (3) For inculcating Nazi ideals in the 9,000,000 boys and girls there are several Hitler youth organizations, as well as the half year of compulsory Labour service which precedes for youths the two years of military service. (4) For dealing with internal enemies there are the Nazi Brown Shirts (*q.v.*) under Viktor Lutze, and the Black Shirts or special secret police under Heinrich Himmler.

The main aim of Hitler's foreign policy at first was to free Germany of the humiliating limitations of the Versailles Treaty. This he has largely accomplished, with the exception of the territorial and colonial clauses. After he gave notice in Oct. 1933 of Germany's withdrawal from the League of Nations, he has followed the policy of making bilateral agreements, such as the treaty of friendship with Poland (Jan. 26, 1934), the naval agreement with England of June 1935, the anti-Communist agreement with Japan of 1936 (to which Italy adhered in 1937), and the friendly understanding with Fascist Italy which was manifested by Mussolini's spectacular visit to Germany in Sept. 1937.

**Trade and Communications.**—Since 1935 Germany's exports and imports have been very strictly controlled, first by Dr. Schacht's "new system," and then by Göring's dictatorial economic power as commissioner for the Four-Year Plan. The fact

that the table immediately below shows a favourable balance of 550,000,000 marks (about \$220,000,000) for 1936 does not mean that Germany acquired that amount of gold or foreign exchange, because about half of the trade was conducted through "clearing agreements," and a considerable part of the surplus of exports over imports had to be used to pay for goods bought or money borrowed in earlier years.

The volume and value of Germany's trade during the past six years and the balance of trade were:

	IMPORTS		EXPORTS		BALANCE
	Million tons	Million marks	Million tons	Million marks	
1932 . . . . .	44.1	4,667	53.9	5,739	+1,072
1933 . . . . .	45.8	4,204	52.1	4,871	+ 667
1934 . . . . .	54.2	4,451	55.1	4,167	+ 284
1935 . . . . .	56.7	4,159	59.7	4,270	+ 111
1936 . . . . .	60.9	4,218	62.2	4,768	+ 550
1937* . . . . .	—	5,468	—	5,911	+ 443

\*Figures for volume of trade not available.

The German State Railway (*Reichsbahn*) included in 1935, 53,330km. (33,076mi.) of standard gauge lines and 879km. (546mi.) of narrow gauge lines. Privately owned lines were 3,732km. (2,313mi.) of standard and 752km. (476mi.) of narrow gauge.
